electorally punish oppositional parties as much as governing parties for economic downturns. The situation is entirely different, however, when opposition parties have strong control powers and have exercised strong influence on the government's course. In this situation, voters might punish opposition parties electorally to a higher degree. As a second example of the importance of oppositional power, consider the field of coalition formation. Strøm (1984) claims that minority governments are more likely to form in systems "where policy can be influenced even from opposition status" (Strøm 1984, p. 213), that is, in other words, where oppositional (control) power is higher. Oppositional power thus also affects coalition formation processes. In short, oppositional power not only matters directly for the policy-making process but can also affect other important political phenomena.

In sum, oppositional power, that is, the degree of influence nongoverning parties or single members of parliament have on the policy-making process, is shaped by the institutional setting, on the one hand, and by the opposition parties' characteristics and behavior, on the other hand. Oppositional power has strong effects on important social, economic, and political outcomes. Despite this fact, oppositional power has not been studied extensively in political science and many important questions remain to be solved in future research. As Robert Dahl (1966, p. xix) pointed out already 50 years ago: "to examine the problem of oppositions is sometimes a matter of employing a new perspective to look at fairly familiar things." This chapter outlined that this, however, can be a highly fruitful endeavor.

# Organization of Public Procurement in Contracting Authorities

Matthias Einmahl
University of Public Administration for the Region of North Rhine-Westphalia (Fachhochschule für öffentliche Verwaltung Nordrhein-Westfalen), Gelsenkirchen, Germany

## Synonyms

Central procurement; Centralization; Formalization; Lead buyer; Maturity model; Specialization; Standardization

## Definition

Organization has four main dimensions relevant for procurement (Glock and Broens 2013; Pugh et al. 1968).

Centralization: The degree to which decisions and responsibilities are centralized (e.g., within a central procurement unit).
Specialization: The degree to which staff members are specialized to perform certain tasks (e.g., being in charge of certain products or a certain part of the procurement process such as the tendering procedure).
Standardization: The degree to which the process is streamlined (e.g., by using forms).
Formalization: The degree to which the process is subject to requirements that have to be followed (e.g., by internal procurement guidelines).

## Introduction

The organization of procurement is a major contributor for **procurement success** and as such often underestimated. User units (i.e., those units of the contracting authority who need and will use the product which has to be procured) tend to favor an organizational framework which will give them a maximum of control over the procurement process and its outcome, thus trying to limit the participation of other organizational units within the contracting authority to a minimum. This can obstruct or even prevent a degree of professionalism necessary to enable the pursuit of strategic goals, the choice of the right product meeting the needs of the contracting authority, a proper market analysis, compliance with public procurement law, the choice of the most economically advantageous offer, and an effective prevention of corruption.

## Centralization as Key Element of Procurement Organization

The key element of procurement organization is centralization, mainly through the establishment of a central procurement unit. To the extent of the assignment of competences to this central unit, centralization will automatically lead to specialization. The existence of a strong central unit will also facilitate standardization and formalization as staff members assigned to the central procurement unit will acquire the necessary know-how to develop sensible standard solutions and formal requirements.

## Describing Procurement Centralization Through a Maturity Model

Procurement centralization can be described through a maturity model which analyses the different functions of a central procurement unit within the organization. The most influential maturity model was proposed by Harland et al. (2007). This framework divides public procurement into seven stages (Harland et al. 2007, p. 351). It was originally designed to describe public procurement policies on a national level but can also be used as a model to categorize the public procurement approach within a single organization.

The *first stage* – namely serving the organization – focuses on the basic availability of required objects. Therefore, the main issue is to get the product in the right quantity at the right time at the right place. The central procurement unit is reactive and serves the organization in a **logistical nature**. Examples of tasks assigned at this stage could be the running of an ordering system or an electronic catalogue, the organization of goods delivery or the storage or goods.

The main objective of the *second stage* is the **compliance with legislation** which expresses a conformance of procurement actions with prevailing regulations. A classic focus of public procurement law is typically the tendering procedure, namely the publication of the procurement project, the transmission of bidding documentation to potential bidders, the reception of the bids, and the opening of the bids after the elapse of the bidding period. At the second stage, the central procurement unit will therefore typically be in charge of these procedural steps. A major objective of

regulations about the tendering procedure is the prevention of manipulation and corruption. Bids can be opened prematurely and the bidding details passed on to competitors. Bids can be modified before or after the opening in collusive action of a bidder and employees of the contracting authority. Sophisticatedly and correctly applied, public procurement law can prevent that. By putting a central procurement unit in charge of these procedural steps, they will be moved away from the user units which typically have closer links to potential bidders than a central procurement unit. Collusive behavior is thus made more difficult.

The *third stage* focuses on the **appropriate use of public funds**. In addition to serving the organization, the central procurement unit needs to make sure that the funds are used for what they are intended for. To ensure this, it is necessary to **prevent fraud and corruption** on a more advanced level than at the second stage. The focus has to shift to the earlier stages of the procurement process, namely to the following two: First, the choice of the bidding procedure, i.e., either an open procedure where every interested party can submit a bid, a restricted procedure where potential bidders are preselected by the contracting authority or a negotiated procedure which will allow the contracting authority to negotiate the contract with selected bidders. And second, the selection of potential bidders in procurement procedures other than the open procedure. Staff members working for the user unit can favor bidders or bidder cartels in these two stages by avoiding an open procedure and preselecting certain bidders on a regular basis while disregarding other potential bidders who would be at least as suitable as the favored bidders. This form of manipulation tends to be more pervasive and harming than the possible manipulation in the tendering procedure itself as described herein before. An involvement of a central procurement unit is especially possible when it comes to the choice of the bidding procedure. The central procurement unit can, for example, be given the authority to issue restrictive guidelines under which circumstances user units can deviate from the open procedure and opt for a restricted or negotiated procedure instead. A further safeguard would be a mechanism by which the central procurement unit must authorize any deviation from the open procedure. The involvement of a central procurement unit is more difficult to achieve when it comes to selecting potential bidders in a restricted or negotiated procedure because the central procurement unit will usually lack the technical expertise to fully assess the suitability of potential bidders. Examples of an involvement could be the task to run a database of suitable bidders open to every interested party, to define objective criteria upon which a decision about entry or denial of entry in that database has to be based, to check whether all members of this database get a regular chance to participate in restricted or negotiated procedures, and to have the authority to add, remove, or replace potential bidders from a bidder list in a concrete procurement project.

The third stage also sees responsibility of the central procurement unit not only for the process but also for the result. Special attention lies on **meeting the budget** and getting the most for a fixed amount of money. The central procurement unit will therefore also have the task to determine or at least influence the selection of the most economically advantageous bid. Examples of such in involvement could be to commonly decide with the user unit to which extent other aspects than the price (e.g., quality) will play a role as selection factor or to participate in selection committees. Overall, the commercial aspects become a major factor, even though the attitude is still reactive.

In the *fourth stage* – **accountability** – the public procurement department needs to make sure that processes are well designed and well executed in order to be able to purchase the required items, avoiding fraud and getting a good price. Consequently, **transparency** of the processes plays a role in addition to the aspects of the previous stage. At this stage, an internal procurement unit will typically be in charge of drafting or even issuing internal guidelines to be observed across the whole organization. It will furthermore usually have the authority to decide on procedural and legal matters, especially in the application of public procurement law or internal

guidelines, and to override wishes or decisions of the user units in that respect. It will finally typically collect data on public procurement activities within the organization which can serve as basis for the establishment of a controlling system, benchmarking or strategic decisions to be taken by the leadership of the organization.

At the *fifth stage*, the role of the central procurement unit starts to get **proactive**. It is **not a mere internal service provider** anymore – regardless of its competences – which reacts to demands of the user units. The definition of the needs continues to rest with the user units (e.g., school department needs new furniture). But beyond that point, the central procurement unit starts to get involved. It participates or even leads the next step, the market analysis. To this end, it will have specialists in his ranks who have good knowledge of the markets from which the contracting authority will get the needed products. Based on that (leading) participation, it will also participate in the design of the performance description or even design it itself. It will also play a leading role in defining the suitability criteria for potential bidders, the selection criteria for the most economically advantageous bid and finally in the process of assessing the bidders suitability as well as the in the decision for which offer to opt. All in all, it plays a crucial role in implementing a value for money philosophy within the organization. Procurement activities are fully professionalized at this point, though still internally oriented.

In the *sixth stage*, public procurement **aims to support policy goals** while at the *seventh stage*, it will **deliver** it. The public procurement function makes a direct contribution to the strategic goals of the organization. The achievement of strategic goals also has an external role to a certain degree. It is seen as an instrument for economic, technological (promoting innovations), or social reform and achievement of policy goals such as job creation and employment, strengthening the industry, involvement of SME, promoting diversity with regard to the supplier base, stimulating innovation, sustainability and social responsibility, or developing aid. At this stage, the head of the central procurement unit will have a strong position within the organization and possibly even be member of the managerial board of the organization. When discussing strategic decisions to be taken, procurement will regularly be examined as one possible tool to achieve defined objectives. If the result is positive, the central procurement unit will sometimes even be able to influence the very basis of procurement: the definition of the needs. As an example, the wish to enable a company to develop new technology might motivate a contracting authority to bring forward the replacement of certain products to an earlier date than originally planned and to equip itself with products using that new technology.

## Specialization

Procurement specialization can refer to the procurement process or to the goods to be procured. The classic example of a **procurement process** specialization would be a central procurement unit in charge of the tendering procedure as described in the chapter before. This example also shows the strong link between centralization and procedural specialization. Specialization on **procured goods** will see staff member with a good knowledge of certain markets (e.g., furniture, cars, computer hardware) in charge of market analysis and design of the performance description in all cases in which these goods need to be procured within the organization. This market specialists may be assigned to the central department unit. But they can also be employed in user units. A widespread solution is the so called **lead buyer concept**. In this concept, the market specialists work in those user units which have the most important need for certain products. An example would be a municipal police department which will traditionally have the biggest demand for cars in a municipal administration. The car market specialist(s) would then work in the police department and be in charge for the procurement of cars across the whole administration. The idea behind this is that a good expertise of certain markets will

already exist within the user unit with the biggest needs for products from this market and that is therefore the most efficient solution to establish the lead buyer for that market in that user unit. If some products are needed across the whole administration with no already existing competence cluster within one user unit, the lead buyers will often be assigned to the central procurement unit. A classic example for such a product would be energy. Thus, lead buyer concepts often have a mixed structure: Some lead buyers work in user units while others work in the central procurement unit. The lead buyers within the user units must not necessarily be under the authority of the central procurement unit when it comes to procurement issues. If they are not, the central procurement unit will be weaker and usually display a lower degree of centralization maturity as described in the chapter above.

## Standardization and Formalization

The classic standardization tool is the use of forms. But the most important instrument for standardization today is **e-procurement**. The more the procurement process is software based and guided, the more it will be streamlined. E-procurement which will also increase transparency, make manipulation more difficult (especially of the tendering procedure itself), reduce errors and will therefore be characteristic for a higher level of centralization maturity.

Very often the use of forms or procurement software will be **mandatory** which will also formalize the procurement process. The main formalization instrument is however the issuing of **internal regulations** specifying public procurement law by limiting the leeway given by the law for the user unit. An example would be internal guidelines which would prescribe an open procedure as standard procedure above an estimated contract volume of 100.000 $ while public procurement law would allow contracting authorities to forgo an open procedure below a threshold of 500.000 $ and opt for a restricted of negotiated procedure instead.

## Discussion

As pointed out before, the question of **centralization** is the starting point of any reflection about the organization of procurement within an organization. Centralization is the basis for **specialization** of staff members. Specialization gives these staff member more opportunities to **familiarize themselves** with all the complex issues which have to be taken into account in professional procurement, namely public procurement law. This in turn has the following **advantages**:

- The probability increases that the most economically advantageous solution will be found.
- Compliance with public procurement law is easier to achieve.
- Process costs are reduced as routine will enable the staff members to carry out the required work in less time.

Centralization also offers better possibilities to identify **similar needs** within the organization which can be bundled up in common procurement projects, namely **frame agreements**. This avoids a duplication of work and opens the opportunity to secure discounts as a consequence of a higher procurement volume.

Centralization furthermore has the effect that procurement does not lie within the responsibility of the user unit alone. The involvement of the central procurement unit as second player (and possibly of an independent lead buyer as third player) establishes a **many eyes safeguard** to procurement. This opens the opportunity for mutual checks, thus reducing the danger of bad handling or even corruption.

However, the involvement of several units also has the following **disadvantages**:

- The whole process is slowed down. Every involvement of a new person generates lying time. That is a time which elapses until a person carries out a task (e.g., answer a mail).
- The more persons are involved, the more coordination effort is necessary. This also slows the process down and increases process costs.

- A repartition of tasks within one process reduces the self-responsibility of the involved staff members. This can have a demotivation effect.

Formalization and standardization have positive consequences similar to those of specialization. They provide clear guidelines on how to act and thus reduce process costs and the probability of mistakes. They also facilitate control as to whether a certain process was carried out correctly. The disadvantage of formalization is that it makes it more difficult to find flexible and sensible solutions on a case to case basis when the necessity for it arises. Standardization can impede the creativity of staff members. These two negative effects can also lead to demotivation.

The tasks and needs of public administration tend to become more complex as do the products which the market offers as solutions. The same is true for public procurement law which is a key element of good governance. To achieve a due professional level, procurement within a contracting authority has to undergo a certain degree of centralization. Maturity level five provides the organizational frame for an approach that will balance out quality requirements of the user units and the necessity to spend taxpayer's money carefully. The advantages of centralization at that maturity grade will usually clearly outweigh the disadvantages. Taken seriously, procurement remains a complex and demanding task even after the repartition of tasks, thus presenting enough challenges for the involved personnel. The demotivation effect is therefore likely to be small to nonexistent. The repartition of tasks can even increase motivation if staff members feel overburdened and perceive the implication of others as help enabling them to concentrate on the tasks they feel qualified for. This may, for example, be the perception of user unit employees who might be happy to see the central procurement unit taking care of the complex tendering process with all its legal pitfalls.

Maturity level six and seven provide the framework for the pursuit of strategic goals going beyond delivering best value for money as prime objective of procurement. To provide for a central procurement unit at that level is indispensable if there is a political will to use procurement to promote further strategic goals. The weighing up of possible advantages beyond procurement with possible obstructions or disadvantages for procurement itself (e.g., higher prices, lower quality, enhanced danger of corruption) requires very good know-how and a strong voice capable of standing up to political will too often unfettered by technical expertise.

The lead buyer concept, widely used in procurement in the public and private sector, offers an excellent approach to make efficient use of already existing know-how and to increase acceptance in the user units for centralization and professionalization. Its implementation is therefore recommended. The market specialists working in the user units should be placed under the authority of the central procurement unit in procurement issues. This prevents them from being subject to particular interests within their user unit to the detriment of broader interests of the contracting authority as a whole.

As for formalization and standardization, the challenge is to find balanced solutions which will provide a sufficient level of procedural security and efficiency while leaving room for exceptions in special cases. There are enough examples of contracting authorities with well-organized procurement showing that such solutions are entirely possible.

## Conclusion

In times of public budget constraints and ever more complex challenges in public procurement, a relatively high degree of centralization and with it specialization, formalization, and standardization is necessary for professional procurement. This can encounter fierce opposition from within the administration, especially from user units. This opposition can only be tackled if the political leadership recognizes the necessity of a modern and professional organization as crucial condition for successful procurement.

## Definition

Theoretical fundamentals of organizations and their practical implications for contemporary governance: from Weber to New Public Management.

## Key Dominant Theories of Organization

Theories of organization contribute to "organization theory," an enormously challenging field of study that Waldo (1961) once called an "Elephantine" problem, one that depicts the impossibility to come up with a unifying framework that could offer a generalizable model of how humans form organizations and behave within them. The multiplicity of views on the subject has informed major theoretical streams that either complement each other or are diametrically opposed exposing each other's deficiencies. Broadly speaking, the theories of organization can be classified into mainstream and critical (Fischer and Sirianni 1984) or, as defined by Farazmand (2002), under the three categories of instrumental rationality (classical and neoclassical theories), systems theory and its off-springs, and critical and interpretive theories. These include, among others, classical (bureaucratic) theory, scientific management of organization, bounded rationality theory, systems theory, contingency theory, transaction-cost theory, institutionalism, chaos and transformation theories, as well as more multifaceted theoretical frameworks that account for power relations, politics, and control, for example, Marxist and neo-Marxist theories (Farazmand 2002, p. 20).

The mainstream theories of organization are based on the understanding that hierarchical structure, managerial control, efficiency, and work deskilling via work standardization (Farazmand 2002, p. 27) are the main features of modern organizations. It was Max Weber who in his classic description of the "ideal type" bureaucracy saw the dual-role relationship between the rational-logical model as the best form of organization of the modern state and the potential for oppressive and dehumanizing bureaucratic authority (Fischer and Sirianni 1984, p. 7). Furthermore, Frederick Taylor's scientific management work laid the ground for the rational model of organizations by praising internal efficiency maximization, work standardization, separation of managerial from operational functions, and maintenance of effective managerial control (Farazmand 2002, p. 26; Rainey 2014). Though widely accepted, this organizational model has also been criticized for its mechanistic approach to the division of labor and for the obsession with managerialism that disregards worker rights and promotes employee alienation. Similarly, within the administrative management school (Rainey 2014), Gulick and Urwick's POSDCORP model and, later on, Fayol's principles of management too emphasize the structural and functional rigidity of the efforts for organizational control and efficiency in a rapidly industrialized world (Farazmand 2002, p. 27).

Consequently, development of the theories of organization marks a distance from the purportedly purely rational, value-free models, by replacing the focus on efficiency and predictability with a more informal approach. Famously known as the Hawthorne studies, the research of Elton Mayo, Roethlisberger, and Dickinson inserted the employee morale and motivation variable into the productivity equation (calling it human relations theory) (Farazmand 2002, p. 28) to illustrate the influence of social and phychological factors on work behavior (Rainey 2014, p. 27). Furthermore, as an antithesis of the administrative school, Herbert Simon developed his "bounded rationality" concept (within the "behavioral theory" construct) – a realistic understanding of the constraints imposed by time, insufficient information, and resources on managerial ability. Furthermore, it was Dwight Waldo (1948) who attacked the politics – administration dichotomy exposing the so-called scientificity of scientific management that is the epitome of "pure rationality" in modern organizations (Farazmand 2002).

Systems theory, on the other hand, draws on the notion of employing a common communicative tool to study various types of systems based on their shared characteristics. Depending on their dynamic input-output nature, systems (organizations) are either open and adaptive or closed and insulated from their environment (Rainey 2014). The process typically involves a mobilization of a system's internal subsystems (social structure or technology) to neutralize external forces that aim at destroying its internal equilibrium (Farazmand 2002, pp. 30–31). Similarly, contingency theory accepts that environmental contingencies are the determinants of how effective and adaptable an organization will be in the face of external uncertainties. On the other hand, population-ecology theory, closely related to systems theory, emphasizes organizational "fit" as a readiness to face environmental changes (Farazmand 2002).

Institutional theory (also associated with systems theory) pays attention to various questions of the organizational field pertaining to structure, process, and values as key properties of institutions (Farazmand 2002, p. 73). Theorists of classical institutionalism, such as Herbert Simon, accentuate on functionalism, stability, efficiency, instrumental, and bounded rationality as characteristics of organizations' institutionalization that reinforce power relations within systems.

Furthermore, conceptually opposed to earlier theories of organization that promote bureaucratic hierarchy, "market" theory in its many faces (e.g., transaction-cost theory, public choice theory, agency theory) is based on the premise that rational individuals pursue their self-interest in the market environment through bargaining, exchange, and cost-minimizing – benefit-maximizing strategies (Farazmand 2002, p. 34). Inherent to the private sector in purported free-market conditions, corporate capitalism's dominant market theory today has taken over the domain of public administration and organization theories promoting individualism, personal utility-maximizing, and rationality above all, prompting an increasing number of critics to point out the fundamental flaws of market theory and corporate capitalism and noting the monumental negative consequences for average and working class people worldwide.

Critical and interpretive theories, on the other hand, diverge from the mainstream organization theories in their rejection of instrumental rationality as a tool for social domination (Farazmand 2002, p. 48). The emphasis, instead, is on the individual who takes center stage in redefining his/her role in the organization. This critical, interrogating stance toward reality (and society more specifically) reflects the complexity of organizations as an arena of human interactions and the role of the individual who is making sense of it all in the quest for emancipation and freedom.

In addition, there is a slew of emerging theories of the organization gaining traction in the realities of a globalized world that deserve a mention. Garbage can theory, on the one hand, is a metaphor for organizations viewed as garbage cans in which "problems are tossed" and interchangeably become solutions looking for issues to deal with (Farazmand 2002, p. 64). Natural selection theory, on the other hand, is an offspring of the garbage

can model and builds on Simon's bounded rationality, but rejects causality and embraces the process of sense-making as a tool of the interpretive theories (Farazmand 2002, p. 66); it also calls for survival of the fittest, and selection-in and selection-out in a highly uncertain world. Both theories, however, tend to oversimplify organizational relationships and what motivates people within their structures.

Furthermore, within chaos theory, organizations (viewed as open and dynamic systems with the potential to reinvent themselves through reproductive processes) build on nonequilibrium and instability to transform into a qualitatively new state (Farazmand 2002, pp. 86–87). Next, organizational elite theory rooted firmly in bureaucratically structured organizations delineates the perfect environment that gives elites political power tools (Farazmand 2002, p. 105). Public organizations then are controlled by select elites whose decisions (or nondecisions) serve a particular political agenda which has implications for the legitimacy of the administrative state.

## Bureaucracy – Essence and Function

The Weberian (ideal) type of bureaucracy as a definition is well-known and considered almost axiomatic. As Farazmand (2010) posits, bureaucracy designates a large organizational or institutional formation with clearly defined structure, process, normative values, rules, and regulations in a mix of merit and patronage framework (p. 256). In other words, bureaucracy denotes the "machinery of government" (both military and civilian), designed to effectively run the state through its legislative, judicial, and executive branches (Farazmand 2010, p. 247). Interestingly, both Max Weber and Karl Marx recognized the nature of bureaucracy as conducive for "social and political domination" within a class society (Fischer and Sirianni 1984, p. 13). The governance paradigm it creates and perpetuates only reaffirms the dominant societal power structure, thus handing it a political role in society. The stakes for control over bureaucracy then are very high (Farazmand 2010; Fischer and Sirianni 1984).

In addition, Farazmand (2010) sees bureaucratic politics at the core of governance; as an instrument for accomplishing political goals it has a dual role – it is either a governance tool of the elite or a systems maintenance instrument, or both (Farazmand 2010, p. 249). The "strengthening public bureaucracy" (Farazmand 2010, p. 256) involves social, policy, and attitude representation (e.g., social groups inclusion, legislating on behalf of minorities, desegregation, and equal pay, among others). In their position as an intermediary between the state and the public, bureaucrats inevitably assume a role in democratic governance through channeling first-hand information into the process of policy-making. Citizens' daily interactions with street-level bureaucracy serve as important evidence of the trust (or distrust) in the public sector and as a corrective to the bureaucrats' authority (Peters 2010, p. 216), as well as to the politicians' personal greed or ideological abuse of power (Farazmand 2010).

When discussing government in abstract terms, we all admit that the rules of authority that define the power of the bureaucrat often intersect with a self-imposed short-sightedness, courtesy of its hierarchical structure. In real-life situations, however (e.g., a state of national emergency), when resources need to be mobilized, the ability of bureaucratic structures to provide technical expertise becomes the epitome of timely government response and leadership with the potential to gain back citizens trust – yet, it is often the politicians that may be blamed for policy inaction that defies prompt and timely response. As professionals, bureaucrats know what to do, but they must conform to the demands of political authorities and in the manner they dictate them to do. The gaps emerge when those two often conflict – "politicians' aspirational wishes versus bureaucrats' expertise and professionalism" (Farazmand 1997, 2009).

## Public Management in a Time of Major Transformations

Rainey (2014) insists that public management need not be bashed as noneffective and nonperforming;

in fact, many public managers perform better than commonly acknowledged. To illustrate that, he outlines the distinctive characteristics of public management and organizations accounting for environmental factors (i.e., absence of economic markets, formal legal constraints), organization-environment transactions (e.g., public goods production), and organizational roles, structures, and processes (e.g., goal ambiguity, hierarchical structure) (Rainey 2014, p. 80). In such a setting, the functional analogies and complex interrelations between government, business, and nonprofit organizations (Rainey 2014, p. 60) give some scholars the reason to believe that this is the path to better efficiency in public management.

A side effect of the prevailing structures of market-oriented bureaucracy through privatization and contracting out is the weakening of the functions of representative institutions and the distortion of the notion of democracy as we know it. As Guy Peters defines it, it is a democracy in which accountability shifts from input (policy choices) to output (evaluation of the public sector performance) (Peters 2010, p. 218). Aptly called output democracy, this phenomenon reflects the fixation on performance measurement (a core feature of the New Public Management) and engages in measuring the outputs of democracy, for example, citizen (or rather customer) satisfaction with services. Even though this is viewed as a form of public participation, albeit somewhat passive (Peters 2010, p. 218), equity considerations emerge since service delivery via contract personnel may diminish the capacity for feedback and control. In addition, with the phenomenon of regulatory capture, accountability suffers and plutocracy is encouraged (Peters 2010, p. 220; Farazmand 2010, p. 254).

The environment in which policy subsystems, iron triangles, and advocacy coalitions interact with government brings us collaborative public management (Rainey 2014, p. 142). Closely related to the New Public Management (NPM) in the United States, it worships the practices of privatization, contracting out and outsourcing that have made ways in public organizations reconfirming the premise that in a globalized, interconnected world private sector practices are superior. In this "blurring of the sectors" (Rainey 2014, p. 57), private-public partnerships have become the norm marking the interweaving of the functions of public, nonprofit, and business organizations; the argument being that they are not that different after all. An appropriate example of such a symbiosis would be the newly announced private-public partnerships touted as the most adequate response to the emergency COVID-19 situation in the United States. In one of the first updates on the Coronavirus at the White House Briefings, one of the doctors in the WH Task Force made an interesting statement noting that the main achievement of the moment was the overcoming of internal bureaucracy at the CDC and the FDA (both government agencies) to ensure a quick response. Further on, the measures to combat the pandemic were declared a collaborative public-private partnership that would work to ensure that disaster responsiveness would be at par (e.g., sufficient consumer supplies, medications). How this will play out and if it will follow the recent path of "too big to fail" in which corporate and political elites were bailed out in a similar, not-so-distant situation at the expense of citizen taxpayers is yet to be seen. However, there is always the possibility that this may well be the last trial of the effectiveness of the new public management model. In the alternative, the collaborative effort might just save lives.

# Organizational Boundary Spanning

Steven Curnin
Tasmanian Institute of Law Enforcement Studies (TILES), University of Tasmania, Hobart, Australia

## Synonyms

Bridging organizations; Organizational brokers; Organizational gatekeepers

## Definition

Boundary spanning occurs at the periphery of organizations where the outer membrane allows for permeability for organizational actors to look out and others to look in. This can facilitate coordinated activity where new structures are forged to enable the sharing of resources and joint decision-making (Williams 2012).

## Introduction

The complexities and interconnectedness of modern society necessitate that entities involved in public administration cooperate and share information beyond their own organizations. Depending upon the number of organizations involved, this often results in the formation of supraorganizations that are the large-scale collaboration of multiple organizations to achieve a common outcome (Pasquero 1991). Supraorganizations require individual organizations to foster linkages to bridge the numerous boundaries that they may encounter. These boundaries often include numerous sociocultural and socio-technical complexities. This includes but is not limited to the different administrative and technological elements among organizations that can hinder communication and the subsequent flow of information. In addition are the potentially conflicting cultural boundaries unique to each particular type of organization. Lastly, and depending upon the extent of the business, are the geographical and jurisdictional boundaries that may also be encountered. To understand the intricacies involved with spanning organizational boundaries, it is important to provide some context around the evolution of this concept.

## Origins

Literature from the open systems theory explored the notion of organizational boundary spanning as early as the 1960s. Scholars initially characterized the spanning of organizational boundaries as a time when a person from one organization is located in a different organizational system (Khan et al. 1964). It was posited that as an organization constantly interacts with its external environment there is a need for individuals to provide contact between their organization and external organizations (Katz and Khan 1966). These individuals that work at the boundaries of organizations act as mediators for their own organization (Thompson 1967). This initial view of

organizational boundary spanning from the open systems theory perspective led the way for empirical research and the development and classification of the activities undertaken by individuals tasked with spanning organizational boundaries.

## Boundary Spanners

Early empirical research sought to identify the activities affiliated to the individuals tasked with spanning organizational boundaries. Scholars throughout the 1970s and 1980s established a foundation of activities that boundary spanners adopted to fulfill this role. These activities included providing external representation, acting as a liaison, and the gathering, processing, and transmitting of information to and from other organizations. However, it is not until research is carried out by Ancona and Caldwell (1992) that the individual activities of boundary spanners are theorized. In their pivotal research investigating how individuals span organizational boundaries, they produced a typology of four boundary spanning activities. They characterized these four activities as: (1) ambassador, (2) task coordinator, (3) scout, and (4) guard. They posited that the ambassador activity relies on the boundary spanner to provide access to the power structure of the organization. In addition, they suggested that the activity of task coordinator identifies how the person provides access to the workflow structure, and this was aimed at managing horizontal dependence. The activity termed scout concerned the acquisition of pertinent ideas and information. The final activity designated as guard related to actions that were aimed at avoiding the release of information to external parties (Ancona and Caldwell 1992).

Elements of Ancona and Caldwell's (1992) typology of four boundary spanning activities are evident in numerous examples of research conducted over the last two decades that investigate how workers span organizational boundaries in a number of diverse working environments. One of the most seminal works to date that comprehensively describes boundary spanning activities is by Williams (2012). His book is the culmination of over a decade of research exploring the role of boundary spanners in collaborative working practices, predominantly in the public sector. He presented a typology of four boundary spanning activities: (1) reticulist, (2) interpreter/communicator, (3) coordinator, and (4) entrepreneur (Williams 2012). Regardless of which boundary spanning activities are utilized, what is certain is that public administration in the twenty-first century is a complex, dynamic and operates in an often-uncertain world. Consequently, this necessitates that boundary spanners are able to address the multitude of challenges that can be encountered when fostering linkages between often disparate organizations.

## Boundary Challenges

Individuals tasked with spanning organizational boundaries in the realm of public administration can face multiple challenges. Public administration is often characterized by contrasting administrative and governance arrangements not only between departments but also amongst different government agencies. These administrative variations can sometimes foster silo mentalities that the boundary spanner may encounter. Spanning the administrative arrangements that are encountered at the boundaries of organizations is invariably amplified when public administrative agencies have to interact with nongovernment organizations. In addition, the interpretation of any legislative requirements that typically have different processes increases the task complexity of operating between organizations. Compounding these challenges can be communication obstacles.

The density of communications when spanning organizational boundaries, and especially when spanning multiple organizational boundaries, can prove challenging and lead to communication overload. Adding to these challenges are the associated technological barriers that are especially evident in information technology systems. A lack of information technology standardization between organizations often limits the boundary spanners ability to communicate across organizational boundaries in a timely manner. Compounding communication incompatibility

are privacy and security barriers that can hinder the transmission of any sensitive communications. Any communication challenges will ultimately impinge on the sharing of information.

Information exchange across the boundaries of organizations is a necessity to satisfy the specific information requirements of all parties involved. Pertinent and timely information is essential to enable boundary spanners to gain an accurate situational awareness. In the context of boundary spanning situational awareness refers to an individual's level of a situation, or understanding "what is going on" (Endsley 1995). A difficulty of working at the boundary of organizations is the differing information requirements of the parties involved. It is not always a requirement for all entities involved in boundary spanning activities to have the same situational awareness, fundamentally, they need to know what their organization needs to know. Nonetheless, the sharing of information across organizational boundaries is not only associated with communication challenges, but also by the cultural differences between organizations.

Different organizations can carry opposing cultural behaviors, expectations, assumptions, and beliefs that can prevent effective collaboration at the organizational boundary. Cultural barriers between organizations can be exacerbated by geographical boundaries. The geographical nature of organizational boundaries can impose physical constraints on those working in this domain as it may mean that the boundary spanner is potentially not physically supported by their own organization. Similarly, interjurisdictional collaborative approaches, nationally and internationally, may pose potential challenges as boundary spanners may also have to operate across virtual boundaries. Operating in this environment can intensify all the aforementioned constraints and therefore requires a unique set of mechanisms to address these challenges.

## Spanning Mechanisms

To address the myriad of constraints and successfully span organizational boundaries, individuals fulfilling a boundary spanning role must incorporate a number of activities (Curnin et al. 2015; Curnin and Owen 2014). Boundary spanners must be engagement champions and actively engage in forging organizational linkages with other organizations that they may interact with in the future. In addition, experience gained from previous interactions can assist with creating networks between organizations. Fostering relationships with stakeholders at the boundaries of other organizations can commence trust building between the parties involved.

Forging organizational linkages that lay the foundations for trust building assist in providing legitimacy for the boundary spanner. This is often difficult to attain within organizational boundaries, especially those that are hastily formed. Trust building can be challenging at organizational boundaries that invariably involves agencies from public and private sectors that differ socially and structurally. When forging alliances in these situations, it is of paramount importance that the incumbent provides clarity about their role. In temporary structures that require personnel to operate at the boundaries of organizations, there is invariably a requirement to "get things done" influenced by the ability to develop a shared understanding of evolving situations and the respective roles of the different stakeholders involved. This highlights the avoidance of personal disclosure strategies that are evident in traditional forms of trust building over a prolonged period of time, in favor of a reliance and absorption in the task driven by the generic features of the setting (Meyerson et al. 1996). The importance of rapid role clarification between personnel from different organizations is an imperative construct for facilitating communication and consequently information transfer.

Spanning organizational boundaries requires the boundary spanner to provide timely and relevant information across organizational boundaries so all parties involved can share and enhance their information requirements. Boundary spanners must be information experts and draw upon their skills to accurately collate, analyze, and disseminate information within their own organization and across boundaries to other organizations.

There is a requirement for all parties involved with interorganizational collaborative ventures to have situational awareness. However, it is not always a requirement for organizations to have the same situational awareness in the context of supraorganizations.

This is especially the case in complex and collaborative temporary supraorganizations when different organizations may have differing objectives. In these circumstances, boundary spanners seek to inform their and therefore their organizations situational awareness of the circumstances. This is the concept of distributed situational awareness where each organization's awareness is unique but complementary and thus each of the organizational representatives is instrumental in the development and maintenance of other organizations situational awareness (Salmon et al. 2008). This reinforces the requirement that boundary spanners thoroughly understand the domain they operate.

Organizational boundary spanning necessitates that the incumbent is a domain expert. They require an in depth knowledge of their own organizations intent and limitations as well as that of other organizations involved to inform their own organizations distributed situational awareness and that of other organizations. Furthermore, boundary spanners require knowledge and expertise of the specific information systems used in these domains to expedite the collation, analysis, and dissemination of information. Operating at the boundaries of organizations dictates that those performing this task take into account the temporal constraints and dynamism of the work domain that can require adaptability and flexibility with an ability to think laterally.

Individuals operating at the boundaries of temporary supraorganizations demand that the traditional means of organizing that are based upon routines can be nonexistent. Boundary spanners need to be lateral thinkers and require the ability to work under time pressures and address high risk, high consequence demands that are often present in these environments in an effort to ensure they receive the relevant information. However, the flow of information (in terms of quantity and quality) needed to provide continuous situational awareness could cause an increase on the amount of mental effort being used that can be problematic. Therefore, boundary spanners require the ability to "think outside the box" and access information from the most appropriate source. The challenges accompanying the requirements for collating quality information can also lead to information inconsistency resulting in conflict between stakeholders. Consequently, the boundary spanners require the skills of a conflict resolver.

The activity of conflict resolver can be facilitated with the activities of engagement champion and those of forging organizational alliances. Familiarity with other stakeholder's needs and requirements may assist in easing any conflicting situations. Boundary spanners must also have the ability to provide a rapid decision-making capability. An inability to provide a timely decision can result in tension between the parties involved resulting in conflict. Therefore, those personnel working at the boundaries of organizations also require the attributes of a legitimate enabler.

The activity of legitimate enabler entails the boundary spanner to have rapid access to a decision or the authority and empowerment to make a decision to commit to their organizations actions. Boundary spanners require an understanding of other organizations and their own organizations limitations and potential requirements so they can potentially preempt other organizations requests and give a rapid answer. Anticipating requests from other organizations and providing a rapid decision can assist in providing the boundary spanner with legitimacy. This can enable collaboration between all parties involved and can strengthen organizational alliances. Collectively these activities can address some of the sociocultural and sociotechnical complexities identified when working within supraorganizations.

## Conclusion

In the twenty-first century, the world in which public administration operates is complex and multifaceted. Organizations operating in this domain are expected to cooperate and share information

beyond their own organizations. This often requires the temporary or permanent formation of multiple organizations into supraorganizations. It is at the boundaries of these supraorganizations where organizations come together. The individuals that span these organizational boundaries are confronted by numerous sociocultural and socio-technical constraints. Subsequently, boundary spanners have to adopt a myriad of unique activities to succeed in this environment. The application of the aforementioned activities is pivotal to spanning organizational boundaries that can invariably determine the success of the supraorganizations that serve modern society.

# Organizational Burnout

Anna A. Filipova
Department of Public Administration, University of Wisconsin Oshkosh, Oshkosh, WI, USA

## Synonyms

Exhaustion; Feelings of ineffectiveness; Frustration or cynicism; Lack of enthusiasm and motivation; Reduced efficacy; Stress

## Definition

A syndrome of emotional exhaustion, depersonalization, and reduced personal accomplishment that can occur among individuals who work with people in some capacity (Maslach et al. 1996).

A state of exhaustion in which one is cynical about the value of one's occupation and doubtful of one's capacity to perform (Maslach et al. 1996).

Negative personal changes which occur over time in helping professionals working in demanding or frustrating jobs (Cherniss 1980).

## Introduction

The term "burnout" was first used in the United States in the 1970s and especially among people working in the human services organizations (Maslach et al. 2001). In the 1990s, empirical research on burnout was extended to occupations beyond the human services and education (e.g., health care, social work, police, government); different burnout measures were developed, and a more sophisticated methodology and analytic tools were used (Schaufeli et al. 2009). Currently, burnout is a

well-established academic subject; it is a phenomenon of global significance (Schaufeli et al. 2009).

As a metaphor for the draining of energy, burnout refers to "the smothering of a fire or the extinguishing of a candle" (Schaufeli et al. 2009, p. 205). The metaphor describes the exhaustion of employees' capacity to maintain an intense involvement that has a meaningful impact at work. As public servants deal with more complex demand-resources situations and navigate through complex, contradictory, and demanding institutional environments or fail to experience true organizational support and commitment to their well-being, they are more vulnerable to the exhaustion, cynicism, and inefficacy that define burnout (Schaufeli et al. 2009). In the field of public administration, theoretical and applied research on burnout has focused on examining the contribution of many potential influences and consequences of burnout in diverse public and nonprofit sector occupations in the United States and globally.

## Theoretical Perspectives

Maslach and her colleagues conceptualized job burnout as a psychological syndrome in response to chronic interpersonal stressors on the job (Maslach et al. 2001). The three key dimensions of job burnout were an emotional exhaustion, feelings of cynicism or depersonalization, and a sense of reduced efficacy or reduced personal accomplishment. The *emotional exhaustion* refers to feelings of being depleted of one's emotional and physical resources (Maslach and Jackson 1981; Maslach et al. 2001). The *cynicism or depersonalization* component refers to treating others impersonally, callously, and as objects (Maslach et al. 2001). The component of *reduced efficacy or reduced personal accomplishment* refers to the tendency to evaluate oneself negatively, particularly, with regard to one's work with clients or having feelings of incompetence and a lack of achievement and productivity at work (Maslach and Jackson 1981; Maslach et al. 2001). In general, the research on burnout has established the sequential link from exhaustion to cynicism and has supported a simultaneous development of the third dimension of inefficacy rather than a sequential one (Maslach et al. 2001).

To date, the Maslach Burnout Inventory (MBI; Maslach and Jackson 1986; Maslach et al. 1996) is almost universally used as the instrument to assess burnout. The original MBI included three subscales that measured the three dimensions of burnout. Items represented statements of personal feelings or attitudes, and each statement was measured according to both frequency and intensity (Maslach and Jackson 1981). Once the three burnout dimensions have been identified, conceptual models have been developed along the three-dimensional terms.

### The Phase Model of Burnout

The phase model (Golembiewski and Munzenrider 1988, 1990; Golembiewski et al. 1998) proposes that the three dimensions of burnout are progressively virulent. Emotional exhaustion is considered the most important contributor to burnout, followed by personal accomplishment and depersonalization, respectively. One of the unique features of the phase model is how an individual processes or experiences a stressor regardless of its frequency or intensity (Golembiewski et al. 1998).

According to Golembiewski et al. (1998, p. 60), the operational definition of burnout is built on responses to MBI items, which ask respondents: "How are things at work, relative to your comfortable coping attitudes and skills?" Each individual can be placed into one of eight phases of burnout from I (least advanced) to VIII (most advanced). Individuals in Phase I have the following characteristics: "they deal with individuals as sentient, valuing beings; they see themselves as doing well on jobs that are socially worthwhile; and they have a surplus or "slack" of emotional resources for coping with more stressors than they are experiencing." In contrast, Phase VIII individuals "...keep themselves distant from people, and hence can lack information as well as social support, also their work is not rewarding psychologically...report doing poorly on jobs that they consider largely unattractive, if not socially unredemptive...are in a deficit condition for mobilizing emotional resources to deal with new stressors." Individuals

in any of the eight phases can adopt one of two modes of coping: (a) "actives" – those that continue to confront their environment, and even contest it, and (b) "passive" – those who adopt a submissive posture toward the environment (Golembiewski et al. 1996, p. 98).

The phase model also suggests that an individual does not have to go through each of the phases to reach Phase VIII. Rather, the model builds on a common medical distinction and allows for two types of progression to advanced burnout, namely, chronic burnout (a path through Phases I to II to IV to VIII) and acute burnout (a path through the Phases I to V, II to VI, III to VIII, or IV to VIII) (Golembiewski et al. 1998). There is substantial evidence to support the operational definition of the phase model and its concurrent validity, as well as the frequently consistent covariance of the phases (e.g., Golembiewski and Munzenrider 1990; Golembiewski et al. 1992, 1996).

### The Job Demands-Resources (JD-R) Model

The job demands-resources (JD-R) model has been used in empirical studies to explain the effects of job demands and resources on burnout development and is considered to be parsimonious, flexible, and robust (Demerouti et al. 2001; Bakker and Demerouti 2007). It assumes that burnout develops irrespective of the type of occupation "when job demands are high and when job resources are limited because such negative working conditions lead to energy depletion and undermine employees' motivation, respectively" (Demerouti et al. 2001, p. 499). Job demands include "any physical, social, psychological or organizational requirements of the job that call for sustained psychological and/or physical effort or skills" (Demerouti and Bakker 2011, p. 2). Resources include "the physical, social, organizational or psychological aspects of the job that meet one of the following criteria: a) serve a functional role in meeting work goals, b) reduce the physiological and/or psychological costs of demands, and/or c) promote personal growth and development" (Demerouti and Bakker 2011, p. 2).

This model proposes that the development of burnout follows two processes (Demerouti et al. 2001). In the first process, when job demands are high, employees experience increased exhaustion (but not disengagement). In the second process, a lack of resources complicates the meeting of job demands, which further leads to high levels of disengagement (but not exhaustion). In jobs with both high job demands and, at the same time, limited job resources, employees develop both exhaustion *and* disengagement, a state also known as the *burnout syndrome* (Demerouti et al. 2001). Exhaustion and disengagement are correlated, but not causally related to each other, and exhaustion may develop faster than disengagement because individuals seem sensitive to job demands (Demerouti et al. 2001).

The Oldenburg Burnout Inventory (OLBI) was constructed to measure burnout and was validated among different occupational groups (Demerouti et al. 2001). The OLBI includes two dimensions: *exhaustion* and *disengagement from work*. Contrary to exhaustion as operationalized in the original MBI, the OLBI covers not only affective but also physical and cognitive aspects of exhaustion; furthermore, burnout represents a dichotomous and not a continuous trait (Demerouti et al. 2001). The validity of the JD-R model was consistently supported by research (Demerouti et al. 2001; Bakker and Demerouti 2007).

### Process Model of Burnout

Cherniss's (1980) model proposes that particular work-setting characteristics interact with individuals who enter the job with particular career orientations. These individuals also bring with them particular extra-work demands and supports. These factors, in concert, result in particular sources of stress being experienced to varying degrees by employees. Individuals cope with these stresses by employing strategies that might be termed active problem-solving or by exhibiting the negative attitude changes – that is, burnout. The process model was not tested empirically because the coping/active problem-solving variables were not specified well by Cherniss to permit the development of measures (Burke and Greenglass 1995).

Burke and Greenglass (see 1995, p. 1358) proposed a modified version of the Cherniss model in samples of police officers and school-based

educators. The model proposes that burnout consists of negative attitude changes, such as reduced work goals, less personal responsibility for work outcomes, less idealism/realism, greater emotional detachment, work alienation, and heightened self-interest. The development of these negative attitude changes represents a form of coping or the result of inadequate coping via active problem-solving. Three sets of variables are hypothesized to influence burnout: 1) work setting (e.g., workload, autonomy, institutional goals, leadership), 2) the individual (e.g., demographic characteristics, career orientations, extra-work supports and demands), and 3) sources of stress (e.g., doubts about competence, problems with clients, bureaucratic interference, lack of stimulation, lack of collegiality). The work setting and the individual factors have both direct and indirect effects on burnout, whereas the sources of stress have a direct effect (Burke and Greenglass 1995).

## Outcomes of Burnout in Public Agencies

### Burnout and Job Withdrawal

Because the three dimensions of burnout occur in the context of emotional or psychical exhaustion and affect all employees' perceptions of their jobs, burnout might reduce individuals' intention to remain in their organizations. Empirical studies (e.g., Jackson and Maslach 1982; Jackson et al. 1986) have shown that frontline public employees, like police officers and teachers, tend to leave their organizations under conditions of high levels of emotional exhaustion. Also, depersonalization in worker interactions has occurred easily in the public sector because rule-based procedures are prioritized over interactive relationships (Kim 2015). For example, Goodman and Boss (2002) found that as the phases of burnout progressed, an individual might be more likely to leave voluntarily an organization due to an inability to cope with the increasing strain. Kim (2015) found that the degree of emotional exhaustion and depersonalization could significantly influence the relations among intrinsic motivation, self-sacrifice, and turnover intention and that motivating public employees intrinsically could be a strategy to reduce burnout and turnover intention in local governments.

Factors such as mission change, employee burnout, and staffing levels can explain desires to transfer jobs. Ihrke (2004) found that radical mission change significantly influenced the desire of district conservationists (DCs) to transfer jobs within the agency of Natural Resource Conservation Service of the US Department of Agriculture. In addition, DCs experiencing burnout were more likely to attribute their desire to transfer to a non-DC job to the negative aspects of the conservation title of the Food Security Act of 1985 than DCs who were not experiencing burnout (Ihrke 2004, p. 182). To reduce job transfers, the agency should provide training in regulatory enforcement to make current DCs and new hires more comfortable with their new role as well as modify the list of skills required of new hires (Ihrke 2004).

### Burnout and Job Satisfaction, Commitment, Productivity, and Performance

Burnout may lead to decreased job satisfaction and a reduced commitment to the job or the organization as well as result in lower productivity and performance (Maslach et al. 2001; Schaufeli 2003; Golembiewski et al. 1996; Golembiewski and Munzenrider 1990). For example, Wang et al. (2014) found that the relationship between police officers' stress and job satisfaction was mediated by job burnout. The police officers with higher job stress took a dehumanizing and impersonal view of others and felt dissatisfied with the job. Locus of control acted as a moderator in the stress-burnout relationship as well as in the burnout-satisfaction relationship (Wang et al. 2014). National and global research also indicates that advanced phases of burnout (Phases VI-VIII) were associated with decreased job satisfaction and poor performance and productivity (Golembiewski et al. 1996, 1998).

### Burnout and Health

Consistently, research also associates progressive phases of burnout with deteriorating mental health (Golembiewski et al. 1992, 1996). For example, Golembiewski et al. (1996) found that as the

burnout phases progressed, mental health symptoms increased in global and North American work settings. Golembiewski et al. (1992) found a significant deterioration of health for the advanced phases of burnout in two local police departments. Individuals at advanced phases of burnout were far more likely to manifest various awkward behaviors and attitudes directed against self, their organizations, or client. This study showed the need for prompt diagnosis of burnout at work settings as well as early prevention and amelioration of advanced burnout by management (Golembiewski et al. 1992).

## Antecedents of Burnout in Public Agencies

### Job Characteristics and Burnout

Experienced workload and time pressure were strongly and consistently related to burnout, particularly the exhaustion dimension (Maslach et al. 2001). Further, research has found that both role conflict and role ambiguity had a moderate to high correlation with burnout (Maslach et al. 2001). For example, Green, Albanese, Shapiro, and Aarons (2014) found that decreasing levels of role conflict and overload, increasing role clarity and cooperation, and the presence of a transformational leader appeared to prevent burnout in publicly funded mental health service providers. Results supported the use of organizational development (OD) interventions aimed at creating more functional working climates and developing transformational leadership styles.

In addition to studying the presence of job demands, burnout researchers have also investigated the absence of job resources. A lack of feedback and little participation in decision making had also been associated with all three dimensions of burnout (Hock 1988; Maslach et al. 2001). There had also been strong evidence that a lack of social support (e.g., supervisors, coworkers) was linked to burnout (Burke 1987; Maslach et al. 2001). For example, Russell, Altmaier, and Velzen (1987) found that public school teachers who reported that they had supportive supervisors and received positive feedback concerning their skills and abilities from others were less vulnerable to burnout. Lizano and Barak (2015) found that when the moderating effect of supervisory support was taken into account, role conflict and ambiguity did not predict burnout among urban public child welfare workers. Hsieh (2014) established that only coworker support could diminish the deleterious effect of negative display rules (i.e., policies and procedures that "request suppression of negative emotions," p. 382) and that job control and rewards only had limited effect on lessening the undesired impact of negative display rules on emotional exhaustion among public service workers. Several strategies to deal with burnout were proposed: "(a) allowing workers to decide for themselves how to respond to the demand, (b) encouraging and facilitating mutual support between coworkers, and (c) recognizing and praising for a job well done by providing rewards" (Hsieh 2014, p. 396).

### Organizational Characteristics and Burnout

Researchers postulated that organizational factors were major contributors to job burnout (Maslach and Jackson 1981; Cherniss 1980). The focus was on the organizational and management environment in which work occurs. Research suggests that investing in developing supervisor transformational leadership and mentoring relationships could reduce employee emotional exhaustion and turnover. For example, Green et al. (2013) established that transformational leadership moderated the relationship between emotional exhaustion and turnover intention among public sector mental health-care providers. Similarly, Webster and Hackett (1999) found that clinical supervisors' leadership was important for the development of a positive work climate and for reducing employees' emotional exhaustion and depersonalization in community mental health agencies.

Research has also highlighted the importance of the values implicit in organizational processes and structures and how these values shape the emotional and cognitive relationship that people develop with their work (Maslach et al. 2001). For example, Hsieh (2014) found that to the extent to

which personal values were in line with organizational goals, positive display rules (i.e., rules that request expression of positive emotions) had no effect on emotional exhaustion. Moreover, when a job demand was well internalized as a norm, it was hardly perceived as a demand and caused no harm to employee well-being. Rather than telling workers what not to express on the job, organizations should implement interventions, such as employee assistance programs, that "help employees to cope with emotional labor requirements, maintain mental toughness, and deliver quality public service" (p. 397).

The organizational context is also shaped by larger social, cultural, political, technological, economic, and other forces. When organizations adopt specific strategies in response to the external environment pressures, organizational changes can have significant effects on the lives of the employees (Maslach et al. 2001). For example, Gabris and Ihrke (1996) found that district conservationists (DCs) at the National Resources Conservation Service experienced substantially higher burnout rates when compared to national norms. Having to implement an unpopular environmental legislation caused DCs to experience job-related stress and burnout. Also, perceptions of low leader credibility and change motivation, at all levels within the agency, were related to higher levels of job burnout among the DCs. On the other hand, the DCs who felt their general work provided task variety, identity, and importance experienced lower MBI scores. The authors suggest the implementation of OD interventions that focus on strengthening processes of planned change and developing leaders' credibility.

### Individual Characteristics and Burnout

People do not simply respond to the work setting; rather, they bring unique qualities to the relationship. These personal factors include (a) demographic variables, (b) enduring personality characteristics, and (c) work-related attitudes. Several of these individual characteristics have been found to be related to burnout (Maslach et al. 2001). For example, Russell et al. (1987) found that teacher characteristics, such as age, sex, and grade level taught, were predictive of burnout. In contrast, other researchers found no or limited differences in susceptibility to burnout due to demographic characteristics among teachers (Hock 1988) and mental health providers (Green et al. 2014). Burke (1987) found that police officers' job and work-setting characteristics played a primary role compared to demographic factors. In sum, "burnout is more of a social phenomenon than an individual one" (Maslach et al. 2001, p. 409).

Guy and Lee (2015) examined how emotional intelligence mediates emotional labor in the performance of work duties by using job satisfaction and burnout as criterion variables among adults who worked full time in public service organizations (federal, state, city, county, or nonprofit agencies) or were enrolled as part-time students in graduate public administration courses. Findings showed that emotional labor was positively and directly related to job satisfaction unless it was mediated by higher levels of emotional other-awareness. Emotional labor significantly increased burnout unless it was mediated by emotional self-regulation. The findings suggest that training to enhance workers' ability to regulate their own emotions will lead to reduced burnout, lessened turnover, absenteeism, or performance problems.

Ihrke (1999) examined the relationship between federal employee attitudes toward regulatory enforcement and psychological burnout. The results revealed significantly different attitudes toward enforcement of environmental laws that were found to be significantly related to experienced psychological burnout. In the highest phases of burnout, passive supporters tended to experience emotions such as depression, while active supporters in the higher phases tended to experience frustration and/or distress. At the lower burnout levels, active supporters tended to be excited about their work, and passive ones tend to be content. In sum, active supporters were more likely to experience "better" effects than passive ones; they were also more likely to perceive leaders as credible and also reported higher levels of job satisfaction.

## Burnout as a Global Phenomena

Two types of cross-cultural research on burnout could be identified. First is psychometric research that tested the equivalence of MBI across different countries and cultures; this research had confirmed the positive psychometric properties of the MBI measure (Schaufeli 2003; Schaufeli and Janczur 1994). This research has also shown that despite the similarities in psychometric properties of the MBI, there were national differences in the average levels of burnout (Schaufeli and Janczur 1994). Second is descriptive research that studied and confirmed the relationship of burnout with a similar set of other variables across countries (Schaufeli 2003). For example, Golembiewski et al. (1996) summarized data on incidence of phases in 62 North American work settings. "Only 4 of the 62 organizations have fewer than 20% of their respondents assigned to Phases VI through VIII. Relatedly, 47 of the 62 organizations have between 30% and 60% of their responding employees assigned to the three most-advanced phases, and these cases contain over 92% of all assignments to Phases VI through VIII" (p. 164). In comparison to the North American settings, where "41% of respondents were assigned to each of the two clusters of the three most-and least-advanced phases of burnout," data on the incidence of phases in 21 global work settings shows that "54.7% of its respondents were in the three most advanced phases, and 26.3% in Phases I-III" (p. 171). The highest incidence of burnout was found in Japan (69%) and Korea (44%) (p. 170). Golembiewski et al. (1996, p. 106) also found that as burnout phases progressed, the proportions of "passives" compared to "actives" increased. The authors (1996, p. 236) conclude that burnout seems to be "generic" and "culture specific," which means that the phase model is supported across nations, but nevertheless some cross-organizational, cross-national, and cross-cultural differences may exist.

In a different study, Golembiewski et al. (1998) summarized public-sector findings in 34 work settings – in the United States, Canada, and worldwide. The findings showed that first, a large number of variables covaried with the phases in regular and robust ways. Second, the incidences of advanced phases also varied in numerous populations, but burnout appeared high almost everywhere. Third, North American public-sector employees experienced levels of burnout similar to those experienced by employees in the private sector. The phases each implied appropriate ameliorative interventions. For example, Phase II assignees would benefit from interventions that improve interaction, whereas those in Phase III would benefit from various approaches on task improvement. For Phase IV and beyond, OD strategies relating to structure, policies and procedures, and interaction could be recommended and used.

## Criticism of Burnout Research

There have been many theoretical explanations of burnout over time that included mainly individual, interpersonal, and organizational approaches, of which only few have received empirical support (Schaufeli 2003; Maslach et al. 2001). "The approaches were most successful in uncovering the underlying psychological processes that cause and maintain burnout" (Schaufeli 2003, p. 9). Further, the significance of burnout, both for the individual and the workplace, lies in its links to important outcomes. However, the research findings have to be interpreted with some caution because of the reliance on self-report measures (rather than other indices of performance or health) and the relative absence of methodological designs that permit causal inferences (Golembiewski et al. 1996; Maslach et al. 2001; Schaufeli 2003). Third, although burnout has been studied around the globe, because of the variation in sample selection, strong conclusions about national differences and the underlying reasons for them are difficult to ascertain (Golembiewski et al. 1996). Finally, the applied nature of burnout research has prompted calls for effective remedial and preventative interventions that deal with structures, policies and procedures, and interaction (Golembiewski et al. 1996,

p. 248). Learning designs that can help with burnout have been developed in the related fields of OD and quality of working life (Golembiewski et al. 1996). However, there have been little attention and systematic research directed at ameliorating burnout (Golembiewski et al. 1996).

## Conclusion

According to Schaufeli (2003, p. 12), "a grand unifying theory of burnout will always remain a dream, simply because the phenomenon is too complex and multi-faceted." Nevertheless, studies conducted in public agencies have provided evidence for the hypotheses put forward by the diverse theories and models of burnout. Moreover, the "persistence and incidence of the phases" of burnout provide a strong theoretical and practical reason for accelerating burnout research (Golembiewski et al. 1996, p. 258). Burnout as a psychological phenomenon will be taken seriously by the management of public organizations when they understand how burnout affects organizational outcomes, such as job performance. That is, organizations will be inclined to invest in preventive, organizational-based anti-burnout programs when they believe positive results can be obtained from such interventions (Schaufeli 2003). This calls for collaborative research between economists and applied public administration scholars to investigate the cost-effectiveness of intervention programs.

# Organizational Cheating

Gary Mays
Illinois State University, Normal, IL, USA

## Synonyms

Corruption; Entitlements; Fraud; Goal displacement

## Definition

Goal displacement: occurs when resources – tax dollars and other finite resources – are redirected for use in a manner that is not entirely consistent, or wholly inconsistent, with the organization's mission.

Whistleblower: a person who reports cheating in an organization.

## Introduction

Cheating is an unfortunately common human behavior prevalent in government organizations and programs, which are comprised and administered by individual actors and subgroups. Around the world, cheating typically impacts the poorest or less fortunate in society the most, with many contending that it is both a major source of poverty and a cause of it. It occurs at all levels of society and within many branches of government and across the private sector.

Many types of government and organizational cheating have at their heart what social scientists and experts call goal displacement. Goal displacement happens when resources – tax dollars and other finite resources – are redirected for use in a manner that is not entirely consistent, or wholly inconsistent, with the organization's mission. Other forms of cheating are done to appear to maximize organizational outputs for preferential consideration in budgeting and policy decisions.

## Definitions of Cheating

One study defined organizational cheating as any deliberate activity by employees or actors in an organization that violates core organizational and societal norms. This theory is consistent with the theory of goal displacement outlined above. Still other researchers view organizational cheating as falling into three areas – cheating benefitting the self, misbehavior that benefits the organization, and finally, cheating that is intended to inflict damage on other people or organizations. Experts also point to intent when it comes to defining

misbehavior, arguing that for misbehavior to be considered cheating it must be "intentional" (Vardi and Wiener 1996).

Ultimately, people who work for government value honesty as much if not more than those working in the private sector. But they still face a number of reasons and pressures to cheat. Those pressures can emanate from higher ups, peers, and policy makers. Cheating also occurs across income strata. In fact, some experts and social scientists have observed that cheating is more common among those making more money and that such people can be more likely to cheat because the behavior is connected to their pay rate and evaluation of performance.

## Examples of Cheating

No organization or government is immune from cheating – from schools to military institutions to elected officials and legislative bodies and their committees. In the military category, officers in the US Air Force missile launch program held a pervasive belief that they had to get perfect test scores to be promoted. That prompted many of them to cheat. Several years ago, half of the nearly 200 launch officers at a Montana nuclear missile base were implicated in a cheating scandal and suspended from their posts, prompting air force officials to fear wide-ranging human resource issues within the country's nuclear-security apparatus.

The problems arose from an Associated Press probe of the US nuclear force that actually began with an initial drug investigation. In all, 92 officers were implicated, with nearly half directly involved and the remainder potentially aware of cheating but kept silent about it. The AP article blamed "a worrisome culture of fear" for the missile corps cheating scandal.

Cheating, mainly involving budgeting and expenditures has been rampant at the US Department of Defense. The *Encyclopedia of Ethical Failure*, published by the Pentagon General Counsel's Standards of Conduct Office, documents dozens of offenses. "The characters in most cases are anonymous, but the problems unearthed in the report focus on the Pentagon's irresponsible financial culture" (Francis 2014).

Among the scandals that plagued the Pentagon: a civilian worker for the US Navy allegedly took a $5,000 bribe to funnel a six-figure contract to a private company doing business with the military. Another DOD worker even labeled himself "the Godfather" for his ability to direct military deals to companies willing to pay him bribes to get the work.

The DOD's *Encyclopedia of Ethical Failure* concludes by warning future military decision-makers of the long jail sentences, fines, and firings of individuals found to have violated ethical standards and laws that pertain to contracting.

Cheating in publicly funded education has also made plenty of headlines in the United States in recent years, as school districts and individual educators strive to meet new standards and measurement criteria that have been introduced legislatively by "No Child Left Behind" and other sweeping policies designed to improve overall outcomes. That is especially true as teachers' paychecks and positions are placed in jeopardy if students do not perform well on a plethora of standardized tests that have been introduced into the classroom in recent years to boost accountability.

## Cheating as Fraud

The study of fraud and waste in government programs – especially when it comes to estimates of its size and scope – also cuts across ideological lines, with conservative lawmakers and thinkers typically asserting high levels of fraud and liberals insisting that fraud and waste are minimal. This is especially true when it comes to entitlement and government welfare programs at both the state and federal levels in the United States.

According to one study, for example, fraud accounts for less than 2% of unemployment insurance programs (Hanson 2015).

However, US Senator Ron Johnson, a Wisconsin Republican, has been quoted as saying that "whether it's the Earned Income Tax Credit or Medicare or Medicaid, across the board, food

stamps, the average rate of fraud in those programs is 20 to 25 percent . . ." The earned income tax credit provides federal tax credits for low to medium wage earners, potentially boosting the amount of tax refund such workers receive each year. Tax cheating is a bigger problem in general because, for the most part, it involves voluntary compliance among individuals and organizations. Tax cheats according to one estimate cost the US government "hundreds of billions" of dollars.

Fraud in entitlement programs such as Medicare and Medicaid is also commonly cited when it comes to cheating in government organizations. The FBI in one report estimated that the cost from Medicare and Medicaid fraud is as high as 3–10% of the amount of tax dollars spent on the programs, a percentage that totals nearly $200 billion. Meanwhile, fraudulent expenditures in the smaller-but-still-sizeable Supplemental Security Income (SSI) and Social Security Disability Insurance (SSDI) programs have been estimated to be in the 10% range of total expenditures. US food stamp (Or SNAP) benefits are another target of critics who cite waste and fraud in federal programs. Legislation was recently introduced to reduce waste and fraud in the Supplemental Nutrition Program by $30 billion. The program provides direct benefits to the poor and working poor through direct payment for food, although most states now distribute the benefits using debit-style cards instead of the old paper vouchers or stamps. Still, contrary to the popular stereotype, government error and supermarkets "trafficking" in food benefits were found to be the cause of much of food stamp fraud – not so-called welfare mothers taking advantage of a program for which they had no need (Schnurer 2013).

## The Science Behind Cheating

The science behind cheating is rooted in human behavior, most experts agree, noting that no one person or organization is immune from cheating. According to one study, most but not everyone cheats under certain circumstances (Bohte and Meier 2000).

> A common finding is that people don't cheat as much as they can get away with but rather, they cheat up until the point at which they continue to believe they are good people. . .thus when facing the opportunity to cheat people seem to experience a desire between their desire to maintain a positive self image by behaving honestly and their desire to advance their self image (e.g. get a financial benefit) by crossing ethical boundaries. (Bohte and Meier 2000)

Thus, the definition of cheating by some is changeable. Indeed, lab experiments reveal that people who witness their peers or others within their organization cheating are more likely to cheat themselves (Mazar et al. 2008).

Government can even be an attractive potential employer for students who are more likely to cheat after graduation, according to a study by Harvard University and the University of Pennsylvania. The results were released in the National Bureau of Government Research and describe when students in India were asked to keep track of the financial reward for rolling a die. With a financial incentive involved, the Indian students were more likely to falsely report higher numbers in the test and want government jobs (Cloud 2014).

## Remedies for Cheating in Government

How do policy makers curtail organizational cheating in government? For one thing, more can be done to educate government employees on the punishment for cheating – getting fired, sentenced to jail or probation and other measures. Indeed, many violations of government ethics can be considered criminal in nature (Francis 2014).

Students also need to be educated early and often on the dim prospects for getting away with cheating, especially when it comes to test taking and plagiarism, the latter a problem made more common in the technological era (Flanagan 2016).

In the United States, a primary tool for targeting cheating in government organizations is the False Claims Act, which protects so-called whistleblowers who inform government agencies or law enforcement of cheating.

Known as a Qui Tam Action in legal parlance, blowing the whistle on a government organization or individual essentially involves suing the government and requesting protection from retribution for the action (Kang Haggerty & Fetbroyt 2016).

An actual relic of the Civil War, the False Claims Act (31 U.S.C. §§ 3729–3733, also called the "Lincoln Law") is an American federal law that imposes criminal liability on individuals and corporations that defraud government. The act is now more than 150 years old, and was initially created to stop contractors from selling defective ammunition and goods to the Union Army.

Cheating in the United States also can be prosecuted under a number of other statutes, including those involving "Conspiracy to Defraud the United States" (923. 18 U.S.C. § 371). Case law related to the fraud aspect is blunt in its description of the crime, saying the intent of the law is to protect government from "frustration and distortion" by dishonest actors. In *Hammerschmidt v. United States*, 265 U.S. 182 (1924), violations of the statute were described thusly:

> To conspire to defraud the United States means primarily to cheat the Government out of property or money, but it also means to interfere with or obstruct one of its lawful governmental functions by deceit, craft or trickery, or at least by means that are dishonest. It is not necessary that the Government shall be subjected to property or pecuniary loss by the fraud, but only that its legitimate official action and purpose shall be defeated by misrepresentation, chicane or the overreaching of those charged with carrying out the governmental intention. (www.justice.gov)

## Conclusion

While such laws have been used successfully for decades, cheating in government organizations around the world continues to be a major problem, experts say, because of the latitude government employees and agencies have in carrying out their duties. There is a case to be made for not only stronger laws but tighter ethics globally.

> The discretionary power of public servants goes beyond manuals, orders, job descriptions and legal frameworks of their positions and duties, and professional ethics have to come in as guidelines in addition to formal regulations. There is, however, a perception that standards in public life are in decline, raising questions about the costs of misconduct on the part of those who have been entrusted with guarding the public interest and resources. (Moti 2013)

According to the Global Corruption Barometer, which gauges the impact worldwide of corruption on everyday people, the number of people paying bribes in exchange for basic government services in the Middle East and Africa is 50 million. But Europe is by no means immune to organizational cheating. One recent cheating scandal that made global headlines involved automaker, VW, which rigged turbo diesel engines to only kick on during emissions testing. That action uncovered by the US Environmental Protection Agency, resulted in the sale of cars that delivered up to 40 times more pollutants during actual driving test. Not only was the VW brand tarnished and the company facing billions in fines, to date it has cost about 30,000 people their jobs (Gallagher 2015; Chapman 2016).

# Organizational Citizenship Behavior

Juliana D. Lilly
Sam Houston State University, Huntsville, TX, USA

## Synonyms

Civic organizational behavior; Extra-role behavior; Organizational spontaneity; Prosocial behavior

## Definition

Organizational citizenship behavior (OCB) is employee work behavior that is positive and beneficial to an organization, but is not specifically required in the job description. Organizational citizenship behavior is discretionary behavior that is not directly or formally compensated by the organization's reward system. The behavior is truly extra-role behavior which, when performed by many individuals, improves the overall functioning of an organization. Examples of organizational citizenship behavior include volunteering for extra work, promoting the organization to outsiders, helping a coworker who is behind, or going out of the way to encourage or express appreciation to coworkers.

## Introduction

Organizational citizenship behavior is an outcome of the discussion on whether or not there is a link between job satisfaction and job performance. From the 1950s to the 1970s, researchers published conflicting opinions on this topic with some suggesting increased satisfaction led to increased performance and others suggesting increased satisfaction did not lead to increased performance. The conflicting results led researchers to more closely examine the definition of job performance. In the late 1970s and early 1980s, researchers began to elaborate on the definition of job performance to go beyond production metrics to include extra-role behaviors such as cooperation or helping coworkers who need support. In 1983, the term "citizenship behavior" was coined to describe positive, beneficial employee behaviors that were valued by supervisors but were not specifically required in the job description. Tests of the relationship between job satisfaction and the newly defined citizenship behaviors showed positive correlations on a fairly consistent basis, and researchers began to refine measures of these extra-role, prosocial behaviors (Organ 1988a).

## Dimensions of Organizational Citizenship Behavior

Scales developed in the 1980s to measure organizational citizenship behavior eventually progressed to the point of identifying five dimensions, or types, of organizational citizenship behavior to include altruism, conscientiousness, sportsmanship, courtesy, and civic virtue (Organ 1988b):

- Altruism refers to discretionary behavior that helps others within an organization with a task or problem, such as helping a new employee

find the appropriate forms to use or helping a coworker transport and set up marketing materials for a new lobby display.

- Conscientiousness refers to behavior that helps the organization, but differs from altruism in that altruism helps a specific person while conscientiousness is less personal. For example, a conscientious organizational citizenship behavior may entail finishing work at home waiting on an emergency home repair, while an altruistic organizational citizenship behavior may entail meeting a client for a coworker who cannot attend the meeting due to an emergency.
- Sportsmanship refers to behaviors such as not complaining or focusing on petty grievances. Even when the individual has a legitimate reason to complain, someone exhibiting sportsmanship organizational citizenship behavior would simply accept the situation and go forward, knowing that everything will work out in the long term.
- Courtesy refers to behavior such as giving advance notice, reminders, or keeping others informed of work situations. Courtesy differs from altruism in that altruism helps others after a problem has already occurred, while courtesy helps prevents a problem from occurring.
- Civic virtue refers to behavior that contributes to effective organizational governance by attending meetings, discussing issues relevant to the organization, and adding thoughtful input to the discussion.
- Two other dimensions of organizational citizenship behavior, peacekeeping and cheerleading, were added to Organ's (1988b) original five dimensions a few years later. Peacemaking refers to actions that prevent or resolve unconstructive conflict, and cheerleading refers to encouragement and reinforcement of coworkers' accomplishments (Organ 1990).

As research on organizational citizenship behavior continued to evolve, other types of organizational citizenship behavior were developed by combining some of the original dimensions into broader terms to identify the target of the behavior or by creating new terms that expanded or slightly varied definitions of the original dimensions. For example, organizational citizenship behavior identified in terms of the target of the behavior has two categories: OCBO and OCBI. Organizational citizenship behavior directed toward the organization (OCBO) contains elements of sportsmanship, conscientiousness, and civic virtue, while organizational citizenship behavior directed toward the individual (OCBI) contains elements of altruism and courtesy (Williams and Anderson 1991). Researchers have identified more than 40 measures of organizational citizenship behavior dimensions (LePine et al. 2002), but factor analysis results suggest seven common themes tend to emerge from these measures. These themes are listed below with sample studies supporting each theme:

1. Helping – includes altruism, courtesy, peacemaking, and cheerleading (Podsakoff and MacKenzie 1994)
2. Organizational compliance – internalizing the organization's rules and procedures even when no one is watching (Borman and Motowidlo 1993; Smith et al. 1983.
3. Sportsmanship (Organ 1988b; Podsakoff and MacKenzie 1994)
4. Civic virtue (Organ 1988b, 1990)
5. Organizational loyalty – promoting, protecting, supporting, and defending the organization (Graham 1991; Moorman and Blakely 1995)
6. Self-development – voluntary behavior to improve knowledge, skills, and abilities in the workplace (George and Jones 1997)
7. Individual initiative – engaging in task-related behaviors well beyond what is generally expected (Moorman and Blakely 1995; Organ et al. 2006.

## Measurement Issues of Organizational Citizenship Behavior

Researchers have measured organizational citizenship behavior using many different scales, something to be expected given the 40 identified dimensions mentioned above. Organizational citizenship behavior has also been measured differently based on the level of analysis, such as

individual-OCBI versus organizational-OCBO level (Williams and Anderson 1991), and based on whether the scale measures the frequency of organizational citizenship behavior or the extent to which the respondent agrees that a particular individual engages in organizational citizenship behavior (see Spector and Che 2014, for a discussion of agreement-response versus frequency-response scales). Due to the plethora of measurement scales, researchers began to examine the way organizational citizenship behavior is measured to see if the measurement method influences the statistical relationships between variables.

One of the potential challenges with measurement scales may be rooted in the definition of organizational citizenship behavior. The definition states that organizational citizenship behavior is *discretionary behavior* that is *not directly or formally compensated by the organization's reward system*. However, some organizational citizenship behavior measures include items that respondents may consider to be requirements of the job, not discretionary or voluntary behaviors (e.g., Morrison 1994), and some studies have suggested that voluntary organizational citizenship behavior is just as likely to lead to rewards as required job tasks (e.g., Werner 1994). Still others suggest that organizational citizenship behavior does not have to be voluntary or nonrewarded, but it must contribute to the enhancement of the context of work (Borman and Motowidlo 1993). If researchers and respondents are inconsistent or unclear on whether measurement items are voluntary versus required or rewarded versus unrewarded, the measurement scales may reflect different constructs from what is expected. As the definition of organizational citizenship behavior evolves with organizational changes and research developments, the appropriate measurement should be matched to the appropriate research task.

## Antecedents and Consequences of Organizational Citizenship Behavior

Several research studies in the past 20 years have identified a number of antecedents and consequences of organizational citizenship behavior. Antecedents include personality traits such as conscientiousness, emotional stability and empathy (Borman et al. 2001), stressors (Eatough et al. 2011), attitudes such as commitment (Organ and Ryan 1995) and job satisfaction (LePine et al. 2002), perceptions of fairness (Organ and Ryan 1995), and supervisor relationships (Podsakoff et al. 2000). Other variables such as procedural justice climate, service climate, and servant leadership have also been suggested as antecedents (Bambale 2014). Despite the large amount of evidence for these antecedents, however, Spector and Che (2014) found the relationships between these antecedents and organizational citizenship behavior changed depending upon how organizational citizenship behavior was measured. When they used an agreement-response scale asking the extent to which the individual agrees that the individual engaged in the behavior (1 = disagree very much to 5 = agree very much), results were similar to those found in previous studies. When they used a frequency-response scale asking how often the individual engaged in the behavior (1 = never, 2 = once or twice, 3 = once or twice per month, 4 = once or twice per week, and 5 = every day), results showed smaller or nonsignificant correlations. Their findings suggest that the measurement challenges mentioned above should be carefully considered before designing a research study and that organizational citizenship behavior may be a more complex behavior than previously indicated.

The effects or consequences of organizational citizenship behavior have been studied at both the individual level and the organization level. Meta-analysis results at the individual level indicate there are positive relationships between organizational citizenship behavior and job performance ratings and reward allocation decisions, but negative relationships between organizational citizenship behavior and turnover intentions, actual turnover, and employee absenteeism (Podsakoff et al. 2009). Continuance commitment and workplace social inclusion are also outcomes of organizational citizenship behavior (Ma et al. 2016).

At the organizational level, organizational citizenship behaviors are positively related to productivity, efficiency, profitability, and customer

satisfaction, but negatively related to costs and unit-level turnover (Podsakoff et al. 2009). Researchers have also found that organizational citizenship behaviors are related to performance outcome variables such as service response times (Hyatt and Ruddy 1997), corporate innovation and strategic renewal (Zhang et al. 2008), customer service (Yen and Niehoff 2004), profitability (Chuang and Liao 2010), and return on assets (Chun et al. 2013).

## Organizational Citizenship Behavior in Public Administration

Although organizational citizenship behavior has been studied extensively in for-profit organizations and related to effective organizational productivity, researchers have also examined organizational citizenship behavior in the public sector, although the number of studies is relatively small compared to the private sector. These public sector studies have examined change-oriented organizational citizenship behavior in public organizations (Vigoda-Gadot and Beeri 2011), organizational citizenship behavior as predictor of a voluntary military career (Annen et al. 2015), and public service motivation as a predictor of organizational citizenship behavior in the public sector (Mostafa and Leon-Cazares 2016). Much of the public sector research focuses on identifying antecedents of organizational citizenship behavior, with public service motivation being a key variable of interest. Researchers have indicated that public managers should attempt to encourage organizational citizenship behaviors to promote more effective organizational operations, suggesting that research on organizational citizenship behavior in the public sector may increase in the near future.

## Conclusion

Research on organizational citizenship behavior has helped redefine the way job performance is measured, taking into account the (sometimes) unmeasured behaviors necessary to effective organizational functioning. Formal performance evaluations may not directly measure these behaviors, but studies indicate that increased organizational citizenship behavior leads to increased performance, increased pay, increased continuance commitment, and increased social inclusion. It also leads to decreases in turnover and employee absenteeism. Thus, during the hiring process, managers should be aware of applicant characteristics that may predict organizational citizenship behavior such as conscientiousness, emotional stability, and empathy. Managers should also be aware of their own characteristics or leadership styles in creating an environment that encourages employees to engage in organizational citizenship behavior such as exhibiting servant leadership and creating a climate that is perceived as fair and just.

# Organizational Citizenship Behavior: A Holistic Review

Osama A. Hazzi
University of Vienna, Vienna, Austria

## Synonyms

Altruism; Conscientiousness; Prosocial organizational behavior

## Definition

Organizational citizenship behavior is defined as the behavior that is not an enforceable requirement of the role, does not aim at earning rewards, is not an expressive behavior owning to emotional

state, and that in the aggregate promotes the welfare of the individual and organization.

## Introduction

The greater scholarly interest in Organizational Citizenship Behavior (OCB) teed off in the early of 1983 when Organ and his colleagues (Smith et al. 1983) first coined the term of "organizational citizenship behavior". Since then, the literature has increasingly dominated on this topic. Web of Science Core Collection includes more than (800) works on OCB from the period 1980 to 2016. Those works have been documented in several document types (including articles, book chapter, book review, book, proceeding paper, review, editorial material, note, meeting abstract, and correction). The interest in OCB has also expanded into other disciplines including Human Resource Management (HRM), industrial and labor relations, community psychology, marketing, sociology, public administration, sports science, healthcare services, nursing, computer science, engineering and communication (cf. Podsakoff et al. 2000, 2014). This interest might be attributed to the reason that the academic and professional communities have begun to realize the importance of such behavior. Indeed, OCB plays an important role at the individual and organizational levels (Podsakoff et al. 1997, 2009).

The growing interest in OCB undoubtedly has been gratifying to those interested in such behavior. Nevertheless, it has resulted in some confusion about the construct itself. It is, therefore, not surprising to find that many readers are avid to keep up with the developments in this domain and pay more attention to the issue like how OCB took shape over the time. This drives one to argue that there is a need to pay close attention to the specific types of OCB, antecedents, and consequences on both individuals and organizations to better understand OCB. For this, this work aims to examine the prominent literature on OCB identifying the emergent and notable topics in this domain in order to provide a reader some insights derived from different key themes. More specifically, this work answers the following main question: *what are the most developments which have occurred on OCB since the eighties of the last century to this day?*

Within the context of the earlier discussion, this work is organized into the following sections. First, it provides the methodology used to explore literature on OCB. Next, it amply provides the theoretical background in OCB and grounding in its types. Following this, the work synthesizes the antecedents and consequences of OCB derived from the existing literature. Finally, it presents limitations, implications, and potential conceptualizations. The discussion here is not about hypotheses to be tested or even methodology in the usual sense. In the main, the agenda here is more limited to a review on OCB with a view to providing to a reader a way of thinking about such behavior that we can be comfortable with.

## Methodology

To better understand OCB, a gist of an integrative literature review was conducted for conceptualizing the aims of this work. To address the research question, the following keywords were used (including organizational citizenship behavior, extra-role behavior, contextual performance, nature of organizational citizenship behavior, dimensionality of organizational citizenship behavior, types of organizational citizenship behavior, antecedents of organizational citizenship behavior, determinants of organizational citizenship behavior, predictors of organizational citizenship behavior, consequences of organizational citizenship behavior, and implications of organizational citizenship behavior). A few of these keywords were regularly used in several meta-analytic review studies (cf. Carpenter et al. 2014; LePine et al. 2002; Organ and Ryan 1995; Podsakoff et al. 2009).

Web of Science Core Collection was included in the keyword search process so that the refereed academic journal articles and review were only included in the search parameters (excluding book chapters, conference proceedings, and trade publications). To get precise and true results, the

keywords were searched in only the titles of the articles. However, the most top most results were included (Journal of Applied Psychology, Journal of Organizational Behavior, International Journal of Human Resource Management, Journal of Business and Psychology, Journal of Applied Social Psychology, Academy of Management Journal, and Journal of Management) taking into account the journal that Organ and Ryan (1995) mentioned (i.e., Personnel Psychology) and the other main works that the OCB literature addressed (e.g., Brief and Motowidlo 1986; Motowidlo 2000; Organ 1997, 1988). This way would better display the most prominent studies in the domain of OCB.

## Theoretical Background and Rationale

As indicated in the literature, Barnard's concept of "willingness to cooperate" was somehow expressed in three main behavioral patterns, i.e., joining and staying in the organization, meeting or exceeding the specific standard of performance, and behaviors that go beyond specified role requirements. In the early of eighties of the last century, Smith et al. (1983) presented the third pattern in a way revealing the concept of OCB. Organ and colleagues posited that OCB rests on the theoretical foundations of Social Exchange Theory (SET), which is one of the most influential conceptual paradigms in organizational behavior and conceptualizes social relations in terms of exchange processes. In terms of OCB, SET means that employees engage in OCB to reciprocate good treatment received from a co-worker, supervisor, or the organization. Other theories might provide a different way of considering OCB. Namely, Social Network Theory (Social Network Analysis, SNA), which is a perspective specifically designed to focus on relationships, and Team Member Exchange Theory (TMX), which is a perspective exploring the quality of social exchange relationships within work groups. SET is still considered as the prevalent explanatory framework of OCB. However, scholars have revisited on SET to better understand types of performance-prosocial behavior including OCB.

In his monograph, Organ (1988, p.4) defined OCB as "individual behavior that is discretionary, not directly recognized by the formal reward system, and that in the aggregate promotes the effective functioning of the organization". By discretionary, Organ means that behavior is not an enforceable requirement of the role; hence it is rooted in an individual's intrinsically motivated effort and does not aim at earning rewards (Organ 1988) and does not represent expressive behavior owing to emotional states (Organ and Konovsky 1989). In other words, OCB is rather a matter of personal choice. Indeed, it is believed that OCB is far more complex than is generally considered, so criticisms about previous definition may still on. OCB, for example, may not always be discretionary if it is expected by supervisor and co-workers (Morrison 1994). According to this view, Morrison provided evidence showing that 18 of 20 OCB items were described by a majority of respondents as "in-role." Nevertheless, one could interpret this perspective as more of a measurement issue rather than a construct problem (Organ 1997). Within this context, the distinction between in-role and OCB is one that both employees and managers have difficulty recognizing (Podsakoff et al. 2000).

Organ (1997), however, admitted to some "discomfiting softness" in a "working definition" of OCB. He made this admission in a chapter titled "Unfinished Business". He revisited on the definition to say that OCB is "performance that supports the social and psychological environment in which task performance takes place" (Organ 1997 p. 95). By way of explanation, OCB can be considered as the self-management of employees to improve the organizational effectiveness. However, there is still ambiguity in many readers concerning the definition itself. This might be traced back to the overlap among many constructs of what we call Extra-Role Behavior (ERB) including Prosocial Organizational Behavior (POB), OCB, and Whistle-Blowing (WB). OCB was in the early research described as being analogous to prosocial behavior (Bolino et al. 2013). This view was supported by (Chiaburu et al. 2011). Indeed, Brief and Motowidlo (1986), who first identified

the concept of prosocial organizational behaviors, have categorized OCB as prosocial organizational behavior. Other studies (e.g., De Cremer et al. 2009) operationalized prosocial behaviors by using measures of OCB. Both Organizational Citizenship Behavior toward Individuals (OCB-I) and Organizational Citizenship Behavior toward Organization (OCB-O) have been also shown to include prosocial behaviors targeted toward individuals and organization (Carpenter et al. 2014).

The literature indicates that there are occasions where the same concept has been addressed in different labels by different researchers (Podsakoff et al. 2000). Interestingly, the experience shows that the same concept could be also used in different labels by different cultures. This goes for the concept of OCB. For example, the prevailing culture, in particular the relevance of religion in Arab entrepreneurship where the label of OCB is not well-known, encourages people to engage in helping behaviors and exhorts them to engage even more in such behaviors even if that is not required. However, the current search results found that the five kinds Organ (1988) has proposed, i.e., altruism, courtesy, sportsmanship, conscientiousness, and civic virtue, as well as the two forms Williams and Anderson (1991) coined, i.e., OCB-I and OCB-O, were the most widely used labels by researchers. This is consistent with previous studies. It was stated that scholars generally tend to use the Organ's (1988) five-dimension framework and this can be traced back to the reasons that this framework has the longest history and that Organ and his colleagues have been very prolific in the domain of OCB (LePine et al. 2002).

Here are some examples which either used the Organ's (1988) five-dimension framework or the studies based on such framework (cf. Coyne and Ong 2007; Lavelle et al. 2009; Lin 2008; Niehoff and Moorman 1993; Yen and Niehoff 2004). Other studies (e.g., Konovsky and Organ 1996) used both the two dimensions designed by Smith et al. (1983) and three dimensions originally discussed by Organ (1988) including sportsmanship, courtesy, and civic virtue. The literature includes further examples (e.g., Podsakoff et al. 1997) that concentrated primarily on helping behavior, sportsmanship, and civic virtue, as well as it shows different labels of OCB (including interpersonal helping, individual initiative, personal industry, loyal boosterism, personal support, organizational support, conscientious initiative, and organizational citizenship behavior for the environment). As a matter of fact, most of the labels mentioned earlier, if not completely all, can be somehow traced back to the original source of Smith et al. (1983).

According to Smith et al. (1983), OCBs include at least two kinds: (1) altruism, which means helping other individuals (e.g., helping others who have been absent and helping others who have heavy workloads); and (2) generalized compliance, which refers to a more impersonal form of conscientious citizenship (e.g., not spending time in idle conversation during the work, and making innovative suggestions to improve department). Nearly 5 years later, Organ (1988) proposed an expanded taxonomy of OCB including three other kinds, i.e., courtesy, civic virtue, and sportsmanship. Courtesy is much like altruism and civic virtue is much like generalized compliance and conscientiousness, while sportsmanship could be defined as a willingness to tolerate the impositions work without whining. Good examples of such behaviors include consulting with others before acting, keeping up with issues affecting the organization and not complaining about trivial matters, respectively. It is worth mentioning here that Organ (1988) relabeled generalized compliance conscientiousness. Concerning this point, Organ touched that the word "compliance" was unflattering and unfair to people who scored high on this dimension, and that it seemed to suggest something lacking in power or confidence. This form of OCB, however, took different labels in the literature (e.g., prosocial organizational behavior toward organization in the study of Brief and Motowidlo 1986, and OCB-O in the study of Williams and Anderson 1991).

## Antecedents of Organizational Citizenship Behavior

Generally, literature addresses two prominent approaches in the context of the antecedents of OCB; SET, aforementioned; and functional

motives theory, an approach emphasizing fulfillment of individual needs as a primary driver of helping. Employee characteristics (more specifically, employee attitudes "moral factor" and dispositional variables) and leadership behaviors were most frequently considered by OCB researchers. This is consistent to some extent with previous studies (cf. Arthaud-Day et al. 2012; LePine et al. 2002; Organ and Ryan 1995; Podsakoff et al. 2000, 2014). Related to the above, this work divides the antecedents of OCB into two main groups: (1) employee characteristics and (2) leadership behaviors. Other miscellaneous antecedents were also addressed.

### Employee Characteristics

In this category, moral and dispositional factors are of most interest by many OCB researchers. Namely, organizational justice, organizational commitment, and job satisfaction are most often used to exemplify the employee attitudes, while agreeableness and conscientiousness are the most examples used of dispositional variables. Compared to organizational commitment, job satisfaction, and other dispositional variables, the current review also found that organizational justice is the most widely used predictor of OCB. This is largely consistent with the findings of previous studies (cf. Arthaud-Day et al. 2012; LePine et al. 2002; Organ and Ryan 1995; Podsakoff et al. 2000).

#### Organizational Justice

Justice has been considered the most robust predictor of OCB (Organ and Ryan 1995). The earliest studies have reported a link between organizational justice and OCB. Generally speaking, there is a consensus that both distributive and procedural justice are the main forms of organizational justice. While distributive justice was derived from Adams' equity theory that states that perceptions of distributive justice resulted from comparing personal outcome-contribution ratios, procedural justice was developed by Thibaut and Walker' works stemmed from observations of courtroom settings. On the one hand, interactional justice, which is considered as another form of justice, has come to be seen as consisting of two types of justice. The first, interpersonal justice reflecting the extent to which people an individual is treated with respect by those determining outcomes. The second, informational justice focusing on the explanations provided to an individual that convey information about why procedures were used in a certain way or why outcomes were distributed in a certain fashion. However, there is an ongoing debate as to how organizational justice takes place in practice – especially regarding the issue of dimensionality.

Concerning its influence on OCBs, organizational justice directly influences OCB (Niehoff and Moorman 1993). They found that there is a significant and positive relationship between formal procedures, which was used as measures of procedural justice, and courtesy, sportsmanship, and conscientiousness. By way of explanation, employees who perceived fairness in the formal procedures for decisions and the outcomes of their performance showed higher level of OCBs. Their findings, however, showed that there is a negative relationship between interactional justice, which was also used as a measure of procedural justice, and sportsmanship, and that distributive justice failed to influence any of OCBs. Within this context, one could argue that distributive justice might be better justified through economic exchange theory, rather than SET. Further, an independent effect of fairness on each of altruism, generalized compliance, courtesy, sportsmanship, and civic virtue was affirmed (Konovsky and Organ 1996). In the last decade, more research have studied the link between organizational justice and OCB. It was shown that there is a link between procedural justice and OCB-O (Lavelle et al. 2009), and that this kind of justice represents one of the most predictors of OCB (Arthaud-Day et al. 2012). Over and above, there are further studies that showed organizational justice is a significant predictor of OCB (Podsakoff et al. 2014).

One could argue that the literature shows a degree of consensus that justice can play a crucial role in securing organizational effectiveness and enhancing the personal satisfaction of employees, and that justice represents a significant concern for both the organization and its members. Injustice, accordingly, might signal that organization does not value its employees and lead to demotivate

them. On the one hand, the literature includes a different taxonomy of organizational justice theories and calls for more studies based on employees in organizational settings. What is hoped for is to go beyond the well-established theories of justice as the evolution of the workplaces demands their revision.

### Job Satisfaction

Job satisfaction is one of the most predictors of OCB (Podsakoff et al. 2014). Indeed, the literature includes studies (e.g., Chiaburu et al. 2011) showing that job satisfaction predicts OCB. Further, several studies have expanded the satisfaction-OCB link. Smith et al. (1983) is a good example of that. They showed that job satisfaction, as a measure of chronic mood state, influences altruism. Using meta-analysis, Organ and Ryan (1995) have concluded that the relationship between job satisfaction and OCB is stronger than the relationship between job satisfaction and in-role performance. In another study, Konovsky and Organ (1996) indicated that job satisfaction has an independent effect on each of altruism, generalized compliance, courtesy, sportsmanship, and civic virtue. Later, two critical studies showed that there is a significant and positive relationship between job satisfaction and OCB (LePine et al. 2002; Podsakoff et al. 2000). Indeed, the literature is rich with many studies showing the effect of job satisfaction on OCBs.

Further, there are studies addressing both intrinsic and extrinsic satisfaction as two forms of job satisfaction. In other words, those studies separated job satisfaction into different dimensions (i.e., intrinsic and extrinsic satisfaction). While the first expresses the extent to which an employee receives satisfaction from the job itself such as job variety, the latter expresses the extent to which an employee has with work conditions which are unrelated to the job itself. Such issue drives us to argue that one should recognize that job satisfaction and motivation are not the same thing. It is believed that it is easy to separate cognitive and affective aspects of satisfaction at the conceptual/theoretical level, but it is not easy to do at the measurement level because they are confounded in the person.

### Organizational Commitment

Many studies (e.g., LePine et al. 2002; Organ and Ryan 1995) concluded that organizational commitment has been considered as one of the most robust predictors of OCB, and that it is one of the most commonly identified predictors of OCB (Arthaud-Day et al. 2012). Podsakoff et al. (2000) have showed that there is a significant and positive relationship between organizational commitment and different kinds of OCB (e.g., altruism, generalized compliance, courtesy, conscientiousness, sportsmanship, and civic virtue). In another study, it was stated that there are several studies focused on identifying the antecedents of OCBs and showed that organizational commitment is one of the most predictors of those behaviors (Podsakoff et al. 2014). Furthermore, a significant and positive relationship between commitment and both OCB-I and OCB-O was found (Lavelle et al. 2009). According to their findings, OCB-O is more strongly predicted by organizational commitment than by workgroup commitment, whereas OCB-I is more strongly predicted by workgroup commitment than by organizational commitment. They have also found that organizational commitment fully mediated the relationship between procedural justice and OCB-O, and workgroup commitment fully mediated the relationship between workgroup procedural fairness and OCB-I. Conversely, other studies (e.g., Williams and Anderson 1991) found that organizational commitment has no a significant relationship with OCBs.

### Dispositional Variables

In addition to employee attitudes, or moral factors, dispositional variables are considered as a crucial part of the employee characteristics. The current search results found that conscientiousness and agreeableness are the most used in the literature to exemplify the dispositional variables. Indeed, the literature showed that both are common predictors of OCB (Ilies et al. 2009) and well-established five-factor model (FFM) predictors of OCB (Chiaburu et al. 2011). On the one hand, Konovsky and Organ (1996) have indicated that conscientiousness predicts some OCBs (including altruism, generalized compliance, and civic

virtue). Their findings, however, indicated that agreeableness failed to affect OCB. Later, Ilies et al. (2009) showed that conscientiousness is more closely related with OCB-O and agreeableness with OCB-I. They revealed that agreeableness has both direct and indirect effects on OCB-I but indirect effect on OCB-O, while conscientiousness has direct and indirect effects on OCB-O and indirect on OCB-I. In another study, it was found that both OCB-I and OCB-O are significantly correlated with conscientiousness (Arthaud-Day et al. 2012).

On the other hand, the three personality traits (emotional stability, extraversion, and openness/intellect) have incremental validity for OCB over and above conscientiousness and agreeableness (Chiaburu et al. 2011). It is worth noting that they found that conscientiousness, extraversion, and emotional stability have similar magnitudes of relationships with OCB and task performance, whereas agreeableness and openness have stronger relationships with OCB than with task performance. They stated that these findings support the idea that personality traits (including conscientiousness and agreeableness) are slightly more important determinants of OCB than of task performance.

### Leadership Behaviors

Several OCB scholars (e.g., LePine et al. 2002; Organ and Ryan 1995; Podsakoff et al. 2000) included various styles of leadership behaviors in their studies. This lends some support to the idea that such behaviors take the main place in the domain of OCB. The current search results argue that one could divide leadership behaviors into both transformational and transactional leadership behaviors as well as the behaviors identified by both Leader-Member Exchange (LMX) and Path-Goal theories of leadership.

Smith et al. (1983) is generally considered the first study that addressed the link between leadership behaviors and OCBs. They have found that altruism and generalized compliance are significantly related to leader supportiveness; one directly (generalized compliance), and the other indirectly (altruism – mediated by job satisfaction). On the other hand, Niehoff and Moorman (1993) found that observation, informal discussion, and formal meetings, as methods of leader monitoring, have direct and negative effects on OCBs (e.g., altruism, conscientiousness, courtesy, sportsmanship, and civic virtue). By way of explanation, when employees perceive that their leader observes their work or hold formal meetings concerned with work progress, they feel that their freedom to act is constrained. This eventually results in a reduction of their efforts to exhibit behaviors beyond their basic job descriptions.

On the one hand, other scholars (e.g., Podsakoff et al. 2000) have researched the relationships between the styles of leadership, aforementioned, and various kinds of OCB. According to their findings, transformational leadership behaviors have significant and consistent positive relationship with altruism, conscientiousness, courtesy, sportsmanship, and civic virtue, while both contingent reward behavior and noncontingent punishment behavior, kinds of transactional leadership behaviors, are significantly related to altruism, courtesy, conscientiousness, sportsmanship, and civic virtue; one positively (contingent reward behavior), and the other negatively (noncontingent punishment behavior). Also, their findings showed that supportive leadership behavior, a kind of Path-Goal leadership behaviors, is significantly positively related to all types of OCB, while role clarification behavior, kind of Path-Goal leadership behaviors, is significantly positively related only to altruism, conscientiousness, courtesy, and sportsmanship. In addition, their study found that LMX is significantly positively related to altruism and overall of OCB. However, Podsakoff et al. (2014) mentioned that there are many studies identified that transformational and transactional leadership behaviors, as well as LMX, significantly predict various kinds of OCB.

### Other Issues in the Antecedents of OCB

The literature includes other various variables which may have a relationship with OCB. Employee perceptions of an organization's investment in Corporate Social Responsibility (CSR) toward social and nonsocial stakeholders, employees, customers and government are good

examples of just that. The variable of citizenship fatigue, a phenomenon referring to the degree to which employees feel worn out to engage in OCB, and the variable of organizational virtuousness, a term referring to organizational contexts where virtues (like humanity and trust), were also researched with OCBs. Beyond these variables, practices of HRM including retention-oriented compensation and formalized training were studied in the OCB literature as well.

On the one hand, one should not overlook the variables like religion and values. It was reported that individual values influence OCBs above and beyond established predictors of personality traits and satisfaction (Arthaud-Day et al. 2012). By way of explanation, their findings found a significant, positive and direct effects for achievement, a dimension of individual values, on OCB-I, for benevolence on OCB-O, and for self-direction on both OCB-I and OCB-O. Within this context, prosocial values motives, a term referring to a desire to build positive relationships with others, Protestant Work Ethic (PWE) and spiritual leadership were also researched in the OCB domain.

On the other hand, there is some debate over the effects of demographic variables (e.g., gender, age, organizational tenure, education, and cultural background) on OCBs. For example, both education and urban/rural background affect altruism (Smith et al. 1983). Their study showed that those who came from rural areas displayed more altruism than those who came from large cities. However, other studies (e.g., Organ and Ryan 1995) have proved that there is no connection between organizational tenure and gender and altruism. Podsakoff et al. (2000) also provided an evidence showing that demographic variables generally have not been found to be related to OCBs.

To summarize, the employee attitudes (more specifically, employee characteristics; organizational justice, organizational commitment, job satisfaction, and dispositional factors; agreeableness and conscientiousness) and leadership behaviors (specifically, transformational and transactional leadership behaviors, and LMX) are considered the predominant antecedents of OCB in the literature. However, one should not overlook the importance of the other antecedents aforementioned.

## Consequences of Organizational Citizenship Behavior

This work concluded that most of research efforts focus more on the antecedents of OCB. A reason for this may back to the OCB definition. It assumes that OCB would enhance the organizational effectiveness. This might have driven scholars to not explore the potential implications of OCB. More recently, several scholars have increasingly focused on examining the outcomes of OCB at both individual- and group/organizational levels. It was argued that it is important to draw up a complete picture of the potential effect that OCBs have on the "bottom line" of the organization and to well explore the relationship between such behaviors and organizational effectiveness criteria (Podsakoff et al. 2009). According to their work, no work has been reported that summarizes the research regarding the relationships between OCB and its individual- and organizational-level outcomes. In this section, these two levels were examined.

### Individual-Level Consequences

The earliest studies affirmed that OCB represents a functional prosocial behavior (Brief and Motowidlo 1986) and fosters individual performance (Organ 1988). Using a critical review, Podsakoff et al. (2000) have argued that managers consider OCBs/contextual performance in their employee performance evaluations. They showed that OCB/contextual performance significantly and positively affects the personnel decisions made by managers. In this regard, one should not overlook that there is a difference between OCB and Contextual Performance (CP). Originally and persuasively outlined, OCB was derived from an interest in behavioral consequences of job satisfaction and was defined as behaviors that managers want their subordinates to do but could not ask them to do (Motowidlo 2000), while CP was derived from two facets identified by Van Scotter and Motowidlo (1996), i.e., interpersonal

facilitation (e.g., cooperative, considerate, and helpful acts) and job dedication (e.g., self-disciplined, motivated acts, and following rules to support organizational objectives) and was defined as these contributions to the "context" in which groups perform. Although one could argue that CP looks more typically discretionary, but it contributes to the maintenance and/or enhancement of the context of work (Organ 1997). Organ incisively stated two features making CP differs from OCB, i.e., CP does not require that the behavior be extra-role nor that it be non-rewarded. However, CP is virtually identical to Organ's (1997) conception of OCB, but one can argue that it differs from more cognitive and attitudinal constructs such as job involvement and organizational commitment.

Podsakoff et al. (2009) indicated that OCBs are significantly and positively related to managers' ratings of employee performance and to the rewards managers allocate to employees. On the other hand, the literature includes studies showing no significant relationship between Performance-Related Pay (PRP), a compensation system rewarding performance on an individual or group basis, and OCB. This might get back to the reason that Smith et al. (1983) have stated. They claimed that OCB is not easily governed by individual incentive schemes. Within this context, other studies have deduced that OCB would have a relationship with turnover. Podsakoff et al. (2009) have indicated that OCBs are significantly and negatively related to employee turnover, turnover intentions, and employee absenteeism.

On the one hand, Yen and Niehoff (2004) showed that different kinds of OCBs (more specifically, altruism, conscientiousness, civic virtue, interpersonal harmony, and protecting company resources) are significantly and positively related to an individual-level measure of customer-service behavior as rated by supervisors. In addition, Podsakoff et al. (2011) found that the job candidates showing higher levels of OCBs (more specifically, helping behavior, voice behavior, a behavior challenging the status quo and promoting a positive change in the organization, and loyalty behavior) are rated more competent, receive higher overall evaluations, and receive higher salary recommendations that those showing lower levels of these behaviors.

### Group/Organizational-Level Consequences

In addition to the individual-level outcomes of OCBs, OCBs are expected to have effects on the unit or organizational outcomes. The current search results found that most studies were directed at the group/organizational level more than the individual level. Organ (1988) was one of the early studies in this area. He has found that OCB fosters the performance of the organization. Studies like (Podsakoff et al. 1997) indicated that helping behavior significantly affects both quantity and quality of work-group performance, and sportsmanship significantly affects only performance quantity, but civic virtue has no effect on either performance measure. In another study, Podsakoff et al. (2000) showed that OCBs are generally related to organizational effectiveness. More specifically, helping behavior and sportsmanship would generally enhance organizational performance, while civic virtue enhances the quantity of organizational performance and reduced customer complaints.

The literature includes other studies (e.g., Yen and Niehoff 2004) suggesting that various kinds of OCBs (more specifically, altruism, conscientiousness, civic virtue, interpersonal harmony, and protecting company resources) significantly relate to a number of the indicators of the organizational effectiveness. By way of explanation, these behaviors are significantly and positively associated with employee customer-service behavior. That is, employees showing high levels of OCB are more likely to be rated as better at serving customers. According to Yen and Niehoff, altruism and civic virtue only are significantly and negatively associated with labor cost, a measure of efficiency, while conscientiousness and interpersonal harmony are significantly and positively related to unit profit. Their findings also included that customer's perceptions of service quality and perceived expertise of employees are significantly and positively associated with conscientiousness, and customers' willingness to cooperate is

significantly and positively associated with all of OCBs except civic virtue, while customers' trust is no associated with any of OCBs.

In the last decade, several studies have increasingly examined the OCBs at group/organizational level. Coyne and Ong (2007) illustrated that all of the OCB scales (with exception of altruism) significantly and negatively related to turnover intention across cultures. By way of explanation, those who had stronger intentions to leave were less likely to show OCBs (especially sportsmanship behaviors) at work. In this respect, cultural differences in OCB ratings were found. Their findings showed Malaysian employees exhibit more OCBs than German or English employees. OCBs such as altruism, courtesy, conscientiousness, civic virtue, and sportsmanship influenced knowledge sharing (Lin 2008). According to Lin, knowledge sharing can improve the organizational effectiveness, and that gender can play an important role as a moderator in the relationship between these behaviors and knowledge sharing. Lin also stated that influences of both courtesy and sportsmanship on knowledge sharing are stronger for men than for women, and the influence of altruism on knowledge sharing is stronger for women than for men, while the influences of both conscientiousness and civic virtue on knowledge sharing are similar between women and men.

Since OCBs have been found to be related to group and organizational effectiveness, it was revealed that OCBs are significantly related to a number of organizational-level outcomes (Podsakoff et al. 2009). According to their findings, they noted that OCBs increase customer satisfaction and decreased group- and/or unit-level turnover. On the one hand, Podsakoff et al. (2014) have concluded that OCBs are significantly related to various important unit-level outcomes, including quality and quantity of manufactured products, measures of profitability, efficiency sales, customer satisfaction, service quality, academic achievement, and employee retention. To summarize, OCB have essential effects on individual and unit/group/organizational levels. That is, OCB can promote the welfare of an organization and its members alike.

## Conclusion

Like any other work, there are some limitations in this work which, in turn, might present potential opportunities for further research. In this section, limitations and implications were demonstrated. Then, this section would provide some potential conceptualizations in the domain of OCB.

### Limitations and Implications

The current work only used Web of Science Core Collection to address the available OCB works and mainly concentrated on the articles, reviews, and the most top search results. Although those results included leading journals with high impact factor, one should not overlook the fact that there are other studies may have an influence on one's judgments. For instance, Bolino et al. (2013) mentioned that some studies that suggest the relationship between OCBs and the performance of employees, teams, and organization may be less straightforward that it is assumed to be. However, some of those studies did not show in the search results. One, therefore, could argue that the matter here is about the quantity rather than the quality. For this, the current review suggests that further works should include other research platforms like Scopus and EBSCO Academic and other citation sources (including books, conference proceedings, and other trade publications). This would better help future studies to show extensively miscellaneous findings.

This work focused more on the most antecedents and consequences of OCB used in the literature. It would be worthwhile for future studies to extensively explore the other relationships between OCB and its other antecedents and consequences. To this end, the current work added a separate section titled "Other Issues in the Antecedents of OCB" including some examples of the various variables of those antecedents. Furthermore, the current work concluded that little is known about the consequences of OCBs. Indeed, this result is consistent with the findings of the previous studies. This drives, therefore, one to suggest that future studies had better devote on studying the relationships between OCBs and their consequences.

Last but not the least, the current work included some of the most prominent meta-analysis studies. However, the work did not include the findings in numerical forms. This approach – although this work believes that it is not always efficient – may demonstrate to which degree the relationships between OCB and its antecedents and consequences are strong, and help the researchers to investigate the reasons of the weaknesses in those relationships. This would drive one to reconsider and include such approach in the further studies with a view to better understand OCB.

Finally, this work showed that there is a rich literature addressing OCB, and that the light side of OCB clearly takes a place in the literature. Nevertheless, it was cited in this work a few researchers (e.g., Bolino et al. 2013) arguing that OCB has dark side. What is hoped for is to investigate the dark and light sides of OCB. This would open the door for further studies to better determine the features of both sides and the extent to which they can influence the welfare of the organization and its members, and then to take a more nuanced view of OCBs.

### Potential Conceptualizations

One of the keys in OCB definition is that this behavior may vary across individuals because it could be either instinctive or acquired. Because of this fact, organizations and practitioners (e.g., HR managers) interested in OCB can consider the following conceptualizations.

HRM can play an essential role in securing and developing OCBs. Indeed, the literature shows that OCB has expanded into different disciplines including HRM, and that the practices of HRM were studied in the OCB literature. Thence, it would not be surprising to find that stimulating and developing OCBs are within the HRM agenda in many organizations. HR managers may obtain a good indication of an employee's intention to quit by noticing any withdrawal of OCB. It would be worthwhile that HR managers occasionally measure OCBs. One, however, should not overlook the fact implying that the prevailing measures of OCB in the Western societies do not necessarily fit with the other ones. Within this context, the argument of using self vs. other rating of OCB (including co-worker or supervisor rating) is still a matter of dispute. For this matter, organizations could work on both styles and compare the results. This would help organizations to have a more accurate evaluation of OCBs.

Furthermore, managers could offer supportive opportunities to their subordinates (e.g., allowing employees to attend certain meetings to develop relationships with executive staff, or providing them information which would enhance productivity). In this way, subordinates would engage in OCBs fitting their aspirations, and managers can also avoid wrongly assigning their subordinates to a job requiring a low (high) level of OCBs with a high (low) propensity to engage in such behaviors. The manager could also assign their subordinates inclined to engage in OCBs to jobs involving TMX relationships. This would achieve more efficiency.

Since OCB often promotes the welfare of the organization and its members, one could argue that it would be worthwhile to call for more research on this domain in different contexts with a view to better understand the theoretical and empirical mechanisms of the relationships between such behavior and the renewed content of its antecedents and consequences. What is hoped for is to freely think out of the box and to go beyond the well-established theories because the renewed evolution of our social structures and the workplaces drive many of us to rethink about those theories and even to refine most of which.

Overall, this work used the most prominent existing body of OCB providing insights into how scholars have researched this behavior from different key themes that need attention, and raising questions of where one goes from here, where the gaps are in this domain, and what other meta-analyses might be conducted that would settle other issues so that we could better proceed along some issue or another. What is hoped for is to investigate how all motives can influence not only the quantity or frequency of OCB performed but its quality as well, and that how such those motives influence the outcomes of such behavior. Notwithstanding the limitations mentioned above, these conceptualizations, however, could be materialized.

# Organizational Collaboration

Christian L. Janousek
University of Nebraska Omaha, Omaha, NE, USA

## Synonyms

Association; Cooperation; Coordination; Exchange; Network; Partnership; Synergy

## Definition

The act of two or more organizations voluntarily working together through a joint combination of personnel, resources, and information toward a common purpose, mutual benefit, or shared objective.

## Introduction

The demands of the modern public environment often require pluralistic solutions. The increasing magnitude of public problems may extend these demands beyond individual organizations, and the programs and services that are designed to address such problems frequently compel the inclusion of multiple actors. The integration of public issues across institutions of various levels of government, nonprofit, and private entities has produced an atmosphere of cooperative necessity toward mutually beneficial outcomes. Organizational collaboration represents a means by which public organizations may pursue alternative options for policy, program, and service delivery that harness the advantages of combined efforts and synergistic processes. In this way, organizational collaboration brings organizations together for a common purpose, utilizing the strengths and resources of each other to confront complex societal problems in the public realm.

By definition, organizational collaboration involves two or more organizations working in coordination through some form of collaborative structure that enables the sharing of personnel, resources, and information toward a joint objective or result. In public administration, the need for organizational collaboration has escalated in recent years, given the wide expanse of public policy areas, the multitudinous nature of public issues, and the growing focus on performance efficiencies. Nevertheless, organizational collaboration does not simply happen. Building these types of functional relationships among a variety of actors entails certain procedures, theories, practices, and an understanding of the different components and characteristics that constitute organizational collaboration in public administration, public policy, and governance.

## Organizational Collaboration in the Public Sector

The ability to organize and manage organizational collaborations often relies upon the conditions and requirements of the process itself. In particular, in the public sector, collaborative management involves inherently public procedures and values that are exclusive to the operation of organizational collaboration among public agencies. Yet, the nebulous and pervasive character of modern public problems affirms a corresponding pressure on public managers to understand and be capable of utilizing an array of collaborative remedies both within and outside of the public sphere. As such, based on definitions and features presented by Bingham et al. (2008), the concept of collaborative public management refers to the coordination of reciprocal relationships among various organizations that span across sectors and boundaries, seeking bilateral or multilateral solutions for joint actions and ambitions. In this context, the exceedingly interrelated nature of public policies

and programs supports multifaceted approaches suitable for engaging and synchronizing a range of organizations toward common problems and objectives. Thus, organizations must be aware of the various qualities of public collaboration in order to conduct these types of partnerships.

First, collaboration may occur both within and across organizations and sectors. Multi-organizational and multi-sectoral collaborations are commonplace among public entities, especially among various levels of government. This is due in part to the dynamic and overlapping tendencies of public problems, which often exceed the boundaries and capacities of single organizations. Next, collaborations may combine similar or dissimilar organizations with shared or competing interests and goals. In the contemporary public setting, the use of private or nonprofit organizations for public purposes has emerged as a viable alternative in collaboration. However, these organizations may possess diverging objectives and intentions for collaborating. This reiterates the importance of reciprocity, mutuality, and a reconciled cooperation in the administration and management of the collaboration.

Collaboration in the public sector may also occur within contentious environments and be subject to the scrutiny and participation of the citizenry. Public problems entail sensitive themes, often embroiling political ideologies and social values. What is more, public issues are complicated and require multiple actors, perspectives, and treatments. Invariably, public problems are likewise urgent and demand immediate attention, raising public awareness and involvement in the process. Many types of collaboration stem from a need for organizational assistance during emergencies or disasters, which tend to compound the situation. Some level of public participation is also expected in collaborations that involve public organizations. Ensuring aspects of accountability, responsiveness, efficiency, and transparency may further add to the collaborative undertaking. These characteristics are unique to the public sector and may exacerbate differences in purpose among inter-sectoral collaborators.

Finally, because of the publicness of organizational collaboration in the public sector, these types of collaborations will inevitably involve an assortment of actors and participants. In addition to citizens, collaborations of public organizations may also include elected officials, regulatory agencies, bureaucratic representatives, administrative professionals, and various sorts of advocacy and interest groups. Collaborating organizations must recognize the roles and contributions of these actors and incorporate amenable processes within the collaborative structure to accommodate the demands of public procedure. Given these qualities, organizational collaboration in the public sector is distinct, and often this environment has an impact on the needs and reasons for collaboration among public organizations.

## Initiating Organizational Collaboration

In the public sector, organizations enter into collaborative relationships for many purposes. Foremost, there exists some need and desire to collaborate, an awareness by organizations that their interests align with other organizations and a potential for shared interest and benefit between those organizations. These organizations must also be capable and willing to enter into a collaboration and possess some motivation to do so. Often, in the public sector, this motivation is financial savings and improved efficiency, relating to the increasing demands on public organizations to provide public services and programs at the lowest costs possible. For public organizations, collaboration offers a combination of available resources, technologies, personnel, and information among organizations of a common mission, which provides opportunities for economies of scale and other mutual advantages.

Alexander (1995) distinguishes the premises and characteristics of interorganizational collaboration and coordination. By nature, collaboration is interactive and involves a certain degree of interdependence realized among participating organizations. In this fashion, organizational collaboration relies on a basis of inclusiveness, meaning that the foundation for cooperation and coordination among organizations depends upon the environment and the actions and behaviors of

other organizations that exist within that environment. The purposes for collaboration, then, are based on the common needs and wants of organizations operating within a shared environment, providing a reason and necessity for some type of exchange. Most importantly, this exchange is typically motivated by mutual benefit, the idea that collaborating organizations will receive an improvement or assistance that will exceed their current status of affairs. This often relates to some form of economic gain or enhanced organizational operation.

Following these premises, organizational collaboration is initiated by environmental demand, which often includes a finite amount of resources and a number of organizations competing for those resources. The environment then requires an organizational response, a notion of contingency theory, with an organization or organizations adapting to the circumstances of the environment. This creates both an interdependence among organizations as well as a symbiotic relationship of common objectives and interests. The similarities of organizations within a shared environment support a motivation for collaboration. However, collaboration entails transaction, referring to the organization's willingness and capacity to concede resources with the presumption of attaining access to other resources. Transaction costs relate to the associated effects, duties, and commitments that occur in the action of collaboration. The nature of these transactions generally depends upon the demands of the environment and the collective needs of the organizations, which contribute to different forms and types of collaboration.

## Organizational Collaboration: A Typology

Alter and Hage (1993) offer a typology describing the range of organizational collaborations, involving alternative varieties of linking mechanisms in cooperative endeavors among organizations that fluctuate in levels of formality, purpose, and structure. Hence, organizations pursue collaboration in different forms, reflecting the needs and extent of the collaboration and the reasons or goals for establishing the collaboration. Most often, collaboration between organizations originates from a common need and a perception of benefit by all entities participating in the collaboration. Once a potential for collaboration is identified, the need for the collaboration often dictates the nature and scale of the collaboration. Needs may vary from an intermittent, short-term, obligatory, or informal agreement to a more structured, confederated, long-term, joint entity or consolidation. Organizational collaborations, then, may range from relationships of limited, moderate, or high cooperation.

Within this typology, organizations may enter into more limited collaborations, such as limited-liability agreements or informal pledges or partnerships, in which participating organizations maintain a degree of autonomy yet exchange or pool general resources for mutual use and advantage. In these types of collaborations, organizations may share information or technology, assist each other during emergencies or catastrophic events, or lend equipment or other resources, mostly on a part-time or short-term basis. These collaborations are considered a more informal type of organizational interaction, with participating organizations continuing to make self-interested decisions and pursuing individual operations.

Moderate collaboration involves a higher degree of cooperation and interchange among participating organizations, with a more long-term and exact time frame. At a moderate level of collaboration, organizations demonstrate a more formalized basis for partnership, developing from a shared objective or bond that requires a stronger unit of connection. In these types of collaboration, organizations seek a more specific purpose and means of exchange with some sort of formal mechanism, such as a contract, that defines the methods and character of the relationship. As such, moderate organizational collaborations include contracted services, joint purchasing of equipment or use of personnel/resources, and consortiums for expanding the scope of services or leveraging political or policy interests. While organizations in moderate collaborations maintain some autonomy, the basis of exchange is more

distinct and established as opposed to limited types of collaboration.

High or broad collaboration represents the most formalized type of organizational collaboration. In these types of collaborations, participating organizations often create a separate entity or structure to enact the exchange, comprising a high level of formality and long-term commitment. Broad collaborations may include joint ventures or federations that involve a conglomeration of specific resources and coproduction among participating organizations. At this level of collaboration, organizations relinquish a considerable proportion of autonomy and act together in a mutual manner of operation.

## Implementing Organizational Collaboration

Following the initial necessity or circumstance that prompts organizations to pursue or engage in collaborative endeavors, the collaboration must be properly enacted. Thomson and Perry (2006) indicate several key dimensions toward collaborative action, which portray various components and stipulations of functional collaboration. In this regard, collaborations require some form of structure. The governance of collaboration refers to the acknowledgment and acceptance by collaborative parties of joint decision-making processes. This involves a balancing of interests, with recognition of negotiation and compromise and a commitment to collective responsibility. Collaborations also need administration to ensure correct operation. The inherent multiplicity of collaboration often demands administrative approaches beyond the traditional scope, placing emphasis on interdependency and the willingness to support agreement and unity among collaborating organizations. A critical part of the administration of collaboration is managing the different relationships within the collaborative structure to secure a fundamental level of coordination in implementation.

As organizations involved in collaboration maintain some degree of autonomy, self-interests may conflict with collective interests. Correspondingly, the interests of the collaboration may contrast with the interests of one or more of the individual collaborators. These situations often create problems of control, and collaborating entities may vie for more command over their own interests. As a result, collaborators must find ways to reconcile individual interests with the purposes and functions of the collective. In other words, there should be an expectation of mutuality, meaning a sharing of benefits and interests as well as accountability and risk. This also encompasses a factor of reciprocity, which involves a level of trust among collaborating organizations. In essence, there must be an expectation of fairness and equity among collaborators and a confidence in the compliance and dedication of all members to the collaboration. Therefore, the successful enactment of collaborative enterprise generally relies upon the identification and application of the appropriate approaches to managing the collaboration.

## Managing Organizational Collaboration

The management of collaboration can be complicated, given the interrelated nature of cooperation and the hosts of complexities abound for public agencies. From a public management perspective, organizational collaborations are differentiated from other internal or hierarchical forms of intergovernmental relations, substantiating an alternative approach to proper management and understanding. Agranoff and McGuire (2003) suggest that the need and structure of the collaboration will have important roles in managing it, expressly referring to the degree of formality established through the linking mechanism. This also involves the directional affiliation of the collaboration, being either through horizontal or vertical relations. Horizontal collaborative management comprises interactions with organizations of the equivalent governmental level or across sectors such as nonprofits or private businesses. These horizontal types of collaboration may be described as

networks. Within networks, a nonhierarchical relationship is established between collaborating organizations. These networks may assume various categorizations, ranging from informational/developmental networks that rely mostly on an exchange of solutions with implementation left to the individual agencies to more action-based networks wherein collaborative and interagency decisions and operations are realized.

In comparison, vertical organizational collaborations represent associations among differing levels of government, also referred to as intergovernmental management. In these types of relationships, transactions occur between national and local governments, which include intersecting policy and program areas that traverse governmental boundaries. Management in intergovernmental collaborations may involve elected officials in addition to organizational administrators, and the related differences in scope and function among collaborating entities may likewise add to management operations. In general, intergovernmental collaborations comprise actions such as financial funding, regulatory directives, and devolved programs and responsibilities. However, many vertical types of organizational collaboration now encompass auxiliary horizontal collaborations as well, alluding to the increasingly interconnected and expansive reach of modern public problems and service delivery.

Regarding the necessary skills of collaborative management, Agranoff and McGuire (2001) identify four classifications of collaborative manager behaviors: activation, framing, mobilizing, and synthesizing. Activation involves the coordination of personnel, expertise/knowledge, and resources needed for the collaboration. This relates to the structural composition of the collaboration, engaging participants, delegating duties and tasks, and assigning appropriate roles. In framing, managers enforce and maintain the mission and focus of the collaboration. Because collaborative actions incorporate a number of participants and, in some cases, conflicting organizational objectives, framing is a method by which managers attempt to forge connectivity and joint purposes through the support of mutual decision-making processes, contribution, and agreement. Mobilizing is an aggregated approach, initiating the movement of the whole collaboration toward a common end. Managers must continue to formulate strategic visions and coalitions within and among collaborating partners, which also entails leadership and motivational components. Finally, synthesizing refers to the fusion of the organizational collaboration, solidifying a shared outlook and functional exchange within the collaboration. In synthesizing, managers actively resolve contrasts among participants, establishing bases of trust and cooperation and addressing potential obstacles to collaboration. While distinguishable, these management behaviors may be needed simultaneously in most organizational collaborations, particularly as the forms and adaptations of collaboration for public organizations continue to modify and progress.

## Organizational Collaboration: Evolving Forms and Constructs

In their groundbreaking book *Reinventing Government*, Osborne and Gaebler (1992) discuss the potential for government to move beyond traditional paradigms of operation and service delivery, exploring opportunities and alternatives toward improved governance with a focus on entrepreneurship, competition, decentralization, and market-based approaches. A main premise is the ability of public organizations to utilize various techniques of innovation and enterprise to transform the reactive and cumbersome characteristics of government, instead seeking a more anticipatory and progressive form of public venture that incorporates customer needs, mission-driven results, and performance-based outcomes. In effect, government organizations can benefit from proven principles of the private sector, which include an emphasis on efficiency and inciting inventive options for achieving optimal organizational

outputs. The implications of these constructs are widespread throughout the public realm, invoking a reassessment of current procedures and ushering in a new era of government accountability and performance-oriented actions. Within this scope, organizational collaboration represents a possible element of the reinventing government and new public management movements, offering prospective cost savings and pioneering tactics for enhanced operations of public organizations.

Of mention is the use of cross-sector cooperation, pursuing collaborative organizational partnerships that extend beyond the public sector. Bryson and Crosby (2008) assert that cross-sector collaborations are emblematic of the evolving atmosphere of public organizations, as the number and span of functions assigned to modern organizations invariably overlap into a variety of sectors. These forms of collaborative partnerships include organizations from government as well as nonprofits, businesses, and other community-based organizations and entities. Cross-sector collaborations are generally initiated by the common catalysts of collaborative action, such as restricted resources and organizational needs. Cross-sector collaborations also indicate the increasing complexity of public problems and service provision, referring to the growing magnitude of societal issues and the limited capability of public sector organizations to address such challenges in a unilateral manner. An inherent obstacle for enterprises of this type is the contrasting missions of the various sectors. Accordingly, these forms of organizational collaboration require robust linking mechanisms that clearly enumerate the purpose for cooperation, a structure of formation, and a bonding agreement among all parties. Moreover, the related success of cross-sector collaborations depends on the functionality of the linkage, involving aspects of both formal and informal leadership and sponsorship, an understanding of legitimacy and accountability, and a continuous process of reciprocation through trust and conflict management.

In the context of cross-sector collaborations, or any form of interorganizational collaboration, the issue of boundary management epitomizes the multitude of impediments toward successful organizational cooperation. Kettl (2006) contends that the need and pressure to collaborate are often driving forces for public organizations to enter into such partnerships. However, the imperative to collaborate likewise involves the acknowledgement of organizational boundaries, defining the scope, ability, and extent of organizational operations, which impact the possibility of collaborating organizations to recognize boundary limitations and to overcome the intrinsic separations that boundaries often create. Simply put, collaboration necessitates a common and shared objective, which often conflicts with the established boundaries of individual organizations.

In particular, specific boundaries may complicate the approach to collaboration. The mission of organizations is a distinct boundary, providing a reason for organizational existence. Collaboration compels an expansion of mission and the need to work together toward joint purposes. The scarcity of resources among all organizations generates a protective boundary mentality. Organizations must be capable of relinquishing the boundaries of resources and commit to the collective need of the collaboration. The overall capacity of organizations to manage both internal affairs and collaborative interactions may strain boundaries. Limitations of capacity are often reasons for initiating the collaboration, but may also present further difficulties within the collaboration itself. Responsibility determines the boundaries of what an organization does or does not do, which firmly encapsulates the extent of organizational liability. In any form of collaboration, shared responsibility produces the potential for power struggles and disparate effort. The boundary of accountability is an essential stipulation for any collaborative endeavor. Given the multiple levels, sectors, and stakeholders involved in public organizational collaborations, accountability may be problematic especially when problems arise. In sum, collaboration in any form requires an integration of boundaries, which is generally counterintuitive for most organizations, and collaborators must be cognizant of the role of boundaries and the need for yielding to a mutual and cooperative goal.

## Conclusion

Understanding organizational collaboration in public administration and policy is an ongoing process, embodying the many characteristics and dynamics of these types of cooperative arrangements among public organizations. Organizational collaboration in the public sector has unique qualities, and public entities may enter into collaborations for a number of reasons. The varied purposes and contexts of organizations may incite challenges to successful collaboration. This is most notable in the public realm, comprising an array of competing ideals, values, stakeholders, and objectives. The operating environment of organizations may influence the needs and premises of collaboration, which lends to a basis for interdependency and coordination among collaborating partners. In these relationships, organizations must find common ground and acknowledge the various costs and obligations involved with collaborative enterprise. In addition, organizational collaborations may be substantiated through a range of linkages and affiliations that demarcate the term and formality of cooperation. Establishing a basis for exchange will determine the breadth and structure of the collaborative relationship, which may be limited to informal interactions of agreement and assistance or may create highly formalized conglomerations requiring intense commitment and mutuality.

Once initiated, organizational collaborations require proper implementation and management. Structural designs for collaboration need administration and governance, reconciling competing interests and developing a sentiment of shared accountability and trust. Managing collaborative endeavors introduces several undertakings for public managers, identifying the differing applications of vertical and horizontal transactions and maintaining a collective momentum among participants. Furthermore, recognizing the forms and constructs of collaboration helps organizations select the most viable and useful options and promotes awareness of the evolving demands and manifestations of the modern collaborative environment. Thus, organizational collaboration is an important practice in public administration, public policy, and governance, and attention to the changing landscape of actors and boundaries may improve the likelihood of collaborative outcomes and success.

# Organizational Commitment in the Public Context: A Voice from a Parallel Planet

Mohamed Mousa
WSB University, Dabrowa Gornicza, Poland

## Synonyms

Affective commitment; Continuance commitment; Normative commitment; Organizational commitment

## Crisp Definitions of the Key Title Words

- Organizational commitment means "the willingness of social actors to invest energy and loyalty in social systems, the attachment of personality systems to social relations which are seen as self-expressive" (Kanter 1868, p. 499).
- Affective commitment refers to an employee's emotional attachment to, integration with, and involvement with his/her organization (Bryant et al. 2007).
- Continuance commitment refers to an employee's perceived costs of leaving his/her organization (Bryant et al. 2007).
- Normative commitment reflects an employee's moral obligation to stay in his/her organization (Bryant et al. 2007).

## Organizational Commitment: History and Trends

Why do corporate managers maintain emotional bonds toward their workplaces while university professors do not? This question was the cause for significant societal debate in the United States in the late 1960s. Moreover, this question entailed a direction and orientation for the development of organizational commitment theory. Gouldner (1958) is perceived to be the first to address organizational commitment through introducing and then distinguishing between cosmopolitans, employees who work hard but maintain low levels of loyalty toward their organization and locals, and employees who maintain high levels of loyalty toward their organization but tend to do the minimum when fulfilling their job roles. However, Gouldner (1958) did not develop a description of employees who maintain a high level of loyalty to their organization and do their best in fulfilling their job duties.

Etzioni (1961) was the second to attempt to address organizational commitment despite his tendency to use the concept of involvement instead of commitment. This author classified involvement into the following three types. *Moral involvement*, which reflects the emotional feelings of employees toward their workplace, which usually arise from their belief in their organization's values. *Calculative involvement*, which reflects employees' efforts to maintain a relational connection with their organization because of the salaries and benefits they get in return. *Alignative involvement*, which reflects employees' negative attitudes toward their organization. This third type has later been labeled as *organizational cynicism*.

Based on the preceding, some definitions for the concept organizational commitment have emerged. Kanter (1868, p. 499) defines it as "the willingness of social actors to give their energy and loyalty to social systems, the attachment of personality systems to social relations which are seen as self- expressive," while Grusky (1966, p. 489) considers it as "the nature of the relationship of the member to the system as a whole." However, the most common definition for organizational commitment has been developed by Mowday et al. (1979, p. 27) who perceive it as "the relative strength of an individual's identification with, and involvement in, a particular organization." Therefore, committed employees

should have a continuous desire to continue their organizational membership, an unconditional acceptance for their organization's goals, and a readiness to do their best in order to realize their organization's goals (Mowday et al. 1979). Moreover, it was clear that research on organizational commitment has started in North America before extending to academic centers and research institutes in the world's different regions. Furthermore, the majority if not all of the research on organizational commitment – particularly those studies conducted before 2000 – does not pay much attention to new practices in the work environment and phenomena, such as the dependence on contingency workforce, working from home, and even digital/virtual work modes.

The early research on organizational commitment focused on measuring the level of affective attachment from employee to employer (Becker 1960). This is why Porter et al. (1974) define organizational commitment as "an attachment to the organization, characterized by an intention to remain in it; an identification with the values and goals of the organization; and a willingness to exert extra effort on its behalf" (p. 604). Moreover, a tridimensional classification of organizational commitment was introduced in 1990, whereby Allen and Meyer (1990) classified organizational commitment into affective, continuance, and normative approaches. Affective commitment refers to an employee's emotional attachment to, integration with, and involvement with his/her organization (Bryant et al. 2007). Continuance commitment refers to an employee's perceived costs of leaving his/her organization (Bryant et al. 2007). Becker (1960) indicates that employees invest time, effort, health, money, and so on in their organizations. Such investments strongly affect their decisions and/or intentions to leave or remain in their organizations. Normative commitment reflects an employee's moral obligation to stay in his/her organization (Bryant et al. 2007).

According to Mousa (2018), the research on organizational commitment can be classified into three categories. The first focuses on measuring the level of emotional attachment an employee maintain toward his/her employer. The second considers organizational commitment as an outcome for four antecedents – job performance, level of absenteeism, turnover intention, and employee citizenship behavior – in any organizational context. The third focuses on discovering the outcomes of maintaining either a high or low level of commitment in work contexts. In all of the previous three categories, researchers tended only to use quantitative methods to yield their research results. This occurred through employing correlation and occasionally also regression analysis. However, it is observable that a qualitative approach has rarely been used in addressing such organizational phenomena. Additionally, Mousa and Puhakka (2019) and Mousa (2018) assert that organizational commitment has only been given considerable space in Western countries and specifically in private sector contexts. It is undeniable that very few researchers from developing nations have addressed the relationship between organizational commitment and employee work behaviors, such as turnover intuition, psychological withdrawal, organizational cynicism, and job satisfaction.

## Organizational Commitment in the Egyptian Public Sector

Up until 2018, it was rare to find any study addressing organizational commitment in either Egyptian public or private contexts despite the significance of this organizational phenomenon and its direct association with employee presenteeism, loyalty, job performance, and citizenship behavior. Researchers and management scholars there have neglected this topic for decades. The first serious attempt to address organizational commitment in the Egyptian context was by Mousa (2018), who mainly focused on answering the question of why teachers leave their positions in Egyptian public primary schools in order to find better employment opportunities in other countries. The impetus for his study was not only to explore an unknown context – the

Egyptian public education sector – but also in using both qualitative and quantitative methods to answer his research questions. Therefore, this study represents one of few studies using qualitative study methods in addressing organizational commitment. Furthermore, the author of this study did not tend to measure the level of affective, continuance and normative commitment among teachers, as the majority of researchers have in previous studies. Moreover, the author did not suggest a set of antecedents that may affect the level of organizational commitment among the teachers in his sample. Instead, he started by conducting a qualitative study in which he used semi-structured interviews to identify the main reasons behind the exodus of teachers from their workplaces.

Upon conducting a number of interviews with teachers in a sample of Egyptian public primary schools, Mousa (2018) highlighted the following five factors as playing a major role in the teachers' level of organizational commitment: workplace spirituality, cultural diversity management, uncertainty management, organizational culture, and organizational cynicism. In other words, the teachers' tendency to stay in their current job and to accept the working conditions in their school depends mostly on feeling that they are doing meaningful work often appreciated by others (workplace spirituality), they are fairly treated regardless of their religion, gender, age, and other demographic characteristics (cultural diversity management), they have plenty of information regarding current and future events the organization faces and accordingly feels secure and safe (uncertainty management), they accept the school's social norms, customs, objectives, tactics, and communication methods (organizational culture), and do not have any negative attitudes toward colleagues, managers, and the working atmosphere (organizational cynicism). In order to gain more in-depth knowledge about the factors affecting organizational commitment in Egyptian primary schools, the same author in collaboration with a coauthor later quantitatively addressed the statistical relationship between each of the five discovered factors on the one hand, and approaches to organizational commitment on the other. For instance, Mousa and Alas (2016a) addressed the relationship between workplace spirituality and organizational commitment, while Mousa and Alas (2016b) focused on exploring the relationship between cultural diversity and organizational commitment through focusing on teachers in Egyptian public business schools.

Mousa and Puhakka (2019) addressed physicians in four Egyptian hospitals and proved that responsible leadership is another important determinant in deciding the level of employee (physicians in this case) organizational commitment. According to this study, it is not only about the employees' sense of meaningful work, justice, involvement, safety, and good relations with colleagues but also their leaders' orientation to create, develop, export, and disseminate the virtues of wisdom, transparency, and respect among in-and-out groups. The organization's stakeholders play a vital role in shaping employee's emotional attachment to the employer, the tendency to stay in his or her current position, and the intention to do his or her best to fulfill planned objectives. It is worth highlighting that the idea behind developing and internalizing responsible leadership as a new leadership style relies largely on building long-lasting trusting, ethical, and social relational interactions among employers (or managers) and their surrounding stakeholders (including employees) (Mousa 2018; Mousa et al. 2019). This has stimulated Mousa and Puhakka (2019) to consider responsible leadership as a new factor affecting employee organizational commitment.

## Conclusion

This entry starts by elaborating the emergence and development of the concept of organizational commitment. Moving forward by focusing on previous attempts to define this concept, the author explores how the research on organizational commitment has been dealt with over the past four decades. Upon focusing on the Egyptian public sector context, the author illustrates the main factor deciding the level of organizational commitment among employees based on previously published studies addressing this context.

# Organizational Communications

Saleem Gul
Institute of Management Sciences, Peshawar, Pakistan

## Synonyms

Communication barriers; Communication models

## Introduction

This chapter provides a brief overview of organizational communications. The chapter is structured such that the first section clarifies the definition and purpose of organizational communication. Then the discussion focuses on the different types of communication. This is followed by an overview of the patterns of communication and then focuses on the barriers to communication followed by the models of communication. The chapter considers the issue of miscommunication in cultural exchanges and concludes with a discussion relating communication to the process of negotiation.

## Defining Communication and the Purpose of Communication

Organizational communication is an essential element of any organization. To understand organizational communication, we must first develop an understanding of the organization itself. An organization in the classical definition provided by Robert Coase (1937) is an entity that seeks to "maximize shareholder's wealth." Later definitions of an organization can be categorized into four schools of thought: the general, the economic, organizational behavior, and organizational psychology. Each defines an organization slightly differently because of its underlying ontological world view. Regardless of which perspective is taken in defining an organization, there are certain similarities, i.e., organizations are comprised of a collection of people, who work toward a defined goal, within an environment that allows them to work efficiently, and generate a surplus (be it of value, money, product, market share, etc.). Others have taken a more normative view and see organizations as an amalgam of three things: the structure, the goal, and the people (Wrench 2013).

Organizational communication arises in "social collectives in which people develop ritualized patterns of interactions to coordinate their activities and efforts in the ongoing accomplishment of personal and group goals" (Kreps 1986). Organizational communication is the building

block of collectives that use communication to formulate their goals, keep track of their progress, and solve their problems. This happens to be a purely introspective of view of communication. Conversely, various organizational members interact with the outside environment. Organizations with open boundaries interact more freely and are more likely to adapt to change. Organizations with closed boundaries tend to insulate themselves from the environment and are less likely to be aware of developments in the general environment. Openly bounded organizations receive input from the environment in the form of material, manpower, finances, and information.

## Types of Communication

All communication that exists in an organizational setting can be divided into two categories, external and internal communications. External communication concerns the communication that an organization has with its customers, clients, public, concerned government agencies, and the like. Internal communication occurs within an organization and uses either the formal channel or the informal channel for its purpose. The flow of information within the formal channel may be upward, downward, horizontal, or diagonal. The informal channel relies solely on the grapevine (Johnson et al. 1994).

External communication is used by organizations to maintain external relationships with stockholders, suppliers, and government agencies. Internal communication is an essential feature of an organization's administrative structure. Contemporary literature suggests that the human resource department plays an important role in maintaining internal communication. Internal communication is used for disseminating information within an organization, for communicating goals and objectives, for motivation or reprimands, etc. It is important that internal communication remains inclusive and honest.

The direction of communication in autocratic organizations tends to be unidirectional (Mahmood et al. 2012). However, in modern organizations such communication is useful solely for sharing information. Downward communication implies a downward flow of information from the top of the organization toward its bottom. Such communication not only recognizes the hierarchical structure of the organization but also acknowledges the assumption that those in positions of power can direct others to do their bidding. Downward communication is strongly complemented by upward communication, without which it is nothing but a renaming of unidirectional communication. Upward communication is maintained from the lower-level employees of an organization toward the higher-ups. This type of communication provides a channel for employees to share their opinions, suggestions, complaints, and redress their grievances. Although upward communication has its benefits, it may create ego problems to those in higher positions or it may be used for needless criticism of policies by disgruntled employees.

Horizontal or lateral communication involves interactions among peer groups or between departments. This type of communication is used for problem solving, idea sharing, and other mundane exchanges involving functional activities. Diagonal communication is a combination of the upward, downward, and horizontal communications. It motivates employees and creates a sense of belonging and involvement within the employees. Care needs to be exercised so that such communication remains relevant and does not degenerate to a useless crisscrossing of information within the organization.

Organizations are structured in many ways, primarily tall hierarchies or flat hierarchies. Communication is more difficult in taller hierarchical structures. Typically, organizational life is rife with communications flowing through two different media, i.e., the formal and the informal (Lammers and Barbour 2006). Formal communication within organizations tends to be deliberate and slow. Informal communication is quick and up-to-date. Both formal and informal communications may take the form of verbal and written modes for their purpose. Internal informal communication within large organizations where pockets of people work closely together may give rise to grapevines, unofficial or informal channels of communication beyond the control of the organization.

There are four types of the grapevine: single-strand chain, gossip chain, probability chain, and cluster chain (Burke and Wise 2003). In the single-strand chain information moves linearly and slowly from one person to another. In the gossip chain, an individual goes around communicating the message or information that she/he possesses and considers important enough to share with a few chosen others. The probability chain is like the gossip chain but differs in that the message is shared indiscriminately within the organization. Generally, the message passed through the probability chain may be interesting but not important. Finally, the cluster chain involves one person sharing information with their peer group and then the same information being relayed to another group by one or a few members of the first group.

Grapevine communication is beneficial in that it fosters the formation of strong bonds between peers and provides a channel to vent and share frustrations thereby reducing emotional outbursts and reactions. It is fast and supplements formal channels; it provides informal feedback on the changes contemplated by management. Alternatively, the grapevine if left to grow unchecked could prove detrimental to the health of an organization. Out of control grapevines tend to exaggerate or distort content and spread gossip unnecessarily. Additionally, these can be used for character assassinations or vilification of individuals. It is important to note that grapevines cannot be eliminated but may be moderated.

## Patterns of Communication

There are some common patterns of communication that are popular in mainstream communication studies, including the circle, chain, Y, and wheel (Leavitt 1951):

(a) Circle pattern: The circle pattern consists of a sender who is the group leader. The sender gives a message to the group member adjacent to them who in turn forwards the message to the next group member and so on. No group member can receive the sender's message directly except for those adjacent to him or her. In a circle pattern the communication travels to each member of the group but takes time. As the pattern is a closed-loop, the sender can determine if the last member received the information.
(b) Chain pattern: The chain pattern is like the circle pattern except that it does not loop. This implies that the sender can send the message but has no way to verify if the last member has received the information.
(c) The "Y" pattern: The Y pattern is a combination of chain patterns such that a central leader controls the three prongs of the Y shape. Each of the three groups can communicate with each other only through the leader. Thus, communication under the Y pattern is more complicated than the circle and chain pattern.
(d) Wheel pattern: The wheel pattern is a combination pattern, consisting of a mix of the circle and the Y. In this pattern, the leader remains at the center of the wheel, while the members exist on the spokes. The wheel is a superior pattern as each member can talk directly to the leader. However, the disadvantage is that not all members can speak to each other. That is, only those members that are nearby to each other can share messages. It could be argued that the members on the spokes of the wheel are like a circular chain minus the leader.

## Barriers to Communication

Barriers to communication identify factors that interrupt the free flow of information being exchanged between parties and the reciprocal feedback that arises as its consequence. Failed communication results in misunderstanding, irrelevant responses, and undesirable reactions. These result in the loss of time, resources, and material. Barriers to communication range from the simple distraction to more complicated psychological factors. The consequences range from a simple communication gap to a complete breakdown of communication. It is easier to repair a communication gap but difficult to recover from a communication breakdown.

Literature has identified several barriers to communication, including physical environmental barriers, barriers of medium, semantic barriers, cultural barriers, psychological or attitudinal barriers, and barriers caused by varying perceptions of reality (Eisenberg 2010):

(a) Physical Environmental Barriers: These are caused by several factors, such as time, space, place, and medium. Time can be a barrier when a slower channel of communication is selected in relation to the time available. Space becomes a barrier when the communicating parties remain at a physically inappropriate distance than what is required by the situation. Place is a barrier when an inappropriate venue is selected. Places that should be avoided to foster better communication are those that are overcrowded, ill-lit, ill-ventilated, insecure, etc. Medium refers to the choice of method used for communication. Choosing the wrong medium in each situation may violate the norm and further contribute to time delays in a communication.
(b) Semantic Barriers: These refer to the different meanings associated with a word or differences in the vocabulary used by the communicating parties. Semantic barriers may also exist because of the limited vocabulary used by one party.
(c) Cultural Barriers: These arise because of the existence of cultural diversity and new norms. Things that may be appropriate to say or do in one culture may turn out to be unacceptable in another. This may lead one party to take offense and limit the effectiveness of communication.
(d) Psychological or Attitudinal Barriers: These refer to the barriers to communication arising from the psychological condition of the parties involved or the attitude they hold toward each other.
(e) Perception of Reality Barriers: These are the barriers that arise because of the varied levels of understanding and perception of an issue by the parties involved in a communication event (Ibid.).

## Models of Communication

There are several models of communication used to understand the communications process. This section will briefly discuss some of the more prevalent models in organizational communications literature:

(a) Fisher's Model (Fisher and Ellis 1980): Builds on the decision-making model of John Dewey. Fisher observed that group interactions change variously as groups move toward forming decisions. Fisher's model captures the stages that interacting partners go through while engaged in a decision process. These include orientation, conflict, emergence, and reinforcement.
(b) Poole's Model (Poole and Baldwin 1996): Is a descriptive system for studying multiple contingency variables and consists of 36 clusters for coding group communications and four cluster sets such as proposal growth, conflict, socio-emotional interests, and expression of uncertainty. Pool argued that it is difficult to predict the stages during a communication; thus he puts forward four tracks that may be used to interpret the communication style used during an interaction. The four tracks include task track, relation track, topic track, and break points.
(c) Tubbs' Model (Tubbs 1995): Is based on four stages that a group undergoes when reaching a decision. These are: orientation, conflict, consensus, and closure.
(d) De Fleur's Model (De Fleur and Larsen 1958): De Fleur's model of communication is an expanded version of the Shannon and Weaver model, which he combines with Westley and Maclean's model. Shannon and Weaver's model is a one-way communication model that explains the role of noise in a communication process. De Fleur extends Shannon and Weaver's model by adding the element of mass media. Westley and Maclean's model is a two-way model that introduces the element of linear feedback. De Fleur combines both these models to develop a model of a mass communication system.

## Miscommunication in Cultural Exchanges

Culture is at the heart of all human interactions. Cultural dynamics includes shared meanings, norms, values, attitudes, and beliefs. These formulate a shared system of making sense of the world around us and allow us to pass our understanding of the world to succeeding generations. Cultural groups share some form of identity; this may include religion, race, geographic origins, ethnicity, etc. Culture also influences the way we speak and behave, both of which affect organizational communications. Literature on organizational culture agrees that cross-cultural communications is more difficult than communications that arise within a single culture.

Barna (1998) identifies six sources of miscommunication in cross-cultural exchanges:

(a) Assumptions of similarities: Refers to the tendency to view our own actions as universally accepted rules of behavior. Anyone who acts differently is thought of negatively.
(b) Language differences: Refers to the miscommunications that arise because of different languages being spoken by the parties involved. At times the same language may give rise to issues as the contextual meaning of words may differ from region to region.
(c) Nonverbal misinterpretations: Refers to our way of dress, use of space, orientation toward time, way to making physical contact, eye contact, etc. and how that influences the way a communications process progresses.
(d) Preconceptions and stereotypes: Refers to the preconceived ideas that we hold about other cultural groups. Communications would be different depending on the nature of the stereotype we hold about the group.
(e) Tendency to evaluate: Refers to our tendency to evaluate others behavior from our own cultural vantage point.
(f) High anxiety: Refers to a heightened sense of anxiety experienced during an interaction between members of different cultures. This is often caused by a heightened need to not cause offense during a conversation or interaction.

## Communication and Negotiations

Organizational communication often includes an element of negotiation. A key concern during a negotiation is the idea of "saving face." This includes saving the face of self and a concern for saving the face of the other. People from different cultures hold different concerns during a negotiation. Those belonging to a collectivist culture tend to avoid or integrate conflict. Those from individualistic cultures tend to dominate during negotiations. Another factor in negotiation is societal status, which gives rise to power. Members of collectivist cultures are born into certain status quo, and therefore their individuality is not a concern during the negotiation process. Those belonging to individualistic cultures hold their individuality more dearly.

Members of collectivist cultures maintain face for the sake of society, while members of individualistic cultures save face to preserve or maintain one's own face. These dimensions give rise to five types of conflict styles (Rahim 1983): dominating, avoiding, obliging, compromising, and integrating:

(a) Domination: is an individualistic approach to making decision by dominating or controlling
(b) Avoiding: a collectivist approach of staying away from the conflict
(c) Obliging: a collectivist approach of giving up
(d) Compromising: an individualistic approach to negotiate to come to an agreement
(e) Integrating: an individualistic approach to work together to read an agreement

## Conclusion

This chapter presents a short introduction to communication and the various issues associated with it at the level of an organization. It demonstrates the multitude of factors that influence both the sending and receiving of information.

# Organizational Control

Louise Briand
Center for Research on Social Innovations (crises.uqam.ca), Université du Québec en Outaouais, Gatineau, QC, Canada

## Synonyms

Management control

## Definition

Organizational control refers to processes by which agents are able to establish and maintain control over an organization. It comprises the strategic planning process as well as methods and devices that make other agents' behaviors consistent with objectives.

Historically, managers have been considered to be the trustees of organizational control. However, in this paper, it is argued that managers are not alone in the quest for control (Child 2005; Deetz 1992) and that organizational control is both a source of power and of power struggles in contemporary organizations.

Consequently, it is argued that organizational control is a social construction and that it is best defined in the following terms: a set of practices of integration that regulates social activities (human work) in a social system (organization) that it is both the process and the result of elements that support and constrain its constitution (Briand 2001, 2004).

## Introduction

This paper presents the origins and substance of organizational control in large American organizations. It is structured as follows: the rise of organizational control, its limits and attempts to renew it, and to conclude a proposal for its reconceptualization.

## The Rise of Organizational Control

Organizational control was born from the need to apprehend complexity (Kaplan 1984; Chandler 1977). Its ability to organize space and time through indirect supervision provided the potential for its development. In addition, organizational control has helped to create effective routines to deal repeatedly with a changing world (Coriat and Weinstein 1995) by its capability to organize time through standard costs, accounting cycle, budget cycle, etc. (Kaplan 1984).

Organizational control refers to the "fact for leaders to master the organization they manage and it is achieved by orienting the actions of those to whom they delegate autonomy and the responsibility of directing staff" (free translation, Bouquin 1994). Organizational control is a permanent activity that acts before, during, and after the action. It is made up of processes, devices, and information systems which guide the actions and behaviors in order to make them consistent with long- and medium-term objectives. Its purpose is to organize resources, to identify the sources, and to measure an organization's performance (Bouquin 1994).

It is Robert N. Anthony who is credited for the conceptualization of organizational control that resulted from the economic development movement of organizations: a development to which organizational control has contributed (Bouquin 1994).

For Anthony (1965, 1988), an organization is a group of people working on one or a few goals regardless of the organization's orientation (profit oriented or nonprofit oriented). When the material, financial, and energy resources are combined with human labor, the organization is an "economic enterprise," and organizational control becomes a steering, coordination, and monitoring system that ensures the smooth integration of all the organization's resources.

Anthony's general framework is made up of three essential elements: (1) the notion that objectives or goals are decided, (2) the idea that human implements activities to achieve the goals, and (3), ultimately, that to achieve goals people must work together.

Accordingly, organizational control consists of:

1. Nonsystematic activities of strategic planning to define goals. These activities are performed by leaders able to measure the threats and to seize the opportunities of the external environment.
2. Systematic coordination and monitoring activities, to help leaders decide decision which activities to implement, to help communicate strategies and tasks, to ensure optimal combination "task/person," to motivate people, and to assess the individual and collective performance to take corrective action as necessary.

Organizational control is based on a hierarchical structure, composed of responsibility centers (profit, cost, revenue, or investment centers), which help leaders allocate the resources for each activities; it also relies on a centralized and unified accounting system which supports the leaders in their coordination and monitoring activities.

Organizational control as defined by Anthony is a process in which leaders determine goals and objectives, middle managers are professionals who can make decisions related to their fields of expertise, while staff carries out activities to achieve the goals. An organization, according to this perspective, presupposes a stable definition of the roles and responsibilities of all agents, as well as a structure and management practices to ensure the integration of individual activities in an orderly and conflict-free collective action.

Organizational control illustrates the managerial takeover over the organization, and it signals the expansion of the accounting sphere over social relations. It reveals the emergence of a "social order project" based on neoclassic economic theory, scientific management (Taylor 1912), normative principles of administration (Fayol 1917), and "attention-directing," "scorekeeping," and "problem-solving" operating modes (Burchell et al. 1980).

Although organizational control appears to be highly technical and instrumental at first glance, it is in fact a rather sociological endeavor because it aims at controlling behaviors (Malo and Mathé 1998): "In the broad sense control has the purpose of conforming behavior of some person or thing to a desired state of affairs" (Anthony 1988).

## The Limits of Organizational Control

Born with the need to manage complexity, organizational control has faced many limits in the last decades as put by sociologists and organizational

theorists: the indeterminacy of human conduct (Crozier and Friedberg 1977; March 1991; Friedberg 1993), the politicization of the decision process (Mintzberg et al. 1976; March 1991), the weakening of formal rationality in favor of multiple rationalities (Sfez 1984), the complexification of behaviors in a context of collective action (Olson 1978; Reynaud 1989), the multiplication of modes of regulation of human activity (Friedberg 1993; Thévenot 1993), and the historicity and the permeability of structures (Morin 1986).

In addition, the contemporary business environment has become unstable, hostile, complex, and diverse. The environment is nowadays said to call for processes of control that gives more power and trust to the middle managers and workers (Malo and Mathé 1998). Moreover, the rise of an economic and industrial system that focuses on the production and utilization of information – the "knowledge economy" (Castells 2001) – requires that organizations rely on the autonomy and judgment of their employees.

Traditional organizational control systems have become inadequate and irrelevant (Alvesson 2004). The foundations of organizational control are challenged, while the accounting-based control processes that standardize and normalize are deemed inadequate to support strategic direction and decision-making, management of resources, and ongoing adaptation of organizations.

## Renewing Control

It is in this context that the need for new forms of control has emerged (Nixon and Burns 2005) and that organizational control has migrated to the realm of values, beliefs, and identities (Alvesson 1993; Casey 1999; Alvesson and Robertson 2006). What comes to mind in particular are Simons' (1994, 1995) "belief systems," "boundary systems," and "interactive control systems" that compensate for the insufficiencies of diagnosis control systems in reconciling workers' need for autonomy and the control requirements of the dominant actors. Other examples are:

1. "Intangible controls" to manage "trust, loyalty, and commitment." Specifically, corporate codes (codes of ethics, codes of conduct, and codes of practice, Clarkson and Deck 1993) all express a specific approach to control of behaviors: codes of ethics clarify the organization's moral values and rely on self-control, codes of conduct provide a list of mandatory rules and prohibitions and are based on imposed control, and codes of practice refer to organization's values in generally accepted behaviors, and they are based on a hybrid control formula distinguished by an "act and disclose" approach ("use your best judgment but let us know what you are doing") as well as by a "seek advice" approach ("seek approval before acting"). A study of the content of corporate codes reveals that organizations usually borrow from these three code forms (SCMAC 1997).
2. Neo-bureaucratic project management methodologies in team-based organizations (Briand and Hodgson 2015; Hodgson and Briand 2013).
3. Interorganizational modes of control to overcome firm boundaries in network and value-chain settings (Araujo et al. 2003; Marchington and Vincent 2004).

In a general sense, all of these innovations signal an effort to renew control without, however, breaking away from normative control.

## Conclusion: Reconceptualizing Organizational Control

The content and forms and organizational control processes depend on their ability to ensure integration and it is this ability – or lack of it – that explains organizational control reproduction or transmutation. For this reason, it is suggested that the analysis of organizational control must take new paths.

It is suggested that in late modernity (Giddens 1990), organizational control has to deal with the "reflexivity" and "the opening of the future." Therefore, the possibilities to create "order" in

any organization are limited. In fact, 'order' in any organization appears to be a project that inherited an instrumental sociology that obscures the relationship between knowledge and human subjects and the relationship that humans have with each other (Giddens 1984). In the light of the work of Yates (1997) and MacIntosh and Scapens (1990, 1991), it is suggested that organizational control should be conceived as an "undecided," although not random, phenomenon; as a set of practices of integration that regulates social activities (human work) in a social system (organization), organizational control becomes both the process and the result of elements that support and constrain its constitution (Briand 2001, 2004).

# Organizational Culture and Management Styles in Nonprofit Organizations

Hatem H. Alsaqqa
Healthcare organizations management, Ankara, Turkey
Ministry of Health, Gaza City, Palestine

## Synonyms

Leadership: manager; Management: supervision, organization; Nonprofit: non-benefit; Organization: group; Style: form, type, character

## Definitions

***Organizational culture***: is the individual's actions of the organization and the meanings of its operations. Culture encompasses the principles, visions, symbols, views, and also thoughts and feelings. As a means of identifying, it is also the outline of those collective habits and expectations that are meant to guide organizational members.

***Management style***: is distinctive ways to make decisions and to appeal to employees. It can be classified into two major contrasting types and is also divided into separate styles in the broad sections.

***Nonprofit organization***: is an agency that uses excessive returns rather than distributing them as benefits or incentives to accomplish its objectives. While nonprofit organization is allowed to produce monetary gains, the organization must preserve them for its self-preservation, growth, or projects.

## Introduction

The core values that most organizational staff share is the cornerstone of every organization, and these values guide its appropriate behavior, decision-making, and performance. For leaders looking to produce strategic results, an appreciation of the corporate culture is a critical ability. Strategic leaders have a vision of where they get with the organization, so that would mean probing the culture's dynamics in view of what needs to be improved and what might maintain.

In an efficient organization, by team building, the leader empowers employees. This will ensure consistent actions among the organization's members, minimize tensions, and create a safe work atmosphere for employees. An organization's core principles start firstly with its leadership, which then evolves to a style of management. There will be a strong collective behavior of ideologies and beliefs and a strong culture will then emerge (Tsai 2011). Organizations are complex like individuals; each has a style, strengths, and limitations.

Nonprofit organizations are founded by civil society and depend on staff work to alleviate the social issues created by shortage. Nonprofit

management style plays a major role in the organization's growth, empowering and encouraging others to act as drivers of social change, where the engagement of society focused on solidarity. By impacting various sectors of society, these organizations play an important role in reducing social inequality, improving education and access to food, and emphasizing safety. Nonprofit organization leaders usually face a greater need to respond to new economic means and foster team spirit, feeling of belonging, inspiration, encouragement, and staff integration. The benefit is that nonprofit culture can grant the staff a motivating sense of purpose. The better the culture, the greater the potential for nonprofit behavior to positively power the community.

## The Concepts and Types of Organizational Culture

Culture has been extensively studied in the evaluation of a person's social beliefs, symbols, values, language, actions, rituals, and norms (Scott et al. 2003). There are various organizational culture concepts, but generally they contain the following components:

**Rules**: These are the guiding principles that every newcomer needs to abide with to be part of the organization.

**Philosophy**: The organizational principles of policies, such as how to treat clients or workers and mission statement.

**Dominant ideals**: The standards that an organization embraces and wishes its staff to act in a certain way.

**Norms**: The essential rules of ethics that the organization acknowledges is this. A measurable evaluation of what is allowed or prohibited.

**Observed behavioral regularities**: The use of a basic language, systems, rituals, and terminology communicates with consideration and behavior by organizational members.

**Climate**: The general atmosphere reflected by the organization, such as the physical layout and the interaction of members with consumers and/or outsiders. They are merely illustrative of the organization's existence (Xhelili 2016).

One technique to study organizational culture is through the competing values framework. The dimensions were suggested to represent competing core values (Cameron and Quinn 2011). The competing values framework posits that organizations experience competing demands and tensions along two key dimensions: flexibility vs. stability and control and internal maintenance vs. external competitive aligning. These two dimensions have two-axis cross sections, generating four sets of principles aligned with one of four forms of organizational cultures: clan, adhocracy, hierarchy, and market. The dominant culture is called healthy when no dominant culture appears. Each of the four forms of culture has a cluster of features that reflect the ideals of the organization that are shared with employees.

The four core principles are special since they embody opposite or competing principles. The dimensions and quadrants are very effective in describing the different orientations and conflicting principles that characterize the behavior of humans. The strength of these dimensions and the richness of the quadrants seen to be fit in being identified as cultural types that represented as the diagnosis typologies.

*The Hierarchy Culture:* a formalized, structured workspace characterizes the organizational cultural compatibility with this form. What people do is regulated by procedures to maintain a smooth association. Strong coordinators and managers are effective leaders. Constancy, aspirations, and effectiveness are the organization's long-term issues.

*The Market Culture:* is a workplace that concentrates on outcomes. Leading producers and competitors are hard driving and then they are rugged. The adhesive that grasps the organization parts emphasizes the performance. The long-term prominence is on strategic initiatives and the achievement of long-term purposes. Profitability and stimulation are defined as accomplishment. It is crucial to resolve competition and market leadership.

Cameron and Quinn culture model (based on Cameron and Quinn 2011)

Source: Kaminskaya (2017)

*The Clan Culture:* is characterized by a sociable place where people share a great deal of their life. It is like a larger family as leaders are considered mentors. Loyalty and tradition unite the organization. The obligation is high where the company stresses the long-term value of human growth with great unity and morality. In terms of internal environment and human interest, success is established. Teamwork and agreement are given a priority by the organization.

*The Adhocracy Culture:* is marked by diverse, entrepreneurial work. People are projected their necks and taking chances where good leadership is innovative, imaginative, and risk-based. The glue that supports the organization's components is an incentive to practice and creativity, so the emphasis is to be at the forefront of the latest knowledge and services. The organization's enduring focus is on sustainable expansion and new properties. Success proposes that there are disparate original services.

## Why We Need the Culture for Nonprofit Organizations?

In nonprofit organizations, organizational culture plays a vital role since their members usually demonstrate sincere interest in the cause for which they serve. The coincidence of values and beliefs among nonprofit organization staff members is an important prerequisite for a successful dedication for the success of highly competent groups. Specific attributes of a nonprofit organization result from active participation and clear connection to values: lack of pressure on the financial result (organizations work to meet social needs not to make profit), jobs of volunteer staff rendering services in the interest of the society.

By questioning, listening, reading, and feeling, cultural knowledge can be gathered within an organization. Four roles are fulfilled by corporate culture. Firstly, organizational culture proposes an organizational identity to its staff. Secondly,

mutual engagement is encouraged by organizational culture. In other words, the culture of an organization should create an atmosphere that allows staff to be committed to the overall purpose. Thirdly, it facilitates the cohesion of the social system, which means that it increases the constructive and reinforcing view of the community by staff and efficiently handles conflict and transition. Emphasizing performance-based awards and praising results, for example, is a successful strategy for reducing turnover of workers. Fourthly, by helping participants make sense of their settings, organizational culture influences staff's actions.

The advantage is that the culture of nonprofit will offer a motivational feeling of mission to employees. The greater the culture, the greater the nonprofit's ability to have a positive effect on the world. The principles of nonprofit will be well and correspond with the actions taken on a day-to-day basis by appropriate leadership management style and staff. Core values can contribute to the way resources are spent within the organization, the work-life balance philosophy of the organization, and how performance can be designed. During decision-making procedures, leaders have to integrate core principles to ensure that whole team stays committed to these values. The mission statement serves as a roadmap to help make chief choices for the organization's staff.

## Management of Nonprofit Organizations

The value of nonprofit organizations is remarkable because they help to meet the needs of society in numerous fields, including poverty, development, and health among others. The leadership of those who manage nonprofit organizations is reflected in their creation, development, survival, and their longevity, as well as in the impact on their staff and culture.

Managers encourage and administer both economic and social actions within organizations. In this context, Kaplan (2001) discusses the need for organizational managers who have updated performance indicators and describes that clarity in transparency is required by donors, foundations, or other actors providing their funding. Managers help preserve social cohesion and establish new social balances and act as a "social valve," and to operate this form of institution, funding and volunteers are required. Therefore, a proficient management style of supervision, controlling, and sustaining in such organizations is needed.

Taliento and Silverman (2005) report in their article that it is more essential to accomplish in the nonprofit sector since (1) the targets are more difficult to attain since they appear to be behavioral and (2) the targets are more difficult to quantify. Dissimilar to the for-profit corporation where the board members decide on increasing the shareholder value with the same goals, nonprofit organizations begin with different set of objectives. It is difficult to quantify performances in nonprofit organizations because they deal with intangible problems such as social change, public perceptions, and behavior that cannot be considered with simple financial estimations. Regardless of what kind of organization it is, contact within the organization is essential. The leadership in the nonprofit organizations is more decentralized, and managers are more proactive because there are less resources organizations and they work with lesser level of certainty.

## How It Can Be Significant to Know Management Style?

A style of management defines the strategies that managers use to handle an individual, event, or organization. Information such as how they coordinate work, the way they make decisions, how they organize, and how they use authority can be included. Since every circumstance is different, they can discover in professional life different management styles. When each style is most successful, they can address some common management styles, and that can allow them to recognize and strengthen their form of organizational culture.

Understanding the natural style of the manager based on his personality, character qualities, and values will help him to recognize the strengths of leadership and areas for development. Another

justification for describing the management style is to help leaders to assess if it is consistent with the current situation of the organization and ultimately determine what style of culture manager wants to lead in. Regardless, it is important to be self-aware of how to be a successful leader and to help him grow in the role.

Moreover, staff control is important to a thriving organizational culture as it affects the consistency of how employees are functioning. As staff upkeep the outcomes of nonprofit organizations, they, too, should feel appreciated. The management should be transparent about the policies of the organization and have strong internal communication methods in order to maintain this feeling. A leader's management style should display that employees' personal development and satisfaction matter to the organization as that eventually leads to improved outputs and loyalty to the organization's mission.

Generating and preserving the organizational culture is a real challenge for management leadership. A good culture includes figuring out what all the nonprofit members want and taking responsibility for ensuring that the needs of those participating in the organization are met. The management style has to establish a forum for the organization to receive constant and open input so that the team feels understood and motivated. Accordingly, the team recognizes the significance of their accomplishments.

## The Management Styles in Nonprofit Organizations

In nonprofit organizations, it can be realized from the increasing importance of these organizations that the managers of these organizations are faced with significantly complicated managerial tasks (Fowler 2013), including scarce resources and ambiguous work environments, suggesting that leaders in nonprofit organizations need to hold the competencies and attributes found in management. Specifically, leaders in these organizations require effective managerial ability, personal integrity, vision, and aspiration to successfully work with their volunteers and employees. There are different management styles mentioned below that can work in nonprofit organizations.

### Authoritarian Management Style

It is often referred to as the style of autocratic or directive behavior. The authoritarian style of management includes controlling through consistent guidance and power. Usually, authoritarian executives claim robust authority, have complete decision-making power, and anticipate unchallenged compliance (Purcell 2019).

Obviously described functions and rigid hierarchies and reporting structures are required for this form of management style. It should not be appropriate for workers to doubt who is responsible for what. The staff need to be prepared and able to remain constantly up-to-date on the work of teams and to make all decisions in order to be a successful authoritarian management style.

An authoritarian management style has been shown to positively impact employee productivity in the proper organizational culture. A traditional culture usually encompasses the strongest environment for authoritarian management style. Such cultures have a high-power range, where staff demand more power from higher-level individuals and prefer to naturally defer to others in higher roles. It may also take a lot of time and resources to retain complete control of all decision-making. This can be extremely hard to do if managers are running big or complicated organizations.

The style of authoritarian management can also be effective, if managers have new or incompetent workers who need a lot of assistance and preparation. It is vital to remember that an authoritarian style can easily construct a destructive environment if taken to the extreme. It can lead to micromanagement if managers try to hold on to power too firmly, which will push away the best staff.

### Visionary Management Style

The visionary style of management is often called inspirational, charismatic, strategic, revolutionary, or authoritative. Visionary managers concentrate on communicating to their team the overall vision of the business, sector, or project. In the daily information, visionary executives do not

engage themselves; instead, they concentrate on the team's morale and cohesion, to maintain everyone going in the same direction and relinquish the specifics of how to get to their team members. This style can be found easy to follow if manager is naturally an enthusiastic and personable leader. However, for introverts or people who are uncomfortable in the spotlight, it may be more difficult. A considerable expanse of emotional intelligence, a risk taking, and the capacity to guide and handle change are also needed.

One of the benefits of visionary management is that it helps inspire staff to work toward mutual goals and solutions. A visionary approach can be useful for bringing everyone back on track if the team culture is currently divided. When a business or team has to change, visionary management is most frequently used. A downside of the visionary style of management is that the lack of courtesy to detail can lead to glitches, especially if the members of the team are inexperienced or fresh. For this drive, for skilled competent teams, visionary management is usually better. People who are already well-informed and confident enough to do their job with little or no supervision.

### Transactional Management Styles

The style of transactional management focuses on the use of beneficial effects to inspire staff to enhance their results, such as promotions, rewards, and stock options. Transactional styles rely on piece-work pay to motivate their workers to produce more. They may similarly arrange quarterly or annual incentives around the performance of employees.

The style of transactional management is built on the idea that through extrinsic incentives, managers can control and inspire staff fruitfully. For short periods, where managers need to impulse team to complete work and they would not need to do, the transactional management style appears to be successful. If managers demand the staff to work longer period to finish a project on time, it might be beneficial to give an extrinsic incentive. Studies show that, particularly in the long run, extrinsic incentives are less fruitful than intrinsic ones. In fact, if used too extensively or for too long, they can negatively affect organizational productivity.

### Servant Leadership Management Style

This style is often coaching or mentoring. The emphasis of a servant management style is to support workers. Managers who follow this style spend their time on coaching, mentoring, and supporting. Instead of a rule enforcer, they see their role as that of an advisor or coach. They need to be highly knowledgeable in both the roles of their staff and in performing coaching in order to be effective managers. In order to connect well with organization's team and develop a mentoring relationship, positive communication skills are required. Managers will need to convince their staff that they are ethical and trustworthy for the team to trust the leaders and open up to them. Usually, this management style often needs some of time because they have to take additional time with meetings with staff in order to mentor and encourage them effectively. If the time is scarce or the efficiency of performance is more critical than employees' satisfaction and well-being, then this style is not suitable.

However, in helping organizational team grow and progress professionally, the servant-leader management approach is useful. It helps to create a strong staff-leader pledge and can foster greater trust, closeness, and collaboration. Servant leadership focuses not on discipline, but on helping individuals learn from experience and on improving their own results. This leadership style can help them reach higher levels of success and efficiency if the organization has a team of talented professionals.

One of the shortcomings of this style of management is that it can be counterproductive for some staff. For negative staff members who are unambitious, pessimistic, and/or just a bad fit for their role, managers may waste their time trying to support and coach them. Managers also build rapport that result is not as high on their priority lists by focusing on learning chances and enhancement, as long as people have made a real attempt at it. Although this can be effective for process enhancement, creativity, and other cyclical projects if the team creates actual goods or offers customer service, also it can create problems.

### Democratic Management Style

A leadership style that is also often denoted to as a style of harmony, participative, or affiliative. This style is based on the idea that two opinions are healthier than one whatever the place or the title everyone deserves to have.

Leaders that follow a democratic style promote the exchange of ideas and daily engagement by employees. The emphasis is on empowering the team to share their opinions, ideas, suggestions, and possible solutions in order to support each other and for the organization's growth. The managers hold the ultimate decision-making authority in a democracy, but before making any decision, they look for and take into account the opinions, ideas, and suggestions of their teams.

The democratic leadership style makes the staff feel appreciated and understood. They can be motivated to address their own issues and come up with interesting new ideas. They are basically empowering the organization members to think for themselves and to take more risks for the organization decisions and results by asking for their feedbacks. They can also arrive at potential ideas and produce greater outcomes by finding out other people's ideas than if they are making decisions in isolation.

The greatest drawback of democratic leadership is that it takes time. If they are in a situation where a decision needs to be taken quickly, they will not have time to seek out the team's ideas to consider them. Another problem is that if staff feel like they are not really taking their ideas into account, workers may become irritated or resentful. For instance, it may result in their feelings being hurt if managers never seem to develop suggestions. To prevent this, without stressing who came up with what, they would need to either encourage anonymous feedback or become adept at initiating conversations and helping their teams concentrate on useful idea development.

### Laissez-Faire Management Style

Employee independence is emphasized by the laissez-faire management style. Laissez-faire originates from French and in English translates directly to "let do." In other words, with less or no involvement, laissez-faire managers enable their staff to do what they want. There is no supervision given during the development or production process under this management style. Laissez-faire managers support self-directed teams and generally only get engaged if something unexpected happens or it is demanded by the team.

A laissez-faire leader would only appear active at the beginning and the end of the workflow circle in a comfortably running team. To provide directives, collect information, and answer questions at the beginning and to review the team's results at the end and provide advice or suggestions on how the team can do better tomorrow (Purcell 2019).

## Conclusion

Management leadership style in nonprofit organizations faces an intricate set of challenges. Managers have to integrate the purpose of the organization into everyday activities, delegate jobs, develop culture, and inspire staff to keep pushing toward their nonprofit targets. However, there is no single best way to lead. Depending on their missions and priorities, nonprofit organizations require different types of management styles. The managers need to decide which leadership style is ideally tailored to the needs of their organizations, if they have been entrusted with leading or facilitating a nonprofit managerial style for their nonprofit organization. Today, organizations are looking at six kinds of nonprofit management leadership styles and debating how to determine which nonprofit values demand. Furthermore, leaders who default to one management style without challenging their strategies are generally less effective, thus simply asking the question, "How can we improve?" Also, there will be less than desired outcomes in a management style that is inconsistent with the entity, task, or situation at hand.

For an entrepreneurial firm, there is no full right culture type. Some modes of action are encouraged by all cultures and hindered by others. Others are well-suited to rapid and repeated transition, and others to slow the institution's gradual growth. The best culture would be one that closely suits a specific organization's strategy as it faces its own problems and the challenges of an unordinary period. The next progression in

enhancing the management style may be to evaluate and compare the management leadership styles with their personal and team needs and their current abilities, experiences, and skills. Managers need to have the tools to accommodate those requirements, consider ways to close skills gap, identify achievements, and periodically improve quality of life. In order to build their skills set, managers can also ask for critical suggestions from direct reports, peers, or more senior consultants and suggestions for extra management training. Ultimately, best nonprofit organizations will typically retain flexibility, awareness, and the willingness to master various styles of management.

In order to summarize the assumptions presented here, it can be discerned that nonprofit organizations are mainly oriented toward collective equality and tolerance of high uncertainty. Values are geared to the mission pursuit shared by all and carried out through teams of co-workers. The participatory management style is dominated by the democratic nature of staff relations, where organizations are characterized by a low level of classicism and informal and decentralized communication. In this style, there is an orientation toward change. Strategy is responsive with a prevalent focus on taking up opportunities for growth as they arise. The nonprofit organizational culture profile is consistent with some mentioned management styles, referred to as the dynamic community. The presented organizational culture types and management styles need deeper verification as well as reflection in the sense of nonprofit organizations' operations and connections between structure and culture of achieving targets. Fortunately, almost every form of personality and every type of organization has a professional leadership style to fit. Leaders need to find a management style consistent with both their attitude and their organization values to lead more effectively.

# Organizational Culture and Socialization

Michael Klausner
Social/Behaviorial Sciences, University of Pittsburgh at Bradford, Bradford, PA, USA

## Introduction

The concept of culture is ubiquitous in all of the social sciences and is of paramount importance. It is most discussed, however, in anthropological and sociological analysis of societies and social behavior where it refers to an interrelated set of values, beliefs, assumptions, traditions, and

practices that exist within a society. It also includes the accumulated corpus of knowledge in all areas that exist in a society. Used in this way, the focus is on the macro-level of analysis, whole societies. The notion of culture, however, is equally applicable to social structures couched at the meso or middle-range level such as organizations. All organizations have a distinct culture. An organization's culture consists of its values, beliefs, expectations, philosophy, and notions of appropriate ways of interacting with its members, as well as key stakeholders which are outside of the organization such as customers, vendors, and other organizations. One can think of an organization's culture as providing a blueprint for its members' behaviors.

The importance of an organization's culture cannot be overemphasized but sometimes is, given that most aspects of culture are quite intangible and abstract even though its *manifestations* are not. The major topics discussed in this chapter are as follows:

> 1. The key elements of organizational culture. 2. Sources of an organization's culture 3. The variety of ways it is made visible and conveyed to members of the organization. 4. The extent to which an organization's culture is "strong or weak" and the consequences of such. 5. Organizational subcultures. 6. Ways in which organizations socialize new members into its culture. 7. How organizational culture relates to start-ups compared to mature organizations.

## Sources of an Organization's Culture

A start-up's organizational culture, unlike that of a mature organization, does not initially have an existing, relatively stable culture in place. In such instances, the founder of the company will be the major, sometimes the only source of the culture. This is especially likely to be the case if the founder has an already existing philosophy of management and values either acquired from previous organizations or derived from his/her personal philosophy and personality. As Flood notes, "When an entrepreneur builds a business, it is typically, 'their baby' and will acquire many of the values, and characteristics of the builder" (Flood 2021).

A good example of a start-up that had a strong culture which reflected its founder's personal organizational philosophy is Zappos, a company that sells shoes online that was acquired by Amazon. Its founder Tony Hsieh developed a corporate culture consisting of the following core values:

> 1. Deliver wow through service. 2. Embrace and drive change. 3. Create fun and a little weirdness. 4. Be adventurous, open-minded and creative. 5. Pursue growth and learning. 6 Build open and honest relationships and communication. 7. Build a positive team and family spirit. 8. Do more with less. 9. Be passionate and determined. 10. Be humble (Scandura 2019).

Founders of such iconic companies as Sears Roebuck, J.C. Penny, Walmart, and Apple developed strong organizational cultures that were very instrumental in those company's outstanding success. The success of these companies continued long after their founders passed on. Reed Hastings, founder of Netflix, during an interview with venture capitalist John Doerr said, "If the cultural roots are strong, then new leadership is developed in that model and will often continue the culture" (Roz 2020).

Initially, an organization's culture may be strong but as the company begins to grow it becomes weak because the founder becomes obsessed with doing everything him/herself and not delegating authority and tasks to others. While at first it may be necessary for the founder to be a "jack of all trades," as the company develops, being such may cause him/her to lose sight of the larger picture and not to reinforce the company's culture. On the other hand, if the organization's culture continues to maintain its strength by being shared among its members and reinforced, members will expect and welcome additional responsibilities. Reed Hastings, cofounder of Netflix, developed a "culture deck" consisting of 130 power point slides which initially was used internally to socialize new members into the company's culture but now is also used as a recruiting and vetting out potential employee tool. He said he "aspires to go entire quarters without making a single decision" (Roz 2020). Hastings' point is echoed by Tristan Walker, founder of Walker & Company which

developed shaving solutions for men of color. When asked by Guy Raz what he wished he knew 15 years earlier that he knows now, his response was, "Know your values, but don't just know them, *write them down*." The values that were part of his company's culture and which he endeavored to inculcate into his employees were: *Courage, inspiration, respect, judgment, wellness, and loyalty.* Walker believed that "for a business to last 100 years, it can't be about you, because you don't scale only your ideas and your story and your values do. As long as you know them and share them" (Roz 2020).

## Manifestations of Organizational Culture

The key constituents of organizational culture such as values, beliefs, norms, assumptions, language, ethical guidelines, and traditions are abstract and invisible. However, they are manifested in a variety of ways both directly and indirectly. This is important because they function as reminders to members and clients as to what the company stands for and how their actions should be in line with the company's culture. The following reveal the consequences of an organization's culture:

1. **Buildings and Offices**

   The size and configuration of a company's buildings and offices are visible clues to its culture. Is the building large, ornate, ostentatious? Is the name of the company on the outside of the building? Is it lit up and thus visible all day and night? Enron, for example, the energy company that was a high-flying darling of Wall Street only to crash and have its top executives indicted and sent to prison for accounting fraud among other things, had its name depicted in huge steel letters outside of its office at a conspicuous angle. On the other hand, Walmart's headquarters in Arkansas is "bare bones" in comparison. The headquarters of banks and other financial institutions convey an image of strength and solidity as projected in their buildings.

   The ways in which the organization's offices are decorated and configured are also clues to its culture. Are its offices all the same size or of different sizes? Are they decorated with expensive artwork or is such absent? Is there a relationship between the location and size of the offices and the ranks of the people occupying them? Are there separate cafeterias for top management and lower-level employees? If there is, it reflects an emphasis on power-status relationships within the organization. Does the organization have any enclosed offices at all for the majority of its members? When Michael Bloomberg became mayor of NYC, he did away with individual offices and had people of varying positions and rankings (himself included) work next to each other in one large room. Some have people work in cubicles that are partitioned from each other to maintain a modicum of privacy.

2. **Dress Codes**

   Does the organization have a dress code for its members, and if so, how strictly is it enforced; or are people allowed much discretion regarding their attire? In the 1950s, for instance, it would be unheard of for employees who were not performing physical labor not to wear a dress shirt, tie, and suit, or sports jacket. Sometimes, companies such as IBM would even specify the color of the clothes that were worn by employees. Now things have changed radically where "casual attire" is not only okay but seems to be, at least implicitly, preferred by some organizations. Dress codes or the lack of them can also be industry-specific. Airline pilots wear uniforms to convey authority. Technology, advertising, and social media companies, for example, are most apt not to have dress codes or if they do very flexible ones.

3. **Language**

   The manner in which employees address one another and their clients as well as how their positions are labeled tells much about an organization's cultural values. Are they expected to address higher ups by their last names or encouraged to use their first names? In recent years, for many companies, people

whose title were salesmen or sales ladies are now called sales associates. When Charles Schwab & Company acquired U.S. Bank, executives at U.S. Bank were taken aback when they learned that Schwab personnel used the word "customers" rather than "clients" (McShane and Von Glinow 2010). Words have both denotations and connotations and those such as "sales associates" and "clients" elicit more positive connotations than that of "salesperson" and "customer." Similarly, the ways in which a company's products are labeled reflects its culture. "Used cars" has a somewhat negative connotation, that is why such cars are now labeled as "preowned" by companies that sell them.

The degree to which cursing, expletives, or risqué comments or jokes are used and tolerated is also telling about a company's culture. The leader's use of humor signals what norm violations are acceptable in the workplace, and such signaling can lead to problem behavior in employees (Yam 2017).

The manner in which choice of language affects employees' interactions and also projects a particular image of the organization is clearly illustrated in Duff McDonald's depiction of how the consulting firm McKinsey became world famous and viewed as the "best of breed." (2018). Marvin Bower became head of McKinsey when James McKinsey passed. He is correctly seen as the "real architect and visionary of the firm." Upon his arrival, he orchestrated the following linguistic substitutions: McKinsey had *clients* not customers, its consultants *played a role* rather than working at a job, *it had a practice and firm members* not a business and employees, the firm did not negotiate with clients (he felt the term connoted an adversarial relationship) rather they *made arrangements*, it did not have rules, it had *values*. Perhaps most important, McKinsey was not a company; it was *The Firm* (McDonald 2013).

The changes in corporate terminology that Bower initiated not only functioned to project an *elite* image of McKinsey to the world and potential clients but also to its current and potentially future personnel. Moreover, it also served to differentiate it from its competition. Language both reflects and reinforces a company's culture.

4. **Slogans**

   Many organizations use slogans in their advertising as well as internally which certainly symbolizes their culture. When used internally, it is a way to socialize members into the organizational culture. These slogans are likely to become strongly associated with the organization in peoples' minds because of their repeated use in commercials, billboards, advertisements, and other communication outlets. Their pithiness and cleverness also contribute to their recall. One that would immediately come to mind for many people is "the customer is always right." It was most associated with Marshall Field's department store located in Chicago. Another is "the sale begins when the customer says no" which has been used by many companies when it became the title of a book by Elmer. Sy Syms, founder of Syms clothing store, was well-known by the slogan "an educated consumer is our best customer." Perhaps one of the shortest one was THINK used by IBM. Sam Walton, founder of Walmart, said that, "The two most important words that I ever wrote were on that first Wal-Mart sign, 'Satisfaction Guaranteed.' They're still up there and have made all the difference" (Walton 1992).

5. **Stories and Anecdotes**

   An organization's culture is also expressed via stories and anecdotes which convey specific values and prescribe desired behaviors towards organizational members and other stakeholders (Cooper et al. 2017). These stories and anecdotes serve to "concretize" and make tangible values and themes which are abstract. Many are about how the company was founded by people who were passionate about a vision they had for a particular product or service resulting in them leaving college or a job in order to pursue their vision. College buddies working in a garage or in their dorms developing prototypes of their invention are legendary. Michael Dell, for example, founder of Dell Technologies, ran his business from his dorm room, and then after signs of it becoming

successful dropped out of college. Apple founders Steve Jobs and Steve Woznick worked out of Jobs' garage and both left colleges to develop Apple. Likewise, Mark Zuckerberg and his college friends developed Facebook from their dorm rooms. Zuckerberg ultimately dropped out of Harvard to build the company.

6. **Rituals**

Organizational rituals represent another way in which aspects of an organizational culture are manifested. Rituals are "a form of social action in which a group's values and identity are publicly demonstrated or enacted in a stylized manner, within the context of a specific occasion or event" (Scandura 2019). One telecommunications company, for instance, developed the ritual of sending a loud wolf-cry sound over their speakers each time an employee closed a sale. Some companies have motivational song and dance routines which employees may perform prior to performing their work roles. One of the most famous ones is the Walmart Cheer, which goes like this:

Give me a W!
Give me an A!
Give me an L!
Give me an M!
Give me an A!
Give me an R!
Give me a T!
What's that spell?
Walmart!
What's that Spell?
Walmart!
Who's number one?
THE CUSTOMER!

This ritual was and still is performed at the start and conclusion of meetings and when employee shift changes occur.

Rituals function to motivate employees and to serve as a reminder of the organizations' core values.

## Strong Versus Weak Organizational Cultures

Strong organizational cultures involve "high levels of agreement among employees about what they value and high intensity towards those values. When both are high a strong culture exists" (Scandura 2019). The extent to which members internalize their organization's culture is always a matter of degree. When strong organizational cultures exist, members have deeply accepted the culture and their behavior towards each other, clients and other stakeholders reflects it. Weak organizational cultures, on the other hand, is when the culture has not been strongly accepted. In addition, members may have certain values that are in conflict with that of the organizations. These may have originated from other organizations they may have worked for or are simply a part of their personal value system.

## Organizational Subcultures

Just as subcultures exist within a society's overall culture, they also emerge within organizations. A subculture is a segment of the larger culture that "share distinguishing beliefs, attitudes and/or norms that set them apart in some significant manner from the dominant culture". Organizational subcultures may either reinforce or contradict elements of the larger organizational culture; they usually develop within specific departments or divisions of organizations. They may have subgoals which conflict with the larger organization or other organizational subcultures. For example, credit authorization departments are likely to be risk-averse and reluctant to grant credit to customers whose credit rating is problematic; however, the sales department, given its emphasis on increasing sales, is apt to embrace risk. Similarly, advertising and marketing departments may want to convey an image of the company that is not entirely accurate to put it in a very positive light while the company's legal department wanting to avoid any litigation is likely to look unfavorably upon such efforts.

## Ideal and Real Organizational Cultures

While an organization's culture may convey a particular set of values, beliefs, and expectations, it does not necessary follow that its members'

behavior will reflect them. Indeed, members may behave in ways that are incompatible with the professed culture. Many organizations have a "real" culture, while espousing an "ideal" culture to various stakeholders. There are several reasons why there may be a divergence between an organization's real and ideal culture. One of them would be inadequate acceptance of the ideal culture by members which will be discussed in the section on organizational socialization. Another would be because some values within the overall culture may conflict with each other. For example, the value placed on profit maximization and increasing shareholder value may be incompatible with values that stress the welfare of employees in terms of safe working conditions, fair wages, and benefits. Moreover, employees that have worked for other organizations may still have internalized that company's culture elements of which may be in conflict with that of their new employer's culture.

## Risk-Taking and Organizational Culture

The extent to which an organization is willing to take prudent risks is a common and important element of start-up cultures. As Flood states "Risk taking has become synonymous with entrepreneurship and that one must not be averse, or immune to uncertainty to become an entrepreneur" (Flood 2021). Actually, the propensity towards risk-taking and not being obsessed with fear of failure is also a salient feature of U.S. culture. In contrast to U.S. culture, failure is seen as a source of shame in Japanese culture (Syed 2015). "Failure is seen not as an opportunity to learn but as a demonstration that you don't have what it takes. . .blame for business failures is common and often intense in [Japanese culture]" (Syed 2015).

Typical of the mindset which has a positive view of failure was Henry Ford's responses to the failure of the first two automobiles that he developed and marketed. Rather than viewing them as abject failures, he saw them as valuable lessons about pricing and quality which were instrumental in the success of his third car and the Ford Motor Company (Syed 2015). Ford's view of "failure" and also that of Edison's after testing hundreds of metals to determine which would be suitable as a filament for the light bulb could be summed up as the belief that, "Failure is simply the opportunity to begin again, this time more intelligently" (Cabrera 2018).

Data on entrepreneurship indicates that Japan has the lowest annual entry rate for new enterprises among OECD nations (Syed 2015). This data can be causally related to the Japanese conception of failure as shown by a survey conducted by the Global Enterprise Monitor which indicated that, "Japanese citizens demonstrated the highest fear of failure; Americans, one of the lowest among the twenty countries surveyed." Syed makes the important point, however, "That fear of failure is not an inherently bad thing. It is smart to consider risks and exercise caution if they are deemed severe." He quotes Richard Branson, founder of Virgin Airlines, who said that, "The problem arises when opportunities exist but it remains psychologically impossible to even engage with them. The problem is when setbacks lead not to learning but to recrimination and defeatism."

## Organizational Culture and Ethics

Corporate ethical behavior or lack of it is dependent, in large part, on organizational culture and the degree to which it is stressed. Ethical conduct among members of the organization and between members and stakeholders is very much affected by the organizational culture. At times, the values expressed in the organization's culture may be in seeming conflict with certain organizational goals. For example, values stressing integrity, honesty, and doing what is in the best interests of the customer may conflict with values stressing profit maximization and the creation of shareholder value. In such cases, the degree of emphasis placed on each may determine which is the main determinant of employee's behavior. A good example would be Wells Fargo Bank where many of its sales employees were found to put their customers into products without the customers'

knowledge or consent. The pressure to meet corporate sales quotas was greater than having a quasi-fiduciary relationship with clients. Other examples would be the revelation that the tobacco industry knew for many years that smoking was both addictive and harmful to health, yet continued to deny such publicly. In these cases, the value given to maximization of profits and maintenance of the company's public image superseded the value of integrity.

## Organizational Socialization

An organization's culture already exists when a new person joins the organization. Organizational socialization must occur whereby the person will learn and internalize the culture of the organization. There are several ways in which this occurs. Many times, the person will already have some idea about the organization and its culture and for that reason be attracted to it as a potential employee. These notions may have several sources, friends, or relatives who work there, the organization's advertisements, or the individual's personal experiences with the organization as a customer or consumer of its product or services. In addition, college students may have served internships at organizations and thus gained an "insiders" perspective about the company.

If the person's perceptions of the organization and its culture is accurate, and compatible with his/her views, organizational socialization will be greatly facilitated; there will be a good "fit" between the person and the organization. However, even if there is a "good fit" between the new member and the organization's culture, socialization is still necessary.

Organizations use several methods to instill its culture into newly hired personnel. Among them are reading material in the form of manuals, audio-visual and in-person presentations as well as assigning someone to mentor the new hire.

Since start-ups do not have a long history, if any, the founders of the company have a much greater role in establishing an organization's culture than would be the case with a relatively mature company. Founders that have strong personalities and definitive philosophies of management and value orientations will incorporate such into the developing organizational culture.

Reid Hastings, founder of Netflix, created a "culture deck" consisting of about 130 slides indicating "what the company wanted to be and how we wanted to operate" (Roz 2020). Initially, he used it to socialize new hires into the company's culture. Interestingly, though, he soon realized that in addition to it being used as a teaching method, it could also function as a way to determine which job candidates would be compatible with Netflex's culture and which would not, thus it also served as a screening mechanism.

Roz comments that, "by defining exactly who they were, what they believed in and how they would operate and then putting it down on paper and out into the world, Netflix not only screened out suboptimal job candidates before they even applied, but they also got many people becoming candidates that might never have thought about Netflix."

## Organizational Socialization Agents

Coworkers play a crucial role in transmitting the organizational culture to new members. They are apt to be in close proximity to them and are likely to desire to help socialize the novice especially if their performance is partially dependent upon the new person performing his job well. Some may be told to mentor new hires, others may do so on their own.

Scandura cites the example of Whole Foods Market, the "health food" supermarket. Cofounder John Mackey refers to the company's "yogurt culture" in which the company reassigns veteran employees to new stores to convey Whole Foods corporate culture to newly hired personnel. Mackey notes that in the company's Columbus Circle store about 25% of personnel were transferred from other stores. "They were the starting culture for the fermentation that turned Columbus Circle into a true Whole Foods store" (Scandura 2019).

Organizational culture is also reflected by what its leaders pays most attention to or do not (Cooper et al. 2017). When sexist or racist jokes or behaviors are reported by employees, does the organization take strong steps to penalize those who engaged in such activities and develop "sensitivity" training sessions for members, or does it tend to ignore such reports or even worse blame the victims? Once the "me too movement" gained traction numerous women came forward and reported that they were subjected to various forms of sexual harassment and upon reporting such incidents to their supervisors no remedial actions were taken. In certain industries such as investment banking and movie production, the existence and tacit acceptance of various forms of sexual harassment were an ingrained part of the organization's culture. On the other hand, recently, when the owner of the New York Mets baseball team found out that his newly hired general manager had been sending a stream of sexually inappropriate text messages to a female reporter, the GM was immediately fired.

How an organization reacts to some type of crisis situation also reflects its culture. How does it respond, for example, when it loses a major customer or supplier or when one of the products it has on the market has been found to be defective, perhaps causing injuries or death to consumers? If "adaptation" and "flexibility "are key features of the organization's culture and folklore and have been adequately internalized by members, then chances are good that the organization will respond in ways that enable it to survive the crisis. On the other hand, if those components are missing, it would be more difficult for the organization to navigate the crisis. Sometimes, its attempts to do so would result in positive changes in the culture. Many organizations were not prepared to deal with the COVID-19 pandemic but saw that they could function at acceptable levels by having employees work from home and communicating virtually using Zoom. Consequently, several may continue this mode of operation, at least partially, even after the pandemic passes.

The organization's reward system is another way that its culture is conveyed to members. Are rewards mostly in the form of tangibles such as pay, bonuses, stock options, or in the form of intangibles such as praise, titles, ceremonies, or plaques marking members' achievements? Do the rewards emphasize individual or collective achievement and collaboration? Does the organization emphasize quantity or quality of its members' performance? For instance, customer service personnel may have their phone conversations with customers monitored, and the criterion may be the number of customers served within a particular time frame rather than the quality of the interaction and the extent to which the customer's problem was solved.

## Conclusion

Organizational culture is a significant but often overlooked aspect of organizations. It affects, directly or indirectly, virtually all aspects of an organization's operations in one way or another. The culture is especially influential in how members interact with each other, and with their current and potential customers as well as other stakeholders. The major features of the culture are transmitted to members via a variety of ways and internalized to varying degrees. The founders of a start-up are the primary drivers of the company's culture. Their personalities and philosophy of management will be reflected in the culture. Recruiting personnel who represent a good "fit" between the organizational culture and themselves is important for the success of the company. Attraction or aversion to risk-taking, ethics, allocation, and form of rewards and crisis management are some of the areas where organizational culture will exert itself.

# Organizational Culture and Supervisors' Attitudes Toward Change, Mediating Role of Organizational Commitment

Aaron Kweku Amanor
Department of Psychology, University of Ghana, Accra, Ghana

## Synonyms

Change implementation; Change initiative; Change managers; Change readiness; Employee behavior

## Definition

Attitude toward change refers to an employee's overall positive or negative evaluative judgment of a change initiative.

## Introduction

In recent time, telecom organizations have come under intense pressure to initiate reforms and changes to cope with rising rate of innovation in order to meet market demand (Ahmad and Cheng 2018; Chavula 2013; Aker and Mbiti 2010). Despite the fact that organizational change happens frequently in most organization, studies show that about 70% of all change initiative fail (Hassan et al. 2020; Choi 2011; Beer and Nohria 2000). While the failure of most of these change initiative may have several causes, few are as a result of attitudes toward change (Jones et al. 2008; Choi 2011). This attitude toward change has been described as an employee's overall positive or negative evaluative judgment of a change initiative implemented by his or her organization (Elias 2009).

The general argument in change literature is that employees with different rank and positions in an organization turn to demonstrate different attitudes toward organizational change. Studies have shown that executives, supervisors, and non-supervisors differ in their attitudes during large-scale organizational change (Kanter et al. 1992). According to Kanter et al. (1992), the executives (the change strategists at the top of the hierarchy), supervisors (change managers), and non-supervisors (change recipients at lower levels) are the three most important group of employees within the organization. They claim supervisors and non-supervisors experience high risk associated with the effect of change than the executives, while supervisors and non-supervisors are most likely to lose their job and status during organizational change. It has been noted that supervisors are interested in the potential outcome of a change and expresses different attitudes and perceptions about organizational change, which is a reflection of the differences in their level of influence, autonomy, and power (Jones et al. 2008). Thus supervisors have a prime and central role in ensuring the successful implementation of change initiative. The centrality of supervisors' role is that they create a link between the objectives of management and the daily work of change recipient because they often have access to information due to their closeness to management (Robson and Tourish 2005). However, research has posited that many change initiatives fail because change agents often

underestimate the influential role supervisors' attitudes play in determining change outcomes (Bartunek et al. 2006; Van der Voet et al. 2015).

Again, literature suggests that there is a rising acknowledgment of the influence of organizational culture and commitment on change implementation success (Vakola and Nikolaou 2005; Baird et al. 2011). The challenge therefore for most researchers is how to determine the role of organizational commitment in the relationship between culture and attitude toward organizational change. This strongly indicates that a research should be carried out to examine supervisors' attitude toward organizational change and the role of organizational commitment, within the Ghanaian telecommunication industry.

In an attempt to address these concerns in the literature, the study seeks to investigate whether organizational commitment affects the relationship between organizational culture and supervisors' attitude toward organizational change.

This study is particularly important as it provides a better understanding of the relationship between organizational culture and attitudes toward organizational change, and the role organizational commitment plays in ensuring the success of organizational change, particularly in the Ghanaian telecommunication industry.

## Literature Review

### Organizational Culture, Commitment, and Attitude Toward Change

According to Goffee and Jones (1998), culture is the way in which people relate to each other, involving the exhibition of the behaviors of Sociability and Solidarity dimensions for the benefit of the organization. It sets out the norm and is helpful in shaping attitudes toward change (Sorensen 2002). It impacts all aspect of organization's life and therefore has a significant effect on employee behavior (Berry 2004). Most authors also agree that culture has an impact on change efforts in an organization (Buchanan et al. 2005). Some cultures are more flexible, more adaptive toward changes in an organization than others. According to Sorensen (2002), an organization with a strong culture is very efficient in refining and improving established competences to handle organizational change. Strong cultures have an agreed set of values and small changes will be accepted, hence implementing change would be less difficult. Choi and Ruona (2011) and Weiner (2009) agree that organizational culture is one of the most important contextual factors that negatively or positively affect attitudes toward organizational change. These scholars concede that the different types of organizational culture impact the level of individual attitude toward organizational change (Choi and Ruona 2011; Weiner 2009) and that culture with the dimension of sociability and solidarity influences reception and adaption to changes in organization (Pinto et al. 2011).

Organizational commitment is explained as a strong belief by an employee, in the missions and objectives of an organization, a wish to continue a relationship with the organization and a readiness to devote substantial effort to improve performance of the organization (Michael et al. 2009). Suliman (2002) argues that organizational commitment is a significant mediating variable which shapes and influences organizational outcomes. Yousef (2000a, b) examined the mediating role of organizational commitment in predicting attitudes toward organizational change, and found that organizational commitment directly influences attitude toward organizational change. Again, organizational commitment also did act as a mediator between the predictor and attitude toward organizational change.

Although organizational commitment has been found to have a significant influence on employees' attitudes toward organizational change (Nafei 2014; Vakola and Nikolaou 2005; Visagie and Steyn 2011; Yousef 2000a), a thorough literature review, however, generally indicates that organizational culture is an antecedent of organizational commitment (Rashid et al. 2003; Van Stuyvesant Meijen 2007). Findings of Lok and Crawford (2004) revealed that supportive cultures had positive influences on organizational commitment, thus buttressing the assertion that there is a significant influence of organizational culture on organizational commitment.

A positive influence of organizational culture on attitude toward change has been found in literature (Al-Zu'bi 2011; Haffar et al. 2014; Rashid et al. 2004). Studies by Chen (2004) and Lok et al. (2005) found positive influence of organizational culture on organizational commitment. Furthermore, organizational commitment has a positive influence on attitudes toward organizational change (Nafei 2014; Vakola and Nikolaou 2005; Visagie and Steyn 2011). That means, organizational culture has been found to influence organizational commitment; and attitude toward change has also been found to be a consequent of organizational commitment, thus suggesting that organizational culture can equally influence supervisors' attitudes toward organizational change through organizational commitment. Therefore, based on the review of existing literatures, the study hypothesizes that:

H1: Organizational commitment will mediate the relationship between organizational culture and supervisors' attitudes toward organizational change.

## Methodology

### Research Setting

I-Zone Company Limited, a Telecommunication distributor for MTN Ghana, is considered for the study. The company is currently undergoing major changes. The company's restructuring includes implementing new rules and procedures which made the entire employees perform their job in a different way. The restructuring has also altered the company's internal structure, redefining the working relationships, the merger of some departments, and changes to work practices. These recent changes in the company make the company very suitable for the research.

### Research Design and Sampling Techniques

To meet the objectives of the study, the researcher employed the quantitative approach and the cross-sectional survey design in data collection and analysis, using a standardized questionnaire. A two-stage sampling process was adopted in this study. The first stage involved selecting the organization in the telecommunication sector while the second stage involved selecting the individual supervisors to form the sample of the study. Considering the nature of this research, the purposive sampling technique was used to select the study organization. This was then followed by a simple random sampling technique to select the individual supervisors from the company for the study.

### Sample Size and Survey Administration

Based on the sample size determination by Miller and Brewer (2003), sample size approximated to 180 supervisors was selected for the study. Permission was sought from the Human Resource Department of I-zone Limited, the organization used in this study. Questionnaires were distributed with the assistance of the departmental head of human resource to the randomly sampled supervisors. The questionnaires contained clear detailed information on how to fill them correctly. Notwithstanding, the instructions were further explained before handing over the questionnaires. Ethical principles like confidentiality, freedom to quit, informed consent, and promise of no harm to respondents were considered in the study. Detailed instructions regarding the purpose of the study and voluntary participation in the research were clearly spelt out. In addition, respondents were informed that there was no adverse effect should they participate or decline to participate in the research. To ensure confidentiality and anonymity of responses, respondents were instructed not to write their names on the questionnaires to disclose their identity. Furthermore, all the respondents were given an envelope into which they sealed their completed questionnaire before submitting it. Finally, respondents were also made to understand that the research was strictly for academic purposes and their responses will be handled with utmost confidentiality and privacy.

Out of the 180 questionnaires administered, 170 were retrieved and deemed suitable for data analysis. Thus a response rate of 94.44% was obtained. Of the respondents in the final sample, 83 (representing 48.8%) were males whiles 87 (representing 51.2%) were females. Majority of the respondents were between the age group of

25–34 years (112 of the respondents, representing 65.9%), while majority of respondents were holding diploma/HND certificates (86 of the respondents, representing 50.6%).

## Data Collection Instrument

### Measure of Organizational Culture

Organizational culture scale developed by Goffee and Jones (1998) was adapted to measure organizational culture (behavior of solidarity and sociability). The instrument consists of 23 items. Individual responses to the questions were measured on a five-point interval scale. The responses ranged from 1 (strongly disagree), 2 (slightly disagree), 3 (neither agree nor disagree), 4 (slightly agree) to 5 (strongly agree). The Cronbach's alpha reliability coefficient was 0.72.

### Measure of Organizational Commitment

The Organizational Commitment Questionnaire (OCQ), which was developed by Mowday et al. (1979), was used in measuring organizational commitment. This instrument consists of 15 structured statements. Individual responses to the questions were measured on a seven-point interval scale. The responses ranged from 7 (strongly agree), 6 (moderately agree), 5 (slightly agree), 4 (neither agree nor disagree), 3 (slightly disagree), 2 (moderately disagree) to 1 (strongly disagree). The Cronbach's alpha coefficient was 0.82.

### Measure of Attitude Toward Organizational Change

Supervisor's attitudes toward organizational change in general were measured using the attitudes toward organizational change questionnaire developed by Vakola et al. (2004). The scale consists of 29 items (15 positives and 14 negative items), and respondent must indicate the extent to which they agree with each item on a five-point scale ranging from 1 (strongly disagree), 2 (slightly disagree), 3 (neither agree nor disagree), 4 (slightly agree) to 5 (strongly agree). High scores on the scale represented positive attitudes while low scores on the scale represented negative attitudes toward organizational change. The Cronbach's alpha reliability coefficient was 0.89.

## Analysis of Data

The research employed both descriptive and inferential methods of analyzing data using SPSS. The descriptive analysis approach was used to analyze the demographic data of the respondents to represent data in the form of summary statistics such as means and standard deviations. The Pearson product moment correlation was used in conducting correlation analysis in order to describe the strength and direction of the linear association between the variables (Pallant 2005). Correlation analysis was also used to test multicollinearity. Hypotheses were analyzed using a regression in order to examine the influence of the predictor variable on the dependent variable.

# Result

## Descriptive Statistics and Correlation

Descriptive statistics, standard deviation, and correlations among the variables are presented in the table below.

From Table 1, it is observed that a positive significant relationship exists between organizational culture and attitude toward organizational change ($r = 0.460$, $p < 0.01$) at 1% level of significance. Also, a positive significant relationship is observed between organizational commitment and attitude toward organizational change ($r = 0.596$, $p < 0.01$) at 1% level of significance. This means that there is linear relationship between organizational culture and attitudes toward change as well as between organizational commitment and attitudes toward change. With regard to multicollinearity, the correlation coefficient ($r = 0.40$) between the independent variable; organizational culture; and organizational commitment is below the threshold of 0.70 which indicates a low multicollinearity between the independent variables.

## Hypothesis Testing

### Analysis on the Mediating Effect of Organizational Commitment on Organizational Culture and Attitudes Toward Change

In testing the hypothesis: "organizational commitment will mediate the relationship between

Note: (**) =0.01, (*) =0.05, n = 170

organisational culture and supervisors' attitudes toward organizational change," several regression analyses were conducted and significance of the coefficients was examined at each step as proposed by Baron and Kenny (1986) for testing mediation. In step one simple linear regression analysis was conducted with organizational culture predicting attitudes toward organizational change. The results are presented in Table 2.

In step two, simple linear regression analysis was conducted with organizational culture predicting organizational commitment. The results are presented in Table 3.

In step three, simple linear regression was conducted with organizational commitment predicting attitude toward organizational change. The results are presented in Table 4.

From Table 2, it is observed that organizational culture significantly predicts attitude towards change ($\beta = 0.460$, $t = 6.722$, $p = 0.00$). Thus, the first condition was satisfied. Table 3 also shows that organizational culture significantly predicted organizational commitment ($\beta = 0.400$, $t = 5.66$, $p = 0.00$). Thus, the second condition was also satisfied. Table 4 also shows that organizational commitment significantly predicted attitude toward organizational change ($\beta = 0.596$, $t = 9.624$, $p = 0.00$). Thus, the third condition was also satisfied. This result indicates that all the three conditions have been met.

In the fourth step, a standard multiple regression was conducted with both organizational culture and organizational commitment predicting attitudes toward organizational change to check for any mediation effect. The results of the standard multiple regression analysis are presented in Table 5.

The results shown in Table 5 indicate that the regression model is well fit ($F = 58.96$, $p = 0.000 < 0.05$). From Table 5, the standard

| 1 Constant | 42.04 | 7.21 | | 5.84 | 0.000 |
| Commitment | 0.872 | 0.091 | 0.596 | 9.624 | 0.000 |

Dependent: Attitude toward change, R2 = 0.36

**Organizational Culture and Supervisors' Attitudes Toward Change, Mediating Role of Organizational Commitment, Table 5** Summary of standard multiple regression

| Model | Unstandardized coefficients | | Standardized coefficient | | |
|---|---|---|---|---|---|
| | B | Std. error | Beta | t | Sig. |
| 1 Constant | 27.73 | 7.73 | | 3.59 | 0.000 |
| Commitment | 0.717 | 0.095 | 0.490 | 7.58 | 0.000 |
| Culture | 0.296 | 0.072 | 0.264 | 4.08 | 0.000 |

Dependent: Attitude toward change, $R^2 = 0.41$, $F = 58.96$

multiple regression results indicate that organizational commitment significantly influence attitudes toward organizational change ($\beta = 0.490$, $t = 7.58$, $p = 0.00 < 0.05$). Again, it is observed that culture still has a significant influence on attitude toward organizational change ($\beta = 0.264$, $t = 4.08$, $p = 0.00 < 0.05$), when the mediating variable was introduced. This confirms that both organizational culture and organizational commitment significantly predict attitudes toward organizational change. Thus, a partial mediation exists. This means that organizational commitment partially mediated the relationship between organizational culture and attitudes toward organizational change. In other words, in the presence of organizational commitment, organizational culture still influenced attitude towards change directly, as well as indirectly through organizational commitment. Therefore, the hypothesis was also confirmed.

The indirect effect estimate was calculated manually using Judd and Kenny's (1981) formula. This was done by subtracting the unstandardized regression coefficient between the predictor and the dependent variables of the fourth step from that of the first step.

Thus, $B_{indirect} = B - B1$; thus, $0.516–0.296 = 0.22$.

Therefore, the indirect effect estimate between organizational culture and attitude toward organizational change through organizational commitment was 0.22. The Percentile Bootstrapping Confidence Interval Method was used to test this indirect effect estimate for significance. The results of this are presented in Table 6.

From Table 6, it is observed that the indirect effect estimate (0.22) was significant (0.003) at 5% level of significance. This strengthens and confirms the partial mediation found. Thus, there was a partial mediation, and the indirect effect was significant.

**Organizational Culture and Supervisors' Attitudes Toward Change, Mediating Role of Organizational Commitment, Table 6** Percentile Bootstrapping to Test the Significance of the Indirect Effect

| Relationship | Estimate | L.P | U.P | Sig. |

## Discussion

With regard to the hypotheses in question, the results show that organizational commitment partially mediated the relationship between organizational culture and attitudes toward organizational change among the supervisors. This finding is partly in agreement with studies in which organizational commitment has been found to mediate the relationship between attitude toward organizational change and other organizational outcomes such as job satisfaction (Yousef 2000a) and work ethics (Yousef 2000b). Similarly, Suliman (2002) explored the mediating effect of organizational commitment and also found that organizational commitment plays a partial mediating role between organizational climate and performance. Suliman (2002) therefore argues that the importance of organizational commitment is due to its influence as a significant mediating variable in shaping organizational outcomes.

Inferring from the findings of this study and those in the reviewed literature, this mediating role of organizational commitment in the current study does not come as a surprise. First, a positive influence of organizational culture on attitude toward change was found and confirmed by literature (Al-Zu'bi 2011; Haffar et al. 2014; Rashid et al. 2004). Secondly, it was found that organizational culture has a positive and significant influence on organizational commitment, which is also confirmed in the study conducted by Rashid et al. (2003) in Malaysia which revealed a positive association between organizational culture and organizational commitment, further suggesting that the perfect linkage between organizational culture and organizational commitment can yield a good benefit to the performance of the organization. Similarly, Van Stuyvesant Meijen (2007), in a study in South Africa, found out that organizational culture had a significant positive relationship with organizational commitment. Other studies such as those of Chen (2004) and Lok et al. (2005) also found and confirmed the positive influence of organizational culture on organizational commitment. And lastly, a positive influence of organizational commitment on attitudes toward organizational change was found, and also confirmed by literature (Nafei 2014; Vakola and Nikolaou 2005; Visagie and Steyn 2011).

Deducing from these findings and the positive significant relationships that has been established between the variables, it is not out of place to argue that organizational culture has both a direct influence and indirect influence through commitment on supervisors' attitudes toward change. Direct in the sense that organizational culture which comprises of the dimensions of sociability and solidarity influences employees' reception and adaption to changes in the organization, as indicated by Pinto et al. (2011). More notably, the indirect influence is justified on the basis that supportive cultures are seen to influence organizational commitment positively, and organizational commitment in turn has been found to influence attitude toward organizational change, in the event that the change would benefit employees (Vakola and Nikolaou 2005). This current finding thus justified the interrelationships that have been found both in this study and in related literature among organizational culture, organizational commitment, and attitude toward organizational change. The finding also supports the idea that supervisors who embrace the culture of the organization are more committed to their organization and subsequently very willing to accept change as long as the change does not seek to modify the norms and objective of the organization.

## Conclusion

The aim of this study was to examine the mediating effect of organizational commitment on the relationship between organizational culture and supervisors' attitude toward organizational change. Based on the findings, the study concluded that when the culture that exists in the organization is supportive socially, to a large extent, it is enough to engender commitment from supervisors and subsequently influence supervisors' positive attitudes toward change in the organization.

## Study Limitations and Recommendation

This study has some limitations. First, data for the study was gathered from one single organization. Conducting a research with one organization might lead to findings that are dependent on specific organizational characteristics. Secondly, the design of the study was cross-sectional which collected information at one point in time. This design restricts the researcher's ability to deal with development of organizational change and its effect on supervisors' attitudes over a period of time. Also, the generalizability of the research report could have been enhanced by involving more organizations but time and logistic constraints did not allow for that. In spite of these limitations, the findings from the study have important recommendation for change agents.

It is recommended that before starting an implementation of change initiatives, change agents must ensure supervisors are in a position

to accept the values and goals of the organization, and are willing to put in effort to help the organization.

For future research, it is suggested that the study be replicated within another business industry, as it is relevant to verify if these results maintain their stability among industries with different characteristics.

# Organizational Decision-Making

Paul C. Nutt
Fisher College of Business, The Ohio State University, London, OH, USA

## Synonyms

Choice theory; Consultation; Participation/negotiations; Problem solving

## Definition

Arena of action: Concerns and difficulties found to be meriting attention.
Best practices: Techniques or analytics found to be an effective way of dealing with one or more of the phases of decision-making.
Decision-making: A process carried out by leaders to deal with concerns and difficulties confronting an organization.
Interests: Issues key people want to address by the decision.

## Introduction

Over the past several decades, empirical studies have uncovered the practices applied when making organizational decisions and their success (Nutt 2002). These studies collected more than 400 decisions identifying decision-making practices applied, along with external factors and results. A statistical analysis linked the practices applied with the decision's outcomes, accounting for the external factors. Sector was one of several external factors considered. Here the research compared differences across public and private sector decision-making, looking for practices that succeeded and failed in each sector (Nutt 2006). In addition, firsthand accounts of the decisions from the key participants were obtained. These accounts provided considerable detail into how decisions were made and why some practices were more successful than others, looking for insights into why some practices succeed and others failed.

These studies provided a number of key conclusions regarding decision-making effectiveness (Nutt 2002). Half failed making a failed decision a commonplace event in organizations (Nutt 1999). When failure was observed, a decision was discarded before an implementation attempt or following a concerted implementation effort; so no benefits were realized. Both the well-regarded and besieged managers working in well-regarded and newer organizations experience failure. The wasted resources and forgone benefits that resulted suggest the need for better

practices. Another key finding found that decision-makers in the decision studied were not at the mercy of changes in expectations, budgets, draconian regulations, and other external factors. Consequently, situational constraints that can pose obstacles and constraints were not the cause of failure. Instead, failure can be traced to the practices followed by the key decision-makers. Best practices doubled the prospect of success, regardless of the situation being confronted. Furthermore, no significant differences were found in the practices that tend to work and tend to fail when applied in public as compared to private organizations.

To illustrate how these findings apply to public sector decision-making, a decision in the database will be used as an exemplar. In this decision American Electric Power (AEP) set out to contain pollution in one of their power plants (Nutt 2010). Table 1 provides a summary of events that proceed and followed the pivotal decision in the AEP case. Both failure-prone practices and best practices will be highlighted in the discussion using the case to illustrate key points.

**Organizational Decision-Making, Table 1** Profile of the AEP pollution abatement decision

| Events | Key actions |
|---|---|
| Before | Gavin plant established in southern Ohio<br>Ash fallout prompts complains by Cheshire residents<br>EPA asks for study but no corrective action<br>AEP invests $7 million, only to exchange ash fallout for acid rain<br>Cheshire residents contact lawyers who suggest village buy out for $20 million |
| Pivotal decision | **Purchase village** |
| After | Ten percent of Cheshire residents refuse to sell<br>Negative publicity on a national scale<br>Complaints continue and EPA issues citations<br>AEP's proposal for a demonstration of a clean coal-fired plant rejected by DOE<br>Courts rule updated plants as well as new plants must have the most up-to-date pollution control<br>AEP's request to bill customers for pollution control costs rejected by courts |

Pivotal decision in bold. Case adapted from: Nutt (2010)

## Pollution Control at AEP

AEP is a major energy provider, operating more than 80 plants. The Gavin coal-burning plant in southeast Ohio began operation in 1974. Its smoke stacks sit within yards of Cheshire, Ohio, a village of 221 people. From the outset, there were complaints about ash fallout prompting the EPA to ask for a voluntarily reduction of the nitrogen oxide emissions. AEP mounted a study, finding that pollution abetments would be ineffective in summer months and took no further action. In the years that followed, more stringent regulations prompted the EPA to again call for a reduction in ash fallout. AEP spent $7 million to install the previous shelved plan (selective catalytic reduction or SRC system) at the Galvin plant. The SRC system proved to be ineffective, replacing one type of pollution with another. The plant now belched sulfur trioxide, causing a blue haze of sulfuric acid to engulf the village. Residents experienced burning eyes, headaches, sore throats, and white burns on their bodies. The EPA called on AEP to correct the blue haze problem. AEP balked. An investment of $7 million was seen as intensifying the problem, which argued against further investments. Cheshire residents engaged lawyers who suggested that AEP be approached to buy the village and suggested a price ($20 million). The residents agreed and allowed the lawyers to approach AEP. After receiving the offer, AEP analysts investigated, concluding that the purchase price would compensate the villagers at or above market value for the homes. Company officials agreed to the purchase, reasoning it would appease the villagers and turn aside growing negative publicity. In the agreement, residents were to wave their right to sue and conduct individual negotiations.

Complications arose. The attorneys were hired by villagers who wanted to sell their properties. After the deal had been stuck, 21 (10%) of the Cheshire residents refused to sell and kept the village intact. The local press labeled AEP as environmentally irresponsible, contending they bought a village rather than dealing with pollution, putting the decision into the national spotlight. The New York Times and the Washington

Post ran a series of stories connecting the decision to high-profile pollution debacles. Many residents were underage. A probate court stepped in and ruled that liability for haze-related health problems in children could not be removed by the deal. The village still exists, with the remaining residents on a village council that continues to sue. This has prompted nearby villages with public schools to take legal action, creating more potential liabilities.

Reviewing the actions taken suggest several flawed practices. First, what were AEP's aims? Assuming stifling complaints as the aim, there was no attempt to uncover stakeholder concerns and interests. Instead, the urge to resolve the controversy preempted due diligence. There were no studies undertaken beyond confirming property values. Second, the decision took shape as accepting or rejecting an offer to buy what turned out to be most, but not all, of the village. Company officials failed to consider potential liabilities and made no attempt to identify other options. There are several, depending on desired results. If the aim was to curb pollution turning off the SRC in summer months, reducing the use of low sulfur coal, other coal mixtures, or exploring shuttering the plant were options. If the aim was to deal with adverse publicity, the company could determine the people affected and negotiate directly with these parties to educate them, using proactive media and public relations to publicize the AEP position. Failing to work with residents to uncover their concerns ruled out these options. There was no attempt to understand legal liabilities, the scope of negative publicity, or the dangers of being seen as a poor corporate citizen by treating pollution as a real estate deal. Instead, AEP appeared to be a bullying business dodging its responsibilities using subterfuge to avoid compliance with clean air standards. There was no urgency to act on the buy out proposal. The EPA had not set a timetable, nor had the Cheshire residents. Officials have ample time to sort out their obligations and costs, such as risks, costs, and obligations, in a buyout, and to look for other options. Finally, desired results were obscured. Did AEP seek to limit liability, publicity, complaints, cost, future regulation, or responsibility? Without clarity here any proposed action will provoke objections.

The decision led to considerable negative fallout. AEP responded to a Department of Energy proposal for demonstrations of low pollution-free coal-burning plants without success. The courts ruled that AEP cannot make modifications to older coal-burning plants without first installing up-to-date air pollution technology. AEP attempted to charge customers for pollution investments, but a court challenge overturned the rate increase. AEP now faces large penalties unless the latest in pollution control is installed in both planned and modified plants, prompting delays in new plant construction. Pollution control technology now must reduce carbon dioxide emissions, a chief cause of climate change.

## Finding Best Practices for Decision-Making

My studies find that managers make decisions by working their way through a process, selecting practices along the way. Failure-prone practices were noted when decision-makers embraced a claim without study, ignored interests and interest groups, offered ambiguous directions, limited search, misused evaluations, overlooked ethical questions, and failed to learn (Nutt 2002, 2004). Many of these practices mislead officials in the AEP pollution control decision. Successful decision-makers reconcile claims from several sources, manage social and political forces that can block action, identify desired results, search widely and encourage innovation, estimate benefits and risks to realize options, uncover values behind ethical positions, and root out perverse incentives that block learning. Table 2 summarizes both practice types, to be illustrated with the AEP case.

### Select an Arena of Action

Organizational decisions are set in motion when a stakeholder makes a claim and seeks an endorsement (Cyert and March 1963). The claim specifies what the stakeholder believes a decision is about, its arena of action. Decision-makers often embrace opportunity-driven claims to appease a powerful stakeholder or to cater to interests they represent, without considering other claims. This

**Organizational Decision-Making, Table 2** Practices uncovered

| Failure-prone practices | Best practices |
|---|---|
| Adopt a claim (and claimant) without due diligence that implies or suggests a remedy | Reconcile the claims of key stakeholders to identify a need-driven arena of action |
| Implement using power and/or persuasion at the end of the process | Implementation begins early in the process using either participation or intervention |
| Ignore aims or allow expected results implied by a ready-made plan to serve as a proxy for aims | Make aims clear |
| Remedies suggested by a claim or from adaptations of current business practices displaces search | Allocate resources to carry out an aim-directed search. Identify multiple alternatives, with at least one having innovative features |
| Defensive evaluations applied to justify the preferred course of action | Evaluations used to document the benefits and risk of alternatives that address aims |
| Disregard ethical issues | Uncover and reconcile the values behind ethical positions. Align who benefits, pays, and decides |
| Allow perverse incentives that tolerate no failure | Stop punishing failure by acknowledging that some failure is inevitable and that blame is useless |

can mislead the effort and provoke opposition as interested parties question its justification and ponder what the decision should be about. AEP officials endorsed the village buyout, buying into claims it would eliminate a tiresome nuisance. There was no attempt to analyze the claim, to uncover competing claims, or to make the concerns behind each explicit, although gathering such intelligence is often recommended (e.g., Simon 1977). Instead, influential supporters made the buy out seem actionable (Cyert and March 1963; Pfeffer 1992; Pfeffer and Salancik 1974).

Such claims often prompt failure. Did AEP understand villager concerns, the concerns of villagers not a party to the lawsuit, or the concerns people in the surrounding areas? Without understanding such concerns, the arena of action (the buyout) becomes suspect (Pounds 1969). Company officials defined their stakeholders narrowly, overlooking the public stakeholder and the public's concerns about pollution as well as their expectations for corporate social responsibility. Successful decision-makers uncover the claims of key stakeholders, looking for hidden concerns. Key stakeholders may include top management teams, leaders of vital departments, technical experts, staffers with relevant experience (e.g., engineers), unions, suppliers, stockholders, creditors, customers, current and future alliance partners, supportive sister organizations, competitors, communities in which the organization operates, environment groups, and the general public. Best practice amalgamates the concern key constituencies to identify an arena of action that is needed, rather than opportunity driven.

AEP officials failed to reconcile their "keep the power on" mentality with the pollution being created. Ruminating about needs, suggested by stakeholder concerns, calls for a different arena of action. Comparing arenas of action and their merits to find an insightful one to direct action is more apt to lead to success (Cooperrider and Srivastva 1987; Kolb 1983; Fredrickson 1985).

### Deal with Interests and Interest Groups

Decision-makers often used their power and influence to promote a remedy suggested by the claims of key claimants. Implementing in this way typically requires an edict (do this) or persuasion (do this because). Both are failure prone (Nutt 1986, 1998b). An edict was used by AEP in their implementation of the village buyout. When using an edict, the best a decision-maker can hope for is indifference: People do not care enough to resist (French and Raven 1959). Often this is not the case. Using an edict to roll over interested parties produces resentment and token compliance in the powerless and resistance from others. This prompted failure in two of three decisions studied (Nutt 1998a). Persuasion was failure prone as well (Nutt 1986, 1998b). For persuasion to work, the parties to a decision must be open to rational arguments (Quinn 1980; Huysmans 1970; Doktor and Hamilton 1974). AEP officials, in their press releases, attempted to persuade the

public that the company was acting responsibly. Persuasion has little effect on people who believe they have something to lose, failing in half of the decisions studied (Nutt 1998a).

Edict and persuasion are often linked. If an edict fails, decision-makers resort to persuasion – now trying to explain why the decision has merit (Churchman 1975; Schultz and Slevin 1975, which has limited success. The initial power play of AEP officials assumed they could act as they wish, without censure. When this failed, arguments about maintaining power capacity were offered. By failing to find joint interests, AEP officials provoked opposition, putting their plan at risk. The positions of top managers made insiders wary, keeping them from offering their insights about the village purchase decision as it unfolded (Nystrom and Starbuck 1984). The insights of knowledgeable people could have brought out potential liabilities in decision (Denhardt 2000).

Successful decision-makers put implementation at the front of their decision-making efforts to uncover interests. If power can be shared, teams can be created and involve people with interests in making the decision (Beyer and Trice 1982; Downs 1967; Eisenhardt 1989). People are more apt to disclose their interests in a team-like setting (Nutt 2002). The act of uncovering an issue and finding a remedy promotes ownership in the remedy and increases its prospect of adoption. Even when not forced to do so, savvy decision-makers use participation in this way because it improves their chance of success (Hackman 1990). Another useful approach, called "intervention," extends the networking approach in claim/concern identification to demonstrate the need to act (Nutt 1998b). Current performance is documented and credible performance norms identified. Using this information, key parties are shown the importance of the decision by decision-makers, collecting and managing interests with each encounter. People are more likely to be supportive when networking makes them aware of performance shortfalls and the level of performance that is possible, making the need to act credible. Use participation when interested parties are localized. Use networking when dealing with diffuse or influential stakeholders, such as AEP officials meeting with regulators and consumer factions to identify their interests.

### Directing Search with Expected Results

Expected results were ambiguous in failed decisions (Nutt 1999, 2004). This confuses key players and squanders resources (Brunsson 1982; Mintzberg et al. 1976; Pounds 1969; Locke and Latham 1990). AEP officials were silent about their expectations. Did company officials seek to limit liability, publicity, complaints, cost, or responsibility? Or was AEP merely trying to resist government regulation? Perhaps the aim was to make a contentious situation go away. Each could be inferred from the actions and statements of officials. When expectations are ambiguous any proposed action can appear misguided. Insiders at AEP had no idea what was motivating the real estate deal and saw it as squandering company funds. Clarifying expected results eliminates misunderstandings and focuses search. This empowers key people to offer options, such as coal mixes that reduce emissions. By keeping their desired result under wraps, AEP officials denied themselves access to such ideas. AEP officials substituted a solution (village purchase) for thinking about ways to reduce pollution.

Best practice delays search until hoped for results can be agreed upon. Was AEP seeking to reduce the blue haze, eliminate a PR problem, or improve resident safety? Each points to a different type of solution. The hoped for result provides an aim. AEP decision-makers implicitly embraced an aim to keep power flowing. Others include reducing emissions, which point to remedies such as new coal mixes, bad day management, and SCR fine tuning. Still others suggest placating resident worries. This would call for working with consumer groups to identify their concerns and placate unfounded worries. Being clear about what is wanted also mobilizes support. Clarity here eliminates confusion and focuses effort. Best practice delays search until an aim is agreed upon.

### Search Broadly and Encourage Innovation

Four of ten decisions consider a single alternative, and this alternative was innovative in less than one

of ten decisions (Nutt 1993, 2002). Search was set aside when a remedy was plucked from claims or derived from existing practices. Both discourage search and stifle innovation. Nearly one third of the decisions adopted such a ready-made plan, effectively eliminating search (Nutt 2002, 2004). Decision-makers who became wedded to such a remedy make no effort to look for other ideas, which could be better. The allure of current business practices also limits search (Pettigrew 1985; Van de Ven et al. 1999). A remedy is found by making minor adaptations in current business practices. Because past use appears to offer a field test, such adaptations seems cost-effective (Hart and Bogan 1993: Mintzberg and Westley 2001). Only one in five decisions studied conducted a search or sought innovative ideas.

Best practice makes a commitment to uncover several options and at least one with innovative features. Search can be carried out using repeated solicitation, integrated benchmarking, or innovation. Repeated solicitation recursively gathers ideas from outsiders. Integrated benchmarking visits high-profile organizations to get ideas and then merges the best features of these practices into a plan. A custom-made remedy calls for solutions new to the organization or solutions that are new to the industry, seeking a "first mover" advantage (Damanpour 1991; Germunden and Hauschildt 1985). Research shows that multiple options are both efficient and effective. The time to search was no greater than that noted when a single alternative was uncovered and the benefits realized more than justified search costs.

### Use Evaluation Wisely

Defending ideas were found to consume most of the resources allocated to making a decision (Nutt 2002). More is spent doing defensive evaluations than on all the other decision-making activities combined. A defensive evaluation is mounted when information is collected to support an idea (Mintzberg et al. 1976: Langley et al. 1997). When evaluation is used in this way, important questions will be ignored. AEP officials determined the purchase price of the village but did little else. Company officials made no attempt to understand the cost of negative publicity or Gavin plant pollution. Analysis was limited to reconciling the purchase price with the market value of the homes, which was used to defend the plan. Such defensive evaluations are feasible only when expected results are vague. Without a clear aim, an idea champion can slant information collection toward justifications, ignoring other issues. In the AEP village purchase decision, the lack of a clear aim lead to a preoccupation with price; this drew company officials away from pollution and liability issues. Instead, information collection was tailored to support what decision-makers wanted to do or must do to satisfy others. Even when decision-makers have the organization's interests at heart, such evaluations will appear self-serving. More evaluations are mounted to deal with suspicions, which leads to new doubts and still more evaluations. This cycle of suspicion and evaluation often grows until huge sums are spent.

Best practice calls for using aims to collect information about the value of alternatives, looking for the alternative that best meets aims as well as risk of each (Nutt 1989). This kind of evaluation is feasible only when expected results are clear. Also, clear aims make a defensive evaluation untenable. In the AEP decision, an aim to minimize costs suggests costing pollution abatement and no abatement options. Estimating the costs produced by taking no action to reduce pollution and the likelihood of incurring these additional costs seem essential but were ignored (Ways to compute the impact of risk in benefit estimates can be found in Nutt (1989, 2002)).

### Confront Ethical Questions

Ethical questions often arise from how a preferred course of action is viewed (Johnson 1993; Bardaracco 1997). AEP officials acted on a real estate deal that brushed aside pollution concerns. This raised ethical questions for both company insiders as well as outsiders. Opposition materialized when these questions were dismissed.

Ethical questions also arise when values are misunderstood (Nutt 2002). Misunderstandings develop because critics seldom reveal the values prompting their questions. AEP officials saw objections to the village purchase as stemming from failing to appreciate the challenges in

keeping power flowing. To make this point, AEP officials postured to look like a victim. The prospect of being seen as a villain was never considered. Note how both critics and AEP officials failed to disclose their values: the values of key insiders and outsiders were not apparent to one another. Problems arose when parties to a decision fail to understand the values motivating questions. Dismissing such questions can prompt whistle-blowing by insiders and contentious relationships with outsiders. Outsiders who oppose an action are enticed to boycott products and insiders are motivated to leak or to engage in whistle-blowing. Even if boycotts and whistle-blowing are avoided, there is a loss of trust that can taint future dealings.

Appearances can create inequities that also pose issues. Opposition is apt to emerge when there is a misalignment in who pays, who benefits, and who decides (Nutt 2002). AEP officials wanted to avoid paying for pollution abatement while they benefited and decided. Issues develop when critics expose the misalignment, creating controversy.

Best practice calls for uncovering the values behind ethical positions. Uncovering value-based differences among key stakeholders allow a shift in discourse from the lowest to the highest denominator. Ethical questions are resolved by finding actions that embrace all values key stakeholders believe to be crucial. To do this, create forums to identify ethical questions as claims and alternatives are uncovered. The forum allows decision-makers to look for values behind the positions of people who express opposition. A decision-maker can often affirm these values and make minor modifications in a claim or a preferred course of action and carry on much as before. Had AEP officials affirmed the values of the groups that questioned them in the media by addressing pollution issues, they would have cut the ground from under their critics. AEP could have listened to residents to find out what they were after. Had the values of pollution abatement been affirmed and endorsed, AEP officials could explain their plans (if they had any) and perhaps get backing for them. If this fails – offer mediation. Company officials could have held hearings or town meetings to find out what their critics were saying, looking for unwarranted criticisms and misunderstandings that could be diffused. At best, new insights can develop. If not, AEP officials would have demonstrated a willingness to hear out their critics – a position that is apt to boost the legitimacy of any subsequent decision. Companies with mediation win lawsuits involving whistle-blowing. Companies without it lose them.

Align who pays, benefits, and decides. Had AEP officials allowed critics a voice in the decision, such an alignment was possible. Company officials contemplating a buy out of the village could share decision-making with the villagers and with regulators to realize the desired alignment.

### Promote a Culture of Learning

Learning is required to identify decision-making practices to avoid and those to embrace. Learning was thwarted when organizational leaders insisted on success (Nutt 1989). Because decisions fail more often than leaders realize, decision-makers in a "no-failure" environment find it rational to conceal their actions (Nutt 1999). This hides information essential to learn. AEP officials fainted surprise when critics mounted a national expose. This prompted them to label their critics "utility bashers," saying little about what had prompted their village purchase.

Decision-makers who can be held accountable for a failure find themselves in a no-win situation. Some failure is inevitable, but there is no tolerance for failure. There are but two options: own up or cover-up. An own up makes the day of atonement today; a cover-up makes it tomorrow and, with some luck, never. Put in this bind, it is rational to hide one's actions. This creates even more trouble because several acts of deception are now required (Nutt 1989, 2002). Offsetting bad news with good news sidetracks threatening questions. The cover-up is two tiered: the distorted good news and the creation of misleading information. These games of deception become "undiscussable" because to reveal them would also reveal the "lose-lose position" that has been created (Argyris and Schon 1978). There is a cover-up of the cover-up to cover one's tracks, making key decision-maker actions undiscussable.

Like many debacles (Nutt 2002), AEP officials blinded themselves to bad news. To create good news in the aftermath of massive PR debacle, AEP officials insisted their actions were prudent. They issued press releases to defend the village purchase that ignored pollution problems and associated law suits and touted their success in keeping power flowing. At this point, how the village purchase decision came about was not discussable. AEP continues to believe that their village purchase was justified and have yet to connect it with the company's subsequent string of failures in securing federal grants, rate negotiations, court rulings, and coal plant construction plans.

The culprit here is a perverse incentive that requires success when some failure is inevitable. This makes it difficult for a decision-maker to come forward with insights into what happened and why (Nutt 2002). Decision-makers in the AEP case took defensive action, saying nothing about practices and actions that contributed to failure, which is essential for learning. To eliminate such a perverse incentive, organizational leaders must demonstrate that it no longer applies. Show that that some failure is inevitable and that the organizations only interest is to determine what does and does not work, not to assign blame. Blame is useless. After a "guaranteed success" perverse incentive is rooted out, a quest to uncover failure-prone practices can be undertaken.

## Conclusion

Research has uncovered successful and unsuccessful decision-making practices. This chapter translated these practices into steps to take and steps to avoid in a decision-making process, identifying best practices for successful public sector decision-making. Best practices call for allocating resources to validate claims, implementation, and direction setting at the forefront of a decision-making effort. These process steps guide search and evaluation, which follow. Dealing with ethical issues and learning from successes and failures were also essential.

This suggests that successful public sector decision-makers must uncover claims that capture the views of a cross section of important stakeholders, seek hidden concerns. Identify the claims of regulators, clients, suppliers, oversight bodies, the media, and others that may have insights. Amalgamate the claims from such sources to identify the range of claims that are plausible. The concerns behind these claims suggest what the decision is about. Best practice implementation brings social and political issues to the forefront by uncovering the interests of those who can block action. Opposition can be expected when these interests are threatened. Use participation when interested parties are localized and intervention when interest groups are diffuse. Aims specify expected results and direct a search for remedies with desired results in mind.

These steps clear the path for search and evaluation, making each easier to carry out with less controversy. An aim-directed search increases the chance of being successful no matter what search approach followed. Aims discourage defensive evaluations, shifting analysis to determining the benefits of several alternatives and the risk in realizing them.

Ethical questions arise from a misalignment in who pays, who benefits, and who decides as well as a failure to appreciate key stakeholder values. Aligning who pays, benefits, and decides as well as reconciling value-based differences of key stakeholders' points to actions apt to gain support. Learning helps one find what worked, what did not, and why. Perverse incentives complicate learning by hiding information needed to make such assessments.

## Organizational Demography

Sanneke Kuipers, Kutsal Yesilkagit and Brendan Carroll
Faculty of Governance and Global Affairs, Leiden University, The Hague, The Netherlands

### Synonyms

Mortality; Organizational survival; Structure of government; Termination

## Definition

Termination: An organization is considered terminated if it is fully abolished, merged with another organization, or split into different autonomous new entities.

Transition: An organization experiences a transition if it is either terminated, absorbed by another organization, or succeeded by another organization with a new name, at a new level of operation, or with other new structural characteristics.

## Introduction

Do bureaucracies become immortal beyond the control of elected politicians, as popular wisdom (or fear) often suggests? Since Herbert Kaufman (1976) started to investigate this very question, a new strand of research has emerged to study the demography of public organizations, somewhat in line with population ecology approaches in the business literature. Scholars on both sides of the Atlantic studied the transformation of government by looking at the creation and termination of public organizations.

The studies on survival of public organizations agree on one aspect. Public organizations are far from perennial. Scholars arrive at the same conclusion regarding a diversity of public sector populations: over time, most public organizations perish. Their explanations vary, ranging from factors such as limited public resources, elections and turnovers, liabilities of newness, adolescence and obsolescence, and the institutional "hardwiring" of individual public organizations.

Studies on the demography of public organizations seldomly build on each other, as is customary for business administration studies in the population ecology realm. In particular, disagreement over definitions of organizational termination continues to divide the debate on organizational survival in the public sector. As if during an autopsy, different doctors arrive at different conclusions on the cause of death whereas a third one claims the patient has not died at all.

The following sections provide an overview of current insights, including the disagreements, on public organization survival. Two strands of research emerge: (1) institutionalist theories with a more "dichotomous" definition of termination and (2) those using public choice-oriented theories that consider a fine-grained range of political interventions on public organizations.

## Politics and Legacies

### Two Perspectives on Termination

What constitutes survival and termination of public organizations, really? In the field of business administration there seems to be little discussion on what is survival and what is not. Simply put, an organization is either in business or it is not. This lack of ambiguity in business literature allows for a dichotomous definition and "biological" metaphor in studying the mortality of government organizations, referring to the "mortality," i.e., "life" and "death," of organizations. The "population ecology" approach even sees competing organizations in a given area as a "species" that can be studied to explain firm mortality and organizational founding, as well as population growth and change. Ever since Kaufman (1976) adopted the biological metaphor 40 years ago this ecology idea has been applied increasingly on populations of public sector organizations as well.

Yet studying termination of public organizations defies such a strict, dichotomous definition of what constitutes survival. Being "dead" or "alive" in bureaucracy is not a dichotomy. Policies carried out by public organizations do not often come to a definite end. In fact, bureaucratic organizations and the policies they implement seem to undergo constant structural reform. This reform drive blurs the distinction between termination or continuation in a dressed up (or down) version.

The reorganizing capacity of political executives is what makes public administration and business administration such different fields. Public organizations do not only perish because other organizations outrivaled them in securing essential resources. Political executives can deliberately axe public agencies or deny them funding

for ideological or electoral reasons. This difference matters for both termination definitions and their implications. In the study of the survival of public organizations, different perspectives on politics and administration have led to a considerable fragmentation of insights.

### The Political Control Approach

The political control perspective implies that structural changes to public organizations are first and foremost political acts. The observer – from a political science background presumably – has an interest in studying political control over the structure of government, from the perspective of the principal. Each political act deserves similar attention, ranging from subtle name changes of organizations to fully fledged abolitions. From this perspective, biological metaphors and dichotomous definitions make no sense.

The political control approach tends to define most political interventions to public organizations as termination and (re-)creation. These changes not only reflect what happens to the public sector, above all they constitute important political acts representing political control over the public sector. It is important that no changes go by unnoticed because ignoring name changes and other events such as change of superior organization may mask important discontinuities. The subtle variety includes different "termination types," such as termination by change of name, form, level, or acquisition of activity.

In this perspective, even the least pervasive event (name change) reflects a significant act of political control over a public organization. For instance, the Dutch government decided to name the Air Traffic Security the Air Traffic Control Netherlands from 1998 onwards. "This name change signals an outward and transboundary approach to air traffic control. ATC has long been a domestic issue, but increasingly became a joint European and global responsibility – an evolution reflected in its name change. Though the agency continues as an organization this event can be interpreted as a termination of its previous form, and a start of a 'new' phase in a new form" (Kuipers et al. 2017). Seemingly small changes still represent a discontinuation of "key structural features." The political control perspective identifies such a discontinuation or structural change as an "event," implying some form of termination.

### The Institutional Legacy Approach

The contrasting approach implies that changes in the structure of government are the consequence of the fact that public organizations have their own interests (probably continuation). The public organization adapts to its environment and sees political interventions as a necessary evil that becomes part of the legacy to be carried into its future. The organizations themselves take center stage and their study – from a public administration or sociological institutional background – focuses on what organizations do to strike root, survive, and prosper. Biographical accounts of the rise and demise of particular organizations go hand in hand with life and death metaphors.

The institutional legacy approach would therefore advocate a more dichotomous definition of termination instead of the subtle variety discerned by the political control approach. Organizations only perish when they cease to exist in any form. All other events in the life of a public organization are forms of adaptation, perhaps even on its own initiative, in its struggle to survive. For instance, the Tennessee Valley Authority rose from an organization created to protect the region against flooding and soil erosion while at the same time exploit hydroelectric power, to a nuclear power house 50 years down the road. The New York Port Authority born out of an interstate conflict about railroad freight rates was a seriously underfunded attempt to increase economic cooperation on both sides of the Hudson River. It turned into an engineering and transportation powerhouse, responsible for harbor and airport development, bus and truck terminals, in addition to building bridges and tunnels. Institutionalists focus on how public organizations form their mission from the moment of their inception and how the legacy that the organization built over time becomes the seeds of its eventual demise. The political control approach above would instead dissect the life of

the TVA or the Port Authority in different durations for "different" organizations, whereas students of institutional legacy emphasize the integrity of the institution, adapting over time.

### Different Perspectives Relate to Different Research Designs and Methods

Institutional legacy arguments require comparative case studies instead of large N studies on populations. Case studies allow for a definition of termination that depends largely on the judgment of and substantiation by the researcher. The researcher builds an argument and in turn provides the reader with ample substance on each case heuristically to validate the argumentation. Yet even some large N studies take the organization and its institutional legacy as vantage point. They discern "maintenance," "succession," or organizational change categories as a go-between life and death. These studies use comparable definitions, but they do not explain events. Their distinction between terminating events and maintenance events does, in spite of their large number of observations, not allow for regression analysis and event history modeling to generate statistically robust explanations.

The political control studies employ large N statistical regressions. In order to find out which political factors influence survival, authors employ event-history analysis to explain "termination" events. The method does not tolerate categories between life and death, so most changes in the organizational structure are considered a termination event. Yet even studies that do statistically investigate the factors that affect survival use different definitions implying that their findings have a different base, and as such they do not add up in a meta-analysis.

The more studies focus on organizational characteristics as a theoretical explanation for survival, the more they tend to use dichotomous termination definitions that imply stability. Those studies that see political control as the main survival explanation focus on events indicating organizational discontinuity. The next section presents an overview of the most important factors and findings from current studies to construct a model of organizational survival.

## Organizational Survival in the Public Sector: Towards a Model

In spite of their disagreement on definitions of organizational termination, this section compares the results of existing studies on survival of public organizations. The result is a theoretical model of determinants of organizational survival and overview of common findings and disagreements in existing research. This section first introduces the hypotheses and ends with a summary of findings.

Three categories of factors seem to matter in the literature on survival of public organizations: (1) demographic explanations centering around the age of the organization, (2) design explanations implying that "birth characteristics" of organizations will influence future survival chances, and (3) contextual or functional explanations that reveal why some public organizations survive changes in their environment as opposed to others.

The perhaps most prominent and oldest factor of interest to students of organizational survival is the age of the organization. Common wisdom holds that organizations tend to survive infinitely after they reached maturity. Empirical studies demonstrated that an organization's survival chances do not monotonically increase with age, however. New organizations are particularly vulnerable because they have not been able to nest themselves and their routines sufficiently in their environment. In their early years, political volatility or growing pains may be fatal to the budding organization. Also, particular vulnerabilities can arise for the riper organization: obsolescence becomes a threat when an organization's functionality cannot keep up with changes in their environment (think of a steamboat inspection service, or a firm such as Kodak) or when their mission has been accomplished (fighting polio). If organizations' hazards increase both when they are very young and very mature, the survival chances of an organization would resemble an inverted U-curve.

In between, the hazards of the juvenile organization may increase. In its infant years, when its legislative support base has just been established and its proponents are still in office, the organization can develop relatively unharmed. More than a

decade down the road, the organization has sufficiently secured its resources and support base to fend of competitors and opponents. However, in the in-between period, the organization's hazards rise because the protective shield of its creators may have diminished, and it becomes vulnerable to termination efforts by its opponents. Also, during the organization's adolescence, legislative actors have had time to learn about the organization and its accomplishments or performance (Carpenter and Lewis 2004). This learning may result in the increased likelihood of fatal critique and termination. Each age effect results in a different hypothesis related to survival.

H1. *A public organization is less likely to survive in the first 5 years after creation (liability of newness). After 5 years the termination chances of public organizations decrease.*

H2. *Public organizations are more likely to be terminated in their 'adolescent' years (>5 <10).*

H3. *A public organization is likely to become obsolete at some point and thus faces increased hazards when it has reached a mature age (>30).*

Second, organizational survival in the public sector can be explained by looking at the agencies' "birth characteristics" or "DNA." Some organizations simply have a stronger design, they are "hardwired" for survival. Hardwiring theory especially dominates in political science, where organizations are seen as embodiments of political interests. Political science intrinsically links the acts of organizational change to legislative-executive decision-making. Instead of the invisible hand that weeds out some organizations in a population, public sector organizations sometimes face very visible opponents. Politically informed "attacks" on bureaucracy are predictable, so creators try to "hardwire" their organizational offspring into survival. The effects of institutional design result in the following hypotheses:

H4. *Organizations established by formal law have higher chances of survival than organizations established by decree.*

H5. *Organizations set up at arm's length of government have higher chances of survival than organizations that operate in the hierarchy of a ministerial department or executive office.*

Another product of intentional hard wiring is the organization's internal structure. Organizations' structural traits such as whether they are governed by a board or not (single administrators) could also have an impact on survival.

H6. *Organizations governed by a board are more likely to survive than organizations governed by a single administrator.*

An increasing number of termination studies have included the organizational "type" (advisory, regulatory, executive) as a factor of influence. Two types that stand out in the literature (advisory and regulatory versus the rest) are both included here. The distinct hypotheses reflect that the assumed influence on survival differs.

H7. *Advisory organizations have less likely to survive than other types of public organizations.*

H8. *Regulatory organizations have higher chances of survival than other types of public organizations.*

Some organizations are intended to be terminated from the start. Their "sunset clause" specifies when, or under what conditions, the organization will be abolished.

H9. *When organizations are created with a sunset clause, they are unlikely to survive that clause and mature into 'old age' (>average).*

Third, termination studies on public organizations usually control for political and economic indicators. The general expectation is that turnover is likely to affect survival of organizations in a negative way because incoming elects will probably attack the creations of their predecessors. In addition, a rightwing government will probably aim to downsize the public sector. Economic indicators also serve as an

important control: when government revenues go down, it seems less inclined to spend resources on upholding public organizations. The opposite effect may also hold: recession makes incumbents unwilling to dismantle government organizations unlikely because in the short run this will increase unemployment.

H10. *Political turnover negatively affects survival of public organizations*.
H11. *A right wing (majority in) government negatively affects survival of public organizations*.
H12. *Incumbency of a political executive of another political color than the organization's creator (so-called 'unfriendly government') negatively affects survival of public organizations*.
H13. *When total government revenues decrease, the likelihood of survival of public organizations decreases as well*.

The next section provides an overview and discussion of the actual impact of these factors on organizational survival according to a set of recent studies.

## Comparative Findings

Section three has not yet revealed how these factors fared in empirical analyses on the public sector. The table below presents the findings from the studies reviewed for each of the hypotheses above. Positive relation to survival is indicated by a "+" and a negative effect on survival by a "−." So a "+" for newness does not mean that the liability of newness is confirmed, but that newness has a positive effect on survival. A tested but inconsequential factor is indicated by an "x" and the "U" stands for nonlinear effects (for instance, insulation from presidential interference is a liability in the first 6 years of an organization's lifespan but protects it in the long run; see Boin et al. 2010) (Table 1).

According to this overview, on average 54% of the cases perish during the period studied, about 1.5% of the studied population annually. This result officially debunks the myth of immortality. The varying time periods of the studies require us to temporalize the results. The comparably high percentages of 52% (Boin et al. 2016) and 58% (Greasley and Hanretty 2016) become very different termination rates when divided by the number of years of the studied period.

Nine factors seem to have a significant unidirectional effect on survival. Old age increases survival chances (H3), and so does a regulatory function (H8), and a firm legislative base (H4). Adolescence (H2) is a hazard, but different explanations rival for this effect. Advisory organizations (H7) are more likely to be terminated and, not surprisingly, this also goes for organizations set up with a sunset clause (H9). Political turnover most likely negatively impacts the survival of public organizations, because new political executives tend to reorganize the administration (H10). Unfriendly incumbencies (i.e., political executives of a different political ideology – H12) are likely to terminate the administrative agencies their political opponents previously created. Rightwing incumbencies (H11) often have negative effect on survival.

The incumbent government's ideology can also interact with other factors. Götz et al. (2015) point out that leftwing incumbents tend to be less likely to terminate administrative organizations, unless pressure for budgetary austerity increases (factors 11 and 13). Likewise, Greasley and Hanretty (2016) conclude that public organizations' termination hazards increase under rightwing governments in "normal" times (low to moderately high budget pressure). When public debt increases, organizations face higher termination risks under leftwing rule. Greasley and Hanretty additionally argue: "the effect of greater-than-average debt on agency termination is negative for very young agencies, and for older agencies, but positive for agencies in their third to seventh years" (p. 168). So leftwing incumbencies under economic strain are most likely to target adolescent agencies for termination (which fits with our hypothesis 2).

Surprisingly, the effects of economic downturns also point in other directions. Carpenter and Lewis (2004) challenge conventional wisdom with their finding that budgetary pressure

decreases survival chances for public organizations (H13). In fact, their budgetary surpluses increase the hazards, and deficits make terminations less likely. The short-term cost of organizational termination would make such decisions unfavorable in times of austerity (Carpenter and Lewis 2004, p. 222). By contrast, James et al. (2015) found that budgetary pressure increases termination hazards whereas Park (2013) and Boin et al. (2016) tested the same factor but found no significant effects.

Insulation from executive interference (arm's length status – H5) can make organizations more likely to survive than those created in proximity to the President, but not all studies agree (Lewis 2004 vs. Boin et al. 2010). Disagreement also exists regarding newness (H1): being green can both help the organization to survive and prove to be a liability (see Table 1).

## Conclusion and Future Research

Explanations for the survival of public organizations abound. This chapter offered an assessment of each potential factor by comparing different research findings. The factors that were confirmed in several studies could together form an integrated model of organizational survival in the public sector. Such an integrated model would predict that regulatory tasks, creation by law, and being older than 12 years makes organizations most likely to survive, but by no means hazard-free. In any case, hazards for public organizations increase when political winds change and new incumbents enter office. Rightwing executives may be more likely to terminate public organizations in normal times but beware of the leftwing executives under budgetary constraints. Such an integrated model could best be tested on large N datasets by using event-history analysis. Revealing underlying mechanisms, discovering new variables, and explaining outliers would benefit from a case-oriented study, as advocated within the institutional legacy approach.

To enrich future discussions on organizational survival and transformation of the public sector, it seems imperative to abandon the binary definition of organizational termination. Instead, a focus on "transitions" would help to build on the diversity of existing research and allow for more analytical leverage. The word "termination" implies a definite "end" of a period in which an organization took on a particular form. Meanwhile the organization itself did not end. The preferred, more neutral term "transitions" refers to beginnings and ends of phases through which organizations evolve. Such transitions are both dependent variables in their own right and explanatory factors for survival – a great number of sudden transitions could be a prelude to full termination, or the total absence of transitions could indicate an ultimately fatal condition of rigidity. A sequence of transitions could reflect a pattern of staged adaptation to changing resource levels (Levine et al. 1981). The total sum of transitions of individual organizational units reflects a transformation of government.

Transitions pertain to all the structural changes to the organization that can be measured consistently and reliably over time, such as changes to the organization's name, superior organization, hierarchical level, status as staff or line unit, structural autonomy by law, as well as mergers, splits, and abolishments. This approach allows building both on existing datasets for event-history analysis and on studies that use a dichotomous definition of survival. Coding all detailed changes as events allows for multivariate regression analyses and statistical explanations on survival in the public sector. The compatibility to institutional legacy studies is enabled by the possibility to discard more subtle transitions such as name changes in the dataset in order to study long institutional durations only interrupted by more definite passings such as mergers or splits.

Important steps have been made in studying the transformations of public organizations individually and the state in total, since Kaufman started his study on organizational mortality in 1976. However, today many studies on survival in the public sector focus only on independent

agencies, in majoritarian political systems (cf. Park 2013; Greasley and Hanretty 2016; James et al. 2015; Bertelli and Sinclair 2016; Boin et al. 2016). Rich harvest is waiting in a demographic study of both autonomous agencies and bureaus within national ministries in continental Europe. Such populations would allow for systemic comparisons on the vulnerability of autonomous versus embedded public organizations and the effects of institutional design between majoritarian and consensual systems. Additionally, policy preferences in coalition governments probably affect administrative reform and organizational termination in a different way than in single party governments. Building on findings of Götz et al. (2015) and Greasley and Hanretty (2016), future studies could probe into the effects of political ideology under different circumstances or for different organizations. There is much to gain from a study on the relation between policy agendas (the Comparative Agendas project), policy preferences (the Manifestos data on electoral programs), and the structure of government in different policy areas.

Empirical research has now established that public organizations do perish and that organizational design can serve as a shield against termination hazards. Future studies need to probe deeper into how specific political power plays and particular policy preferences impact the structure of government.

## Definition

The system of external factors and other organizations with which organization leaders must interact; includes response strategies for external pressures and threats, acquisition of resources essential to core organization functions and programs, and pursuit of opportunities to strengthen overall organizational performance.

## Introduction

The study of public organizations includes analysis of what lies beyond their formal structures and internal operations, particularly how organizations are shaped by external factors and how they interact with other organizations and institutions. At the most fundamental level, the core tasks and responsibilities of public organizations are shaped by institutional actors in the political environment. This means that activities such as public policy implementation, government program delivery, and agency regulatory enforcement include principal-agent interactions. In fact, the broad-level political environment of public organizations is a long-standing subject of introductory government textbooks along with advanced scholarly theory and research on government bureaucratic politics and policymaking.

Public organizations also can be studied as complex sociopolitical-economic systems, in which the focus is not only on classic administrative processes and procedures within the organization (e.g., human resource management guidelines, collective bargaining agreement processes, and financial management control systems) but also on how organizations engage in multifaceted interactions with their environments. The focus on organizational environments means identifying and assessing external factors that may have implications for organizational performance in carrying out missions and working toward goal achievement. Organization theorists present environments as both constraints and contingencies which administrative leadership must understand and negotiate. These constraints and contingencies include governmental institution actions such as budget appropriations, executive orders, and court rulings; levels of political support from elected officials, the public, and key stakeholders; and socioeconomic conditions such as demographics, ideological orientations, and the state of the economy.

The very existence of organizational environments points to the utility of the open systems approach which had emerged as a central paradigm of policy and administrative studies by the mid-twentieth century. An organizational environment, taken as a whole, may be characterized through a wide range of variables; these variables facilitate identification of different types of environments and their underlying properties. Common variables used include complexity, uncertainty, stability, heterogeneity, concentration, resource scarcity, and even turbulence; organizational environments may land at different points on these key system variables.

## Organizations and Their Environment

A foundational question for organizational environment analysis is the primary unit of analysis. Should it be the organization itself as it interacts with its environment? Or should the primary focus be the larger organizational environment as a system? While these approaches are not mutually exclusive, they nonetheless require preliminary consideration. Studies of how organizations may adapt their internal structures and activities in response to the environment reflect the focus of

the first question, i.e., the organization itself as the primary point of departure. In analysis of an organization's interaction with the environment, a question explored might be whether a relatively stable, certain, and undemanding environment may lead to an organizational response such as development of a more traditional, hierarchical management system. Or is a decentralized, loosely coupled organizational system more likely to emerge in a rapidly changing environment? Do environmental demands shape the administrative, managerial, and service delivery technologies used by organizations in processes such as planning, marketing, and program delivery? Questions such as these have figured prominently in contingency theory, which focuses on how organizational properties and processes such as structural design (e.g., mechanistic or organic systems) and centralization/decentralization of decision-making may be shaped by environmental factors. One of the most frequently cited contingency theory studies embodies this approach by investigating impacts of changing organizational environments on whether administrative leadership makes adjustments to key internal organizational elements such as structural differentiation and integration mechanisms (Lawrence and Lorsch 1967).

Along with structural adjustments, organization leaders may respond to changing environments through a response set generally identified by organization theorists as adaptation. Miles and Snow's (1978) adaptive cycle for organizational leadership, although primarily focused on business firms and the private sector in general, has implications for the public sector and contemporary studies of organizations in their environments. They identify four major types or organizational responses to environmental changes, with three of the organizational strategies more or less effective for organizations seeking to adapt to environmental challenges. On the positive side, there are organizations focused primarily on defending core programs and activities (defenders), those prospecting for new opportunities (prospectors), and those exhibiting strong analytical orientations (analyzers). On the negative side, there are organizations whose leaders react to their environment (reactors), and these organizations are headed toward compromised performance and perhaps even failure.

## Organizational Strategies Toward Coping with the Environment

Interest in adaptation strategies by organization leadership extends across a wide swath of organizational environment studies, including coping strategies by organizations seeking to protect themselves from uncertainty in the environment. While relatively stable, resource-rich and supportive organizational environments may exist, they also have the potential to be unstable and not particularly hospitable, posing threats that undermine organizational capacity for carrying out core responsibilities and delivering services to their clientele. In a worst case scenario, agency or program survivability may be jeopardized or imperiled. This subject brings in one of the foundational concepts of organizational environments, organizational domain (e.g., Thompson 1967).

Domain covers wide conceptual and empirical territory, from programmatic activities through the mix of clients served by the organization. The general perspective is that organizations as rational, self-interested actors will seek to protect their core domain. Doing so is seen by organizational leadership as vital to mission, purpose, and task achievement – and for that matter, the essence of how an organization is defined and cultivates its support and perceived legitimacy. For example, budget cuts represent a challenge or threat to public organizations since they likely will undermine agency capacity to serve clientele (e.g., a social service agency and its antipoverty programs). For another scenario, an agency may have its service delivery jurisdiction expanded (i.e., its domain widens) to the point that overall performance is significantly eroded because staffing and financial resource capacity get stretched to their limits. On the other hand, agency administrators may fear domain shrinkage and all that implies for resources such as staffing, funding and legitimacy, and the potential for policy

impacts (e.g., a regulatory agency whose oversight jurisdiction has been circumscribed by legislators).

The survivability concept is important in considering organizational environments, even though a commonly voiced perception is that the public sector rarely includes organizational or program demise as a scenario. The survivability concept, however, does apply to the public sector, particularly at the state and local levels. For example, while school consolidations and closures may occur for different reasons, environmental stresses such as substantial decline in student enrollment, erosion of local property tax bases, and pressures from state education departments have played a role in the long-term reduction of the number of public K-12 school districts. In addition, contemporary challenges to public education posed by market-based reforms such as vouchers and charter schools, including key federal and state officials promoting such privatization options, present a whole new layer of environmental challenges for struggling public schools. Public schools show that effective public organizational leadership includes environmental scanning, not only for opportunities but also for threats. The nonprofit sector, which increasingly is being called on to deliver essential public services such as mental health programming and assistance to people with disabilities, also faces a similar set of organizational survivability challenges, mostly due to governmental funding uncertainty and decline. As a result, nonprofits in the face of resource challenges due to declining or uncertain governmental funding increasingly find it imperative to explore strategies such as mergers, alliances, and strategic appointments of board members, otherwise known as cooptation (Malatesta and Smith 2014).

Strategies to cope with environment pressures come under the general rubric of how organizations align with their environments. While cooperative strategies such as contracting, coopting, and coalescing are explored by Thompson (1967), and Miles and Snow (1978) make the case for defending, prospecting, and analyzing, the adaptive strategy that has received probably the most extended attention is buffering. The buffering strategy is evident in both generic and public organization theories, and it refers to steps an organization takes to shield or insulate itself from negative environmental impacts or at least to mitigate or lessen the impacts. Organizations that buffer are seeking to protect themselves from major disruptions or shocks in the supply of essential resources, such as budget appropriations, grant funding and political and stakeholder support. Proactive administrators may attempt to buffer their organizations in a variety of ways. For example, they may seek to stabilize or enhance their capacity through strategies such as assembling slack resources, developing interorganizational relation networks, and implementing changes in organization structure and management activities (Lynn 2005; Meier and O'Toole 2008). Meier and O'Toole's research on buffering directly relates to the present focus, since they study buffering activities undertaken by public organizations, specifically public schools in Texas.

## Properties of Organizational Environments

Organizational environments themselves merit analysis, including as a way of understanding critical tasks and challenges that face organizations. Dess and Beard (1984) argue that organizational task environments vary according to their munificence, dynamism, and complexity. The munificence concept measures the availability and abundance of resources in the environment (e.g., revenue capacity and grant funding support). Dynamism measures change patterns in the environment, particularly the stability of any changes. Complexity measures the variety and range of activities involved as an organization engages in core programmatic processes. With Dess and Beard's typology in mind, discussion turns to three important dimensions of organizational environments – resources, turbulence, and complexity.

External resource availability is critical to organizational health, and this is a central point of resource dependence theory, which joins contingency theory as an equally important

framework in organizational environment studies. Resource dependence theory argues that organizations are involved in active, ongoing transactions with their respective environments as they balance the quest for both autonomy and managerial discretion with power that may be exercised by external organizations and institutions possessing critical resources (Pfeffer and Salancik 2003). These critical resources may be financial/economic (e.g., appropriations, grant funding, revenue allocations, and tax sharing) along with others such as approval of personnel lines, new program authorization, and stakeholder support. They also increasingly entail complex relations between public and nonprofit sector organizations (Fyall 2016). From an individual organization standpoint, an overriding goal is reduction of dependency on the environment for needed resources, but achieving this requires ongoing negotiation with the environment and strategic use of managerial discretion. Some degree of external control over organizational resources is the condition of organizations, whether public or private, and the challenge for administrators/managers is to effectively respond to and manage patterns of resource dependence. This is particularly important since other organizations in the environment may be problematic or questionable resource providers for reasons that include unreliability, uncertainty, and efforts to use resources for power or control purposes (Pfeffer and Salancik 2003).

Organizations unfortunately may find themselves in an unusually difficult environment, one with turbulence. During the 1960s, significant socioeconomic and political changes led to emergence of the turbulence concept to help understand challenges facing many organizations, in both the public and private sectors. What if the environment changes not only rapidly but unpredictably? If the environment is turbulent, rather than just changing with rapidity, how do organizational leaders and policymakers respond? And what if the environment not only is changing rapidly and unpredictably but also substantively or with great impact? The environmental turbulence concept has become one of the mainstays of contemporary public administration studies (e.g., Boyne and Meier 2009; Hahm and Jung 2013), and examples of turbulent environments are readily seen in policy areas such as public higher education, urban law enforcement, government pension systems, health care, and even election administration.

Environmental complexity adds to the challenges of contemporary public administration. For public organizations, environmental complexity is all too evident, readily seen in programs with features such as extensive legal and procedural requirements, numerous decision points, competing or contradictory goals, and required collaboration with other organizations in service delivery. In many ways, environmental complexity for public administrators has increased, with this complexity certainly evident in intergovernmental policy areas such as poverty assistance, elementary and secondary education, and environmental regulations.

## Conclusion

Organization theorists have paid close attention to environments for the simple reason that they matter for administrators, managers, and employees along with program clientele and beneficiaries. Organizational environments provide both opportunities and threats, with the latter overall representing the most pressing challenges for organization leadership. Effectiveness in organizational leadership means not only attending to managerial processes internal to the organization but operating in an open systems context in which the fate of the organizational domain is affected by a wide range of external factors, from shifts in legislation, budget appropriations, and judicial opinions through the state of the economy, the health of revenue systems, and stakeholder support. All of this necessitates proactive organizational strategies; these strategies include active scanning of the environment, buffering the organization against unexpected developments, and dealing with conditions such as resource uncertainty or scarcity, environmental turbulence, and complex policy requirements.

Knowledge of organizational environments is critical to contemporary public administration and

policy and particularly in three areas. First, organizational environments figure prominently in networks and networking, since networks by definition bring public administrators into varying degrees of complex interactions and relationships with other organizations and their administrators and advocates (e.g., O'Toole 2015). Second, a growing reliance on the nonprofit sector for delivery of public services, particularly in social and human services, presents a rich set of opportunities for exploring organizational environment questions. This area becomes even more nuanced when privatization developments are included, such as public education competing for enrollment with charter schools. Finally, revenue uncertainty and scarcity coupled with ambivalent and contradictory public attitudes toward government taxation and spending result in ongoing interest in the questions posed by resource dependence theory.

# Organizational Ergonomics

S. Mackenzie Glander-Dolo
Upper Iowa University, Fayette, IA, USA

## Synonyms

Human factor; Organizational ergonomics; Participatory process; Systems theory; User-centered design

## Definition

Ergonomics and the human factor subdivision into organizational, physical, and cognitive (though none functions in isolation) is more recent with the overarching systems ergonomics focusing the theoretical background. The International Ergonomics Association (IEA 2016) definition is "the scientific discipline concerned with the understanding of the interactions among humans and other elements of a system, and the profession that applies theoretical principles, data, and methods to design in order to optimize human well-being and overall system performance."

## Introduction

The human interface with their tools and environment (Mumford 1963), like chairs or cars, has been largely discussed. More recently the focus shifted to how people work in organizations and the mental processes that contribute to procedural adaptation.

In case of "chicken or the egg" (Fig. 1), the technology, environment, and society interchange is a complex symbiotic one. The ideas and needs that society has have driven inventions and agendas that further technological development. The two are inexorably intertwined. Orlikowoski (1992) points to technology as potentially modifiable throughout its use. The structurational model of technology comprises the following components: (i) human agents – technology designers, users, and decision-makers; (ii) technology – material artifacts mediating task execution in the workplace; and (iii) institutional properties of organizations (1992, p. 410, Fig. 2 below). Taken together as a system, agents, technology, and institutions play a complex game of change.

Organizational ergonomics then is concerned with the socio-technical systems optimization (Trist & Emery – Tavistock Institute), including their organizational structures, policies, and processes, especially risk management (ISO 3100). Relevant topics are work design and systems, resource management and working times, teamwork, participatory design, community ergonomics, cooperative work, virtual organizations, telework, communication, and quality management (IEA website).

## System Ergonomics

### Background

Taylorism or scientific management approach (1911) long ruled organizations and is still found today. His research focused on job design and task allocation; however, this mechanized the human

**Organizational Ergonomics, Fig. 1** The technology-society interchange

**Organizational Ergonomics, Fig. 2** Structurational model of technology (Orlikowoski 1992). Used with permission

worker. The First Conference on Scientific Organization of Labour held in Russia in January 1921 brought a change to that as Vladimir Bekhterev, Vladimir Nikolayevich Myasishchev, and Alexander Bogdanov (1913) discussed human work problems. Bekhterev wanted an "absence of fatigue and a guarantee of the sound health and all round personal development of the working people." Bogdanov proposed the input-output model (Belykh 1989), pointing out that "this then creates chains of production which are only as strong as their weakest link" (Moray 2005, p. 21).

Organizational ergonomics history progressed from there:

- The socio-technical systems approach addresses adaptability, complexity, and autonomy in the cycle between technology effects and society's use. Though originally focused on workplace efficiency and design, the computer age shifted to technology integration in the individual's life. The issues remain the same; those interfacing with technology will change and affect the intended design radically.
- During the two world wars, cockpit design (Fitts and Jones 1947; Chapanis et al. 1949) was important. Physical ergonomics was the focus along with factors like fatigue.
- In the 1950s, the business influence was felt focusing on worker efficiency, routines, and quality processes. Theorists like Argyris et al. (1985), Argyris and Schön (1974), Bennis (1985/1961), and Schein (1985) concentrated on organizational development while studies that revealed the Hawthorne effect (Landsberger 1958) progressed the field significantly.
- In the later part of the twentieth century, psychology's influence became dominant in the field introducing psychological empowerment theory that impacted skill and mastery, capacity, heuristics, and created the optimal control model (Kleinman et al. 1970).
- Currently, the focus is on the allocation between human and machine function: research includes highway technologies, NASA's studies, and the adjustments to an increasing older population.
- Present design approaches overlap and follow the ISO standard human-centered design processes for interactive systems (ISO 13407 Model, 1999; Geneva 2000) with audience, purpose, and context or visibility, accessibility, legibility, and language in user-design thinking.

## Systems and User-Centered Design

The words "system ergonomics" are used to indicate a theoretical base for work situation design or redesign. Giddens' structuration theory (1984) identifies three structures in social systems: *signification*, *legitimation*, and *domination*. Orlikowoski (1992, 2000) took Gidden's theory and considered the intersection between structure and use to be the human factor. She replaces the idea of embedded properties in structuration theory (Orlikowoski 1992; DeSanctis and Poole 1990, 1994) for enactment or use.

Society and technology intersection is classically seen in Mumford's *Technics and Civilization* (1963). Mumford shows a society organized not around any organic human needs, but around the "needs" of the machines that have come to characterize and control our lives. Other significant discussions on the intersection between society and technology include McLuhan's (1964) position of technologies' impact on society, and the diffusion of innovation theory (Rogers 1983) looking at the human agents as particular types of innovation carriers.

Today the human work interface includes hygiene and motivation (Herzberg 1968) focus. Campion and Thayer (1985) found job design problems were to blame for inefficiency and went on to create a four pronged approach to job design that included mechanistic, motivational, biological, and perceptual. Work and autonomy meaningfully play a significant role in employee wellbeing preventing turnover and burnout (Lambert et al. 2012).

### Challenges

Challenges that change carries are shown in movies like *2001: A Space Odyssey* (1968) and

*Eagle Eye* (2008). First, machines control human behavior as "The more tools 'seamlessly' facilitate systems development, the more they will be taken for granted, and the more they are used unreflectively the more they will constrain human action" (Berger and Luckmann 1967, p. 62). And second, human actions ruin the technology's potential, "On one Beta project, the consultants found the tools to be particularly limiting and manipulated their access to the underlying computer system in a way that allowed them to surreptitiously bypass the tools" (Orlikowoski 1992, p. 28). The test then is to aim for flexibility and optimize the design and deployment process accordingly. Orlikowski points to a time when the users are "given the discretion, knowledge, and resources to manipulate their technologies" (p. 33). The focus in future development is on the user needs and participation in the design process.

## General Process Methods

When evaluating a system in an organizational ergonomics approach, one considers the following key questions. Using van Scheijndel's (2010) work here modified:

Orientation

- What is the starting point? Who is responsible for what? What will be the project structure? Are there limiting conditions?

Analysis

- System analysis: what is the activities' goal: what must be performed, both in quantities and quality?
- Task analysis: which tasks are required to achieve the goals? Bottleneck analysis.

Design

- Determine a program of requirements.
- Task allocation: which tasks can best be allocated to technology (machines, ICT) and which to humans? Consider alternatives and choose the best solution.
- Tasks and jobs design, including organizational aspects (e.g., education level, training; teamwork; work schedules; flexible solutions).
- Testing in a virtual environment using simulations, mock ups, and models.
- Interfaces design between humans and technology with communication elements.
- Designs adaptations: the global design, followed by the detailed design.

Realization

- Realization: building, implementation. If required, staff training.

Evaluation

- Evaluation: how well does the system do what it should? Here adaptations are considered.

## Research and Design Methods

It is well established that organizational ergonomics reduces costs, improves productivity, quality, and employee engagement, and creates a better safety culture (Groggins ca 2000), but it has taken decades to discover best practices.

Research in organizational ergonomics started with observation and case studies. Numerous survey instruments exist to test stress, burnout, processes, and efficiency. Participatory and action research of worker experience and leader decision-making phenomena show impact on work and its environment. A rather thorough methods' coverage can be found in the *Handbook of Human Factors and Ergonomics Models* (Stanton 2004). The more common ones are:

- Ethnographic analysis
- Surveys and questionnaires
- Focus groups
- Task analysis: Best used early in the design process
- User and methods analysis
- Action research (Lewin 1944) is when the researcher or individuals working with others in teams or a "community of practice" (Lave and Wenger 1991) seek to improve the way they address issues and solve problems (Argyris and Schon 1974). Extra precautions are needed that the researcher is reflexive in the process. Paulo Freire's participatory action research (1982) addressed action in the

educational field and is now applied in all research areas including organizations.

Evidence-based practices have come to the fore and can be readily found online for different fields and from government OSHA sites (see links at the end of this document).

## Participatory Ergonomics

### Background

A user-centered design is based on a user's cognitive preferences as well as cultural needs (Orlikowski 2000, Fig. 3). User-centered design may include participatory design (Abelse et al. 1998), needs, resource, and task analysis, resource analysis and user modeling, and usability testing (Allen 1996; Vrendenburg 2002). User-centered design takes the emphasis off the organization and puts it on the recipients' needs.

Participatory ergonomics not only considers the user but programs maximize worker involvement, as the worker is an expert on his or her job. "The participatory approach to ergonomics relies on actively involving workers in implementing ergonomic knowledge, procedures, and changes with the intention of improving working conditions, safety, productivity, quality, morale and/or comfort" (https://oshwiki.eu/wiki/Organisational_ergonomics). One reason for participatory ergonomics is that many proposed changes are not successfully implemented. Reasons include (Vink and Koningsveld 2010. In English at https://en.wikipedia.org/wiki/Participatory_ergonomics): Workers question why the proposed change

**Organizational Ergonomics, Fig. 3** Colloboration technology-in-practice, Orlikowoski 2000, p. 415. Used with permission

will be feasible, as previous changes were obstructed. No need for change is felt, no sense of urgency. Previous changes had little effect. Proposed changes are simplified, for instance because of budget, and almost ineffectual.

### Participatory Process

Worker participation in the change (Lewin 1946) process allows a sound base for acceptance and successful implementation (Cole et al. 2009). Vink and Koningsveld propose a nine step participatory process (2010). The only differences with the overall organizational process are that with accumulating and selecting ideas, users are involved as well as at the testing stage. A successful participatory ergonomics program requires initial and continuing resources and support from upper management. The resources required include: time to develop and implement solutions; financial resources to make meaningful changes; and management support for the individuals on the appointed ergonomics team.

Employees also have their input in the ***bottleneck*** inventory. The theory of constraints (Goldratt and Cox 1984) is a method to guide organizational change based on reducing bottleneck impact.

***Task rotation, work schedules changes, and shift work*** put physiological and psychological stress on the employee. Key issues include shift changes with high stress jobs like policing and inmate care (Ma et al. 2015). Ill health and sleep issues contribute to judgment and accident errors.

The hope of task or job rotation is offering less monotonous tasks, allowing more than one person to be trained on a job helps with knowledge management and transfer, and addressing turnover issues. The challenges are that not everyone manages change equally and both supervisors and employees see the short-term difficulties rather than the long-term benefits (Middlesworth (2016), "A Step-to-Step Guide to Job Rotation").

Deadlines should include time for collaborative strategies, and budget constraints complicate matters. Though structures around information and communication technology use can be planned and implemented, unplanned results including user altered work practice and culture (Orlikowoski 1992, 2002). The other necessary consideration around the participant is to understand how different people cope with rapid change that often impacts identity, culture, and hope (Lawson et al. 2000; Strickland 1998). Neglecting to do so can doom initiatives to failure.

### Teamwork

Teamwork concepts' history is relatively recent with a sharp increase in the past 40 years (Weiss and Hoegl 2015). Three teamwork categories include: transition process (between action periods), action process (when the team attempts to accomplish its goals and objectives), and interpersonal process (present in both action periods and transition periods) (LePine et al. 2008).

The typical issues that arise in teamwork are **social loafing, group think, and diversity**. Social loafing began with Ringelmann's rope pulling exercise (1913) with others determining whether the loafing was due to individual or group coordination failure (Latané et al. 1979). Karau and Williams (1993) proposed the collective effort model to generate effort and motivation predictions.

Whyte (1952) first coined Groupthink, but Janis (1971) gave the definition used today, "The more amiability and esprit de corps there is among the members of a policy-making ingroup, the greater the danger that independent critical thinking will be replaced by groupthink, which is likely to result in irrational and dehumanizing actions directed against outgroups" (p. 44). Group consensus rather than striving for the best ideas leads to production blocking, free riding, evaluation apprehension, and performance matching (Thompson 2003). Teams that are homogenous and cohesive will have a tendency toward groupthink.

Diversity attempts to prevent groupthink; however, there are problems. When one member represents a diverse element, more likely that person will stand for that diversity; e.g., an older man with a team of younger members will over-represent age differences. Communication needs to be even more emphasized on a team with diverse representation (Ruderman et al. 1996).

Wageman et al. (2009) suggest effective teams be interdependent for a common purpose with a small, stable membership. The purpose should be challenging, clear, and consequential. Norms and reward systems exist that are valued, and they have access to technical assistance and training. The more complex the task, the more challenging it is to make teams successfully accomplish it (Gratton and Erickson 2007) and the greater a chance a bad decision is made.

> Although teams that are large, virtual, diverse, and composed of highly educated specialists are increasingly crucial with challenging projects …. the qualities required for success are the same qualities that undermine success. Members of complex teams are less likely—*absent other influences*—to share knowledge freely, to learn from one another, to shift workloads flexibly to break up unexpected bottlenecks, to help one another complete jobs and meet deadlines, and to share resources—in other words, to collaborate. They are less likely to say that they "sink or swim" together, want one another to succeed, or view their goals as compatible. (Gratton and Erickson 2007, p. 2)

## Virtual Organizations and Telework

One potential answer for teams is virtual teams and their tools. Asynchronous communication may be helpful in decision-making at the initial stages, allowing everyone to participate and present ideas followed by synchronous discussions for decision-making. Tools like wikis store knowledge for team or personnel transitions.

Those working in virtual systems face challenges not previously experienced. These include working away from a central location, mobile devices with the increased multitasking challenge, a blending of times that were previously delineated: work, commute, home, holidays, and in some fields, telework allows a person to work for multiple employers (Duarte and Snyder 2001).

Using computers does not necessarily decrease cognitive load. In fact, IT usability problems may disrupt performance. The increasing numbers of interfaces at work create new cognitive demands on employees: workers need to learn several applications and use diverse systems. Here decisions are made between technology or human chores. Community informatics (Gurstein 2000, 2003) point to the vital need that all people have to have Internet and telecommunication skills and access to the conversation. Also there are generational issues of digital native versus immigrant where older workers are led by younger computer-savvy coworkers (Prensky 2001). These younger workers brains are rewired by the technology they use as appendages, and neuroplasticity can help older workers too (Small and Vogan 2008).

What if things go wrong? Automation and computerization create scenarios where the watchers are not skilled enough to solve the failures and errors. Baxter et al. (2012) suggest employees have to be taught the skills to "save the day because they are inherently flexible and adaptable" (p. 70) by being allowed to practice (and update) these skills on a regular basis and being provided with the appropriate information by the technology in a timely manner.

### Challenges

Shapiro (2001) points out, "Even though machines can enhance intelligence and knowledge … there are aspects of computerization that subtract from people's knowledge, that make people less aware of complexity and choice and less able to express their own individuality." Problems of not understanding of the accompanying issues and systemic implications include that learning and retention of interface use measures are rarely employed, and some studies treat these measures as synonymous with quality-in-use, despite an unclear relationship (Hornbaek 2006).

Participatory design methods' training takes time. Early adopters and the testers may not be the same as those that use technology later, and beginners behave differently from advanced users (Roger Rogers 1983). Design does not always take into consideration power and political issues (Beck 2002). Don Norman's *The Design of Everyday Things* (Norman 2002) suggests a focus on activity design rather than user design. He also advocates simple design that may not be the case with design by committee. So human-design focus is good for improving a product or project, and scenarios are good for marketing. Design around what a person does when encountering a problem may be more useful then asking the user how to design the item or process.

## Conclusion: Best Practices and Future Direction

From the cognitive ergonomics side, neuroergonomics "focuses on investigations of the neural bases of mental functions and physical performance in relation to technology, work, leisure, transportation, health care and other settings in the real world" (Parasuraman 2003, p. 5).

Personality differences, telecommuting effects, and what happens when things go wrong (e.g., Flight 1549 into the Hudson River and the *Andrea Gail* crew in the Perfect Storm) are current focuses. Generational shifts are occurring with more individualized portable technologies and the accompanying applications. Big data and lived informatics can be used in design. Can virtual environment utilization help astronauts in their flight to Mars? How can technology be more wearable and what does that mean for businesses and security? Can emotion recognition software create happier, more capable employees with lower accident rates? The potential and questions are endless.

Organizational ergonomics focuses on needs of employees and customers to create better systems that contributes to the wellbeing of all and healthy productivity.

# Organizational Ethnicity: A Socio-cognition Approach

Fateme Tavallaei
PNU University, Tehran, Iran

## Synonyms

Ethnicity; Organizational ethnicity; Socio-cognitive theory

## Definition

Organizational ethnicity refers to the ethnic individuals or groups in organizations and their opportunities or challenges. Under the umbrella of this concept, various strategies can be implemented according to the sensitivity of the issue such as financial, human resource management, and organizational behavior. In this area, socio-cognition theory with its inherently reciprocal nature can explain the capabilities of one individual for adaption.

## Introduction

Nations all over the world are like puzzles with different and distinct separated parts stupendously live under the umbrella of one country with a unique identity. Diversity includes race, gender, socioeconomic class, perspectives, and ethnicity. Among lots of researches about diversity, ethnicity is less studied.

Today, a large portion of the existing nation-states consist of more than one ethnic group and only few world's states were homogenous nations. Some examples of multi-ethnical countries are: Afghanistan, Andorra, Angola,

Antigua, Bahamas, Bahrain, Belarus, Belgium, Belize, Bhutan, Bolivia, Bosnia and Herzegovina, Brazil, Brunei, Bulgaria, Burkina, Cameroon, Canada, Central African Republic, Chad, Colombia, Congo, Democratic Republic of the Congo, Côte d'Ivoire, Cuba, Cyprus, Djibouti, Dominica, Ecuador, Eritrea, Estonia, Ethiopia, Fiji, Gabon,Guatemala, Guinea, Guyana, India, Indonesia, Iran, Iraq, Kazakhstan, Kenya, Kuwait, Kyrgyzstan, Laos Latvia, Luxembourg, Madagascar, Malaysia, Mali, Mexico, Montenegro, Myanmar, Nauru, Nepal, New Zealand, Nicaragua, Niger, Nigeria, Palau, Panama, Peru, Philippines, Qatar, Russia, Senegal, Serbia, Seychelles, Sierra Leone, Singapore, South Africa, Sri Lanka, Sudan, Suriname, Sweden, Switzerland, Taiwan, Tajikistan, Thailand, Trinidad and Tobago, Turkey, Uganda, Ukraine, United Arab Emirates, The United Kingdom, The United States, Uzbekistan, Venezuela, and Vietnam.

Many nations have ethnically heterogeneous societies that show the important role of ethnicity.

For example, in Iran, there are lots of ethnic groups, such as: Persian, Azerbaijani, Gilaki, Kurd, Arab, Lur, Baloch, and Turkmen. These are the most populated ethnic groups in Iran that each one separated to subbranches, too. For example, Lur ethnic group is divided to Bakhtiari, Fili, Lak, Balagrive, and Mamasani.

Ethnicity shows some similarity in dynasty, history, destiny, collective unite, solidarity, language, religion, style of clothes, and ornament.

This harmony of distinction can strengthen the nationalities to overcome obstacles and make synergy by the use of different perspectives and capabilities, such as utilizing of talents, more creativity, more innovation, or better problem-solving. But on the other hand, being unable to tolerate the differentiation can cause huge problems such as quarrel and threat. Ethnic conflict and lots of deaths from political violence are some problems for nation states. Government strategies and policies can help to solve the problems. Besides that, sociopsychological elements are important to adapt the situations.

Confronting each type of diversity including ethnicity, race, gender, socio-economic class, or perspectives and where and when the issue occurs may have different solutions. Ethnicity is studied in Anthropology, History, Political Science, International relations, Archeology, and Sociology but organizational ethnicity has not much been researched yet.

Organizations are part of the society to meet the needs. The complex and multi-faced and multi-dimensional nature of organizations can be impacted by ethnicity. Differences in cultural norms and values among ethnic groups can cause different work-related behaviors. Besides governmental and organizational strategies toward the ethnicity, individual's sociopsychological factors can demonstrate how much they are ready to accept the situations and it is impacted by the environment due to multidimensional aspect of organizations.

One of the theories to cover this complexity is socio-cognition which is not much studied in ethnicity area. Socio-cognitive theory helps to explain how much an individual can accept the ethnicity in an organization through the impact of the cognition, environment, and behavior factors and can achieve the goals, accomplish tasks in facing of difficult situations, obtain important outcomes, overcome the challenges, etc. So according to the complexity, importance and deficiencies of the issue, this entry tries to define ethnicity from various perspectives and then explains its important role in organizations through socio-cognition theory.

## Ethnicity

Diversity has many aspects including racial, gender, class representation, or even varied perspectives and approaches toward a society. One of the important aspects of diversity is ethnicity.

Ethnicity came from ethnos, an Egyptian word focusing on people distinction and differentiation in a society (Johnston et al. 1994). Ethnicity was first studied in Anthropology but then it came into social studies, and in the recent century, it

becomes an important issue (Breton 1931). It is almost new in social studies without a fixed meaning in researches. Some researches consider it as a completely social concept with a concentration on cultural and behavioral perspectives which leads to make a distinction among societies. People belong to an ethnic group, consider themselves different from other groups in society and also be considered different by others. Ethnicity is a social structure or a confirmed personal identity. It is also called a social identity appearing in social interactions and internalizing in personal awareness (Bulmer and Solomos 1999).

Ethnicity is feeling some kind of similarity in dynasty, history, destiny, collective unite, and solidarity or a cultural phenomenon. Some important characteristics of ethnic groups are language, history, dynasty, religion, style of clothes, and ornament. Most of them are cultural and learned behavioral distinctions. Ethnic convergence means the tendency of orientation, friendship and voluntary cooperation between two or more people (Bahramian and Bahramian 2012). History, ancestral land, native language, tribal beliefs and traditions, national heroes, religious tribes, ethnocentrism, artistic and hereditary literature can make a cultural identity. In a smaller scale, ethnic identity including blood imitation, ancestors, and mythology make the connection of social and political hierarchy. National identity makes the commitment, affiliation, unity, cohesion, authority, and security to society (Moradi 2015). Ethnic diversity includes different ethnics with its own special identities in a town, city, country, group, etc.

Cultural diversity can strengthen the cultural, ethnic, and national identity but without a proper public policy, it acts as a factor of decomposition and weakening. Knowing the importance and influencing factors can lead to better strategies toward the issue. These distinctions cannot be omitted and to create unity is something approximately. But some factors can strengthen the cohesion among ethnic groups; race which was considered the primary element in the past but with less importance today, language, economic and political power, governmental support, rich written heritage with its impact on stronger affiliation to local language and culture, convergence of language with religion, non-monopoly to a particular country, world capabilities of culture and language, understanding different dialects, customs and social traditions, religion, country, land, and economic (Nasaj 2009). Some factors that may threat: deprivation that causes economic, social, and political distinction of one area from others, ethnic and nonethnic elites with the aim of getting power, and national and international threat.

Due to the importance of ethnicity, it is studied in various field of studies, such as Anthropology, History, Political Science, International relations, Archeology, and Sociology. Historical ethnicity is a branch of social history. It studies ethnic groups. These kind of studies provide a basement to analyze the quality and quantity data extracted from social and historical models and have a deeper look into policy- and decision-makings. McDonald (2007) identifies five main areas of interest for scholarship on US ethnic history: the origins and meaning of ethnicity, particularly the issue of whether it is inherited or invented; the origins of ethnic diversity (such as conquest, immigration, involuntary migration); models of ethnic adaptation (especially the melting pot, mosaic, salad bowl, and kaleidoscope metaphors); ethnic incorporation into the social, economic, and political fabric of the receiving country; and minority group survival strategies, including responses to competing forms of allegiance like class and gender.

From Archeology perspective, it is used to achieve the old cultures from what is retained as Antiquities. The left place and texts can show some ethnicity in those days. From Anthropology perspective, ethnicity is a cultural feature that unites the members of one group together. Anthropologists tend to historical and political conceptions more than behavioral ones. In political science, ethnicity is an important issue in pluralistic societies and especially in developing countries, it can cause problems such as inconstancy. Governments have critical roles in controlling ethnicity quarrels. They should make proper policies to organize ethnics and lead them through goals, succession, and constancy. In an

international view, ethnicity can cause violent, quarrels, and wars in a country or among countries.

But ethnicity in organizations and firms are rarely studied. Organizations are built for meeting social needs. Human resources are the important part of it and without a proper strategy toward any kind of diversity including ethnicity, it may fail in function and performance. Many aspects should be considered toward organizational ethnicity including leadership, support, etc. But one which was rare considered is socio-cognition as an adapting element. Organizations are identities which include multifaced and multilevel factors and the distinction among person and group and organization is very blurred indeed. The theory can inherently bring the triple view of the environment, cognition, and behavioral aspects around ethnicity and make the role of an ethnic individual, group, and organization more clear. According to the importance of the issue, this entry tries to give an organizational diversity and ethnicity perspective through socio-cognition theory.

## Organizational Ethnicity

Organizations are part of the society that make the relationship between its members and environments to meet their needs. They include goals, visions, infrastructures, structures, teams, staffs, processes, and systems. HRM have crucial roles in organizations. They confront lots of issues. One area which is rarely studied is diversity and especially ethnicity. Globalization and high labor mobility results in the growth of ethnic minority populations. They have their own experience, attitudes, and behaviors. They are often influenced by race-ethnicity in the workplace (Allen 1995). Social exchange, feeling of acceptance, inclusion, respect, belonging, career success, turn over, job satisfaction, responsibility and promotion, cognitive judgment component, job characteristics, socioeconomic status, and the access to resources are other challenges that ethnic groups face in organizations (Weiss and Cropanzano 1996). In the strategy level, the firm board can be impacted by diversity and then positively associated with a performance by increasing decision-making capacity. On the other side, increasing conflict can detract group performance (Erhardt et al. 2003). In the tactical level, shortage and supply of professional and skilled workers or their replacement takes a lot of costs for organizations and they need to find the ways of retaining and supporting qualified skilled workers (Chevalier 2008).

Cox and Blake (1991) stated that cost, the attraction of human resources, marketing success, creativity and innovation, problem-solving quality, and organizational flexibility directly impacted by the management of cultural diversity. Diversity increases the cost of poor jobs in integrating workers.

The organizations with a better reputation for managing diversity have more chances to get better personnel. Bringing different insight and cultural sensitivity into marketing can improve the operations. Less emphasis on past norms through different perspectives can enhance the level of creativity. A wider range of perspectives and critical analysis can lead to better problem-solving and decision-making. Being less determinant, less standardized and more fluid to react to environment changes is another issue of managing diversity (Cox and Blake 1991).

The leadership should understand that different ethnics have their own perspectives and approaches to work and need to be respected in spite of their different opinions and insights. It can cause new learning opportunities and also challenges and can be moderated with a unique standard performance expectation from everyone. People feel worthwhile when organizational culture encourages openness, stimulate personal development, have a well-articulated and widely understood mission, and a relatively egalitarian, and non-bureaucratic structure (Ely and Thomas 1996).

Directing the ethnic organizational potentials in a proper way leads to better utilization of talent, increased marketplace understanding and business growth, creativity and innovation, enhanced breadth of understanding in leadership positions, enhanced creativity, increased quality of team problem-solving, and a greater knowledge base

and competitive advantage (Robinson and Dechant 1997).

Robinson, & Dechant (1997) stated that organizations can handle their diversity by determining business objectives or needs, consideration of the business strategy and opportunities, identifying required actions for each one by deciding on the scope of target, specific objectives, and a particular short-term payback of investment, conducting a cost/benefit analysis in the initiative, implementation expected return, and developing tracking mechanisms to assess progress, business performance, financial impact, monitoring processes, and rewarding systems.

Recognizing attraction, retention, and the way of support for ethnic groups is another issue for organizational performance.

Cox and Blake (1991) stated that diversity management can be improved by proper leadership, training, research, analysis, change of culture, human resource management, and follow-up system. They include top management support, commitment, the need for change, awareness training with focusing on valuing diversity, self-awareness, stereotyping and cross-cultural insensitivity, and skill-building training about how to respond to differences in the workplace, collecting information about employees traditional, attitudes, perceptions, and career experiences of different cultural groups to use in training programs and identifying areas where changes are needed, evaluating the change effort, undertaking recruitment, performance appraisal, potential assessment and promotion, compensation, monitoring change, evaluating the results and institutionalizing the changes, accountability, and control. To implement and measure these systems, focus groups, surveys, interviews, and various culture audits or assessments can be beneficial.

## Socio-Cognition Theory Toward Organizational Ethnicity

In the previous section, some challenges, opportunities, and organizational strategies toward ethnicity were discussed such as a proper leadership, training, research, analysis and change of culture and human resource management, and follow-up system. But these are only organizational part. It is important to know how much an ethnic individual has capability to adapt which is again can be impacted by organizational situation. Considering sociopsychological elements can help to demonstrate an individual role in the organizational multifaced area.

Ethnicity with its different perspectives and opinions can impact the cognitive and decision-making processes of individuals in organizations. It can impact the top management decision of how to handle the whole corporate and also a simple worker performance. So, it is important to consider some psychological issues besides diversity management strategies.

The sociopsychological impacts in this area are: feeling of isolation, lowered identification with coworkers and workgroups, and exclusion from formal and informal networks, the difference of decision-making in homogeneous groups and diverse ones, organizational performance, learning-effectiveness of organizational learning, growth, and renewal besides discrimination-fairness, and access-legitimacy paradigm, integrating affective, cognitive, and social perspectives to enhance career success, psychosocial mentoring and interventions to enhance ethnic workers, sociological theories in cultural pluralism paradigm to encourage acceptance of interpersonal differences, feeling less social acceptance at work and leading to lower career satisfaction, social outcomes, job satisfaction, and commitment. Kochan et al. (2003) stated that the organization's strategy, culture, and human resource (HR) practices have crucial roles on performance. Culture, demographic, technical and cognitive factors are as inputs and communications, conflict, cohesion, information, creativity are as mediators and performance, satisfaction, turnover are as outcomes. These kinds of differences can contribute to fragmentation of workgroups. In sum, ethnicity has both negative and positive sociopsychological impact. So how can ethnicity interpreted in organizations? It is obvious that it depends on the situation and also individuals themselves.

Organizations are multidimensional and multi-faced entities. As Gioia and Sims (1986) stated: "Given the nature of organizations as socially constructed entities, and the nature of individuals as socially immersed and influenced, the lines defining what is an individual phenomenon and what is an organizational phenomenon are very blurred indeed. In this sense, social cognition transcends both the cognitive approach (which emphasizes on individual cognitive and learning processes) and the structural approach (which emphasizes on organizational routines and cultures.)." In one side, individual factors shape the decision to resistant or adapt the situation. In the other side, adaption is a social process which is impacted by collogues, organizational change, and norms. Through these social interactive, the adaption would be possible (Hord et al. 1987). Going through this concept, the environmental, behavioral, and cognitive elements impact each other in a triple way. Socio-cognitive theory comes to explain these complex phenomenon. Bandura (1986) who defined the socio-cognitive theory stated that "many of the theories that have been proposed over the years to explain human socio-cognitive functioning have relied heavily on causal models favoring one-sided determinism. In such models of unidirectional causation, the behavior is depicted as being shaped and regulated either by environmental influences or by internal dispositions. In the more recent, partially bidirectional models of causation, persons and situations affect each other but their influence on behavior flows uni-directionally."

The social cognitive theory explains triadic reciprocal causation functioning (Bandura 1986). The model provides a dynamic structure that reflects ability and judgments of one person about him/herself and can lead to motivate to adapt. Environmental factors like social pressure besides cognitional factors like demographic variables and also behavioral factors impact each other in a triple way. Bandura (1982) stated that the interpretation of one person about his/her ability depends on the various factors like enactive mastery, experience, vicarious experience, verbal persuasion, and emotional arousal. One of the factors in socio-cognition theory is self-efficacy referring to the "beliefs in one's capabilities to organize and execute the courses of action required to produce given attainments" (Bandura 1997). "Beliefs in one's capabilities to mobilize the motivation, cognitive resources, and courses of action needed to meet given situational demands" (Wood and Bandura 1989). Research has found that self-efficacy predicts several important work-related outcomes, including job attitudes, training proficiency, and job performance. According to social cognitive theory (Bandura 1986, 1997), self-efficacy beliefs vary on three dimensions: (a) level or magnitude (particular level of task difficulty), (b) strength (certainty of successfully performing a particular level of task difficulty), and (c) generality (the extent to which magnitude and strength beliefs generalize across tasks and situations).

In spite of the fact that ethnicity exist, an individual should be aware of how much ability and capability needs to achieve the goals, accomplish tasks even in facing of difficult situations, obtain important outcomes, believe in succeed in any endeavor set in the mind, overcome the challenges, perform effectively on many different tasks, etc.

Kochan et al. (2003) stated that trained members and leaders communicate and solve problems more in diverse teams. So "team working skills" should be considered in this area. Socio-cognition theory helps to understand how much an individual is ready to accept the situation and learn.

Besides socio-cognition theory, future researches can add goal setting and expectation theories to demonstrate the commitment or how much convenient an individual feels in the adaption process.

## Conclusion

This entry was about ethnicity in organizations. Ethnicity is one aspect of diversity with a huge

impact on all parts of society. It is considered in various researches such as Anthropology, History, Sociology, etc. Although it has a crucial role in organizations, studies in this area are very rare indeed. Previous researches tried to investigate the opportunities, challenges, and the impacts that ethnicity brings such as increasing or decreasing performance, job satisfaction, cost, etc. Some solutions were suggested in the entry, such as a proper leadership, training, research, analysis and change of culture and human resource management, and follow-up system. But these are only the organizational roles. Besides organizational strategies, considering sociopsychological elements is necessary. It is important to know how much an ethnic individual has capability to adapt the situation which is again can be impacted by organizational environment and other behaviors. According to organizational nature as multifaced entities, socio-cognition theory can be suitable to analyze one's capacities of adaption and learning. It gives three reciprocal ways that cover both cognitive and social elements. Future researches can use this theory for organizational ethnicity alone or by combining with other elements such as goal setting or expectation theories to show the commitment and convenient of ethnic individuals to achieve their job outcome and expectation.

# Organizational Evil

Carole L. Jurkiewicz
McCormack College of Management, University of Massachusetts Boston, Boston, MA, USA

## Synonyms

Corruption; Institutional ethicality; Intentional organizational harms; Unethical behavior

## Definition

> Organizational evil is the institutionalization of a set of principles and practices whose purpose is to knowingly harm individuals, with disregard for the consequences beyond those that would cause immediate repercussions to the evil-doer. (Jurkiewicz and Grossman 2012, p. 3)

## Introduction

While some may disagree on precisely what constitutes unethical behavior, there is a general consensus that such behavior is individually enacted and episodic in nature and that it occurs in some instances but does not necessarily define the individual as unethical. But how to describe unethical behavior that goes well beyond an occasional occurrence and is embedded in the culture of the organization? Evil describes this next level of moral violation and is systemic, encompassing hiring and training, reward systems, policies, programs, practices, and internal/external relations, all executed with intentionality and intended to maximize advantage through the willful harm caused to others. Successes in this regard are celebrated; the evidence of evildoing is obfuscated, with the perpetrators' goal of deflecting any culpability directed them. This is the focus of current research on organizational evil.

## Overview

The earliest inquiries into the nature of evil were encompassed within the study of metaphysics, wherein evil was defined simply as the absence of good, essentially that acts were either one or the other (Anderson 2006). Over time the conception of evil melded into those acts that deprived individuals of basic human rights (Dillard and Ruchala 2005) and for some that included a joy derived from hurting others. Modern research focuses upon operational evil, how it evinces itself within organizational systems, rather than the study of evil as an abstract concept. As defined, "organizational evil is the institutionalization of a set of principles and practices whose purpose is to knowingly harm individuals, with disregard for the consequences beyond those that would cause immediate repercussions to the evildoer" (Jurkiewicz and Grossman 2012, p. 3).

Leaders shape an organization's culture, whether for good or evil, through modeling behavior, rewards and punishments, and the policies and practices they establish and enforce. In large part, hiring decisions are made based on how well it is perceived that the prospective employee shares the organization's values. Concomitant with the growth and success of an organization, employees feel more closely associated with its culture (Schein 1996); this affiliation is strengthened through specialized argot, unique traditions, and understood but unwritten codes of behavior. Emerging from these behavioral codes, a set of moral guides develops that establishes what is acceptable and what is discouraged. Codes can articulate ethical or evil behavior; gangs have codes as well as the Nazi regime, just as socially responsible organizations and international relief agencies may have codes. Thus, while the specifics may differ, the process by which this formalized or informal moral code develops is the same regardless of the ethicality of the organization. It is this banality with which evil develops that, to many, can be the most terrifying aspect of evil. If an ethical code were replaced with an evil one overnight, it would naturally be shunned. But an incremental change in the moral code and

culture over time can occur unnoticed, until the point that the organization's culture may appear to be significantly different from a preview at point A to a post-measure at point B (Fig. 1).

A common question is when can an organization accurately be termed as evil? Is it when 50% of its practices and policies fit the definition of evil? 75%? 100%? Jurkiewicz and Grossman (2012) introduced a continuum to illustrate the range of ethicality within and among organizations. Even the most evil organizations one can imagine exhibit some level of civility, if only in an occasional pleasant verbal exchange, just as an organization closest to saintliness has negative conflict from time to time, so no one organization can be defined as 100% or 100% evil. The tipping point for when an organization can be effectually termed evil is when the preponderance of its practices, programs, policies, and reward/punishment mechanisms serve the "purpose is to knowingly harm individuals, with disregard for the consequences beyond those that would cause immediate repercussions to the evil-doer" (Jurkiewicz and Grossman 2012, p. 3). Chomsky and McChesney (2011) contends that evil organizations are the norm, that organizations by definition are deliberately structured to manipulate individuals for revenue or self-advantage, and that people are merely instruments for goal attainment and are useful only insofar as they can fulfill an organization's aims. Certainly, as required by law, the purpose of organizations is to further their pursuit of self-interest, meaning power, profit, and profligation, irrespective of the means to attain it.

As organizations are defined by law as persons (Bakan 2004), they can be said to exhibit personality and personality disorders. As Bakan (2004, p. 56) states, the personality disorder seen in psychopathic organizations is identified by the motivation "to destroy [their] competition. . .[they] want to beat them one way or another. . .and [they're] not particularly concerned with what happens to the general public as long as they're buying [their] product." The product can be merchandise, programs, initiatives, or candidates, and it is fully self-focused, which puts individuals at risk. Organizations are essentially asocial and incapable of empathetic action. Although individuals can be ethically multiplicative (Jurkiewicz 2002), organizations are not able to compartmentalize evil and separate it from their other operations. As Bakan (1994, p. 57) continues, organizations manipulate seek control over "everything, including public opinion," and assert they are, "number one. . .the best. . ..their behavior indicates they don't really concern themselves with their victims." They "refuse to accept responsibility for their own actions and are unable to feel remorse; if [they] get caught breaking the law they

**Ethical** – Acting to achieve the greatest good for the greatest number; acting on principles that seek rights, justice, equality; foregoing personal gain for long-term societal benefit
**Unethical** – Occasionally making decisions and acting in a manner that confers immediate individual advantage while disadvantaging the many; engaging in sporadic deception and demonstrating lack of concern for others
**Bounded Evil** – Individuals acting unethically a high percentage of the time, yet most organizational policies and practices support equality, rights, and justice
**Pervasive Evil** – An organizational culture that intentionally harms others in order to confer short-term advantages as exhibited through policies, practices, programs, and reward systems

**Organizational Evil, Fig. 1** Dimensions of organizational evil. (Adapted from Jurkiewicz and Grossman (2012))

pay big fines and. . .continue doing what they did before; in many cases the profit or advantage obtained is worth substantially more than the fines imposed. . .their whole goal is to present themselves to the public in a way that is appealing. . .but in fact may not be representative of what the organization is really like" (Fig. 2).

Paradoxically, while organizations hold the legal status of a person, they have no moral obligations. With the organization as the entity of record, employees are effectively legally free to carry out their jobs in any manner that brings them the greatest gains. Thus, those who act evilly are rewarded as the potential monetary gain is high while the possibility of negative consequences comparatively low. Lowering or removing standards of accountability along with any potential punishments is advocated for through political contributions, lobbying, and image campaigns intended to influence the public's perceptions of an organization's unethical and evil activities. Bakan's (1994) contention that while society wouldn't consider it sane to remove laws forbidding criminal activity by individuals, nor the punishments meted out for such violations, it does allow the removal of such restrictions for organizations, although organizations can cause more far-reaching and permanent harms to greater numbers of individuals. The concept that organizations can regulate themselves is widely advocated and generally viewed as reasonable under the guise of creating savings for consumers. The absurdity of such a notion is underscored by the widespread psychopathological, and evil, behavior of most organizations: no concern for individuals' feelings or safety, inability to maintain long-term relationships, deceitfulness and lying to gain advantage or profit, inability to experience guilt, and a rejection of laws and social norms (Jurkiewicz and Grossman 2012). As organizations have grown in social and monetary importance over time, most have come to accept that such embodiments of evil are the norm, particularly in the proprietary sector, that it is simply how business (whether the business of governments, corporations, or nonprofits) is done and one is naïve to think otherwise.

Adorno (2000) notes that over time individuals have perfected their ability to separate the consequences of their acts from who they believe themselves to be as people, effectively dehumanizing themselves as a means of survival in an increasingly evil world. By doing so, he asserts that any and all behaviors are justifiable and that an individual's ethical framework is subjugated to that of the economic forces of one's environment. Adorno (2002) further argues that societies in general are evolving toward complete organizational control, as individuals accept the removal of laws and sanctions and succumb to the manipulations of image management that organizations are paternal forces, looking out for our interests and caring for us and society in ways we can't do for ourselves. This is the embodiment of evil.

Organizational evil is also configured as organizational narcissism (Jurkiewicz and Grossman 2012), where organizations focus on perpetuating an image of faultlessness and superiority through self-advocacy and treating others as inferior. Twenge and Campbell (2009) developed a Narcissistic Personality Inventory which is adapted here as an analytic organizational measure, again rooted in the legal definition of the organization as a person (Fig. 3).

The increased level of narcissism in evil organizations mirrors that which Twenge et al. (2008) found in individuals. Both are focused on attaining short-term self-advantage and exhibit value

- Callous unconcern for others' feelings
- Incapable of maintaining enduring relationships
- Reckless disregard for others' safety
- Repeated lying and engaging in deceitful behavior toward others for profit or advantage
- Inability to experience guilt
- Refusal to conform to social norms with regard to lawful behaviors

**Organizational Evil, Fig. 2** Psychopathological factors in organizations. (Adapted from Bakan (1994))

- ✓ If our organization were in charge of setting the rules, the world would be a much better place.
- ✓ We prefer it when our organization is the center of attention.
- ✓ We can act in whatever way we desire; we know what is best for us.
- ✓ We like to show off our power and assets and seek an attention-grabbing media presence.
- ✓ We will never be satisfied until we are the dominant organization (or political party).
- ✓ We think we are special and we are better than our competitors.
- ✓ It is easy to manipulate people into doing what you want.
- ✓ We will avail ourselves of opportunities to communicate our strengths and importance.
- ✓ We are extraordinary.
- ✓ We enjoy the ability to exercise control over our colleagues, clients, and competitors.

**Organizational Evil, Fig. 3** The narcissistic organizational personality inventory. (Adapted by Twenge and Campbell (2009, pp. 20–21))

systems that prioritize immediate gains and self-aggrandizement regardless of the consequences. As Twenge and Campbell (2009, p. 37) identify it, it's a "pernicious virus" infecting society in general.

## The Culture of Evil

Baumeister (1997) asserts that evil is motivated by one or multiple root causes: the desire for material gain, threatened egotism, idealism, and/or sadism, and is facilitated by a distortion of the truth in order to reassure the individual or organization of its essential goodness. He defines the difference of perception of an evil act between the perpetrator and the victim as the Magnitude Gap: the perpetrator can dismiss the act and separate it from the organization to maintain its image of perfection, and the victim likely feels harmed and less positive about the perpetrator; generally, the victim's loss is greater than the perpetrator's gain. Darley's and Latane's (1968) classic experiments on the diffusion of responsibility when more than one person are actors explain to a large degree how individuals in an organization can engage in evil behavior but lessen or deny their own responsibility and attribute it instead to the organization as a whole. This behavioral phenomenon facilitates scapegoat activities when the organization is looking for someone to blame while claiming general ethicality and removes the motivation to act ethically (Jackall 1988). The ambiguity inherent in collective evil activity makes it especially easy to shift the blame to another if someone is accused of unethical or evil behavior. Escaping blame encourages future evil and/or unethical behavior, thereby proliferating it within the organization. As Jackall (1988) observed, blame is concentrated at the lower levels of the hierarchy with higher organizational members acting in often evil, expedient ways to show enough short-term progress to warrant a promotion, thereby leaving the consequences of their behaviors to the subordinates who remain. Thus, evil behavior as described here can benefit individuals and is often encouraged within organizations as a savvy method of conducting business. When a group of people act evilly in concordance, no single individual is likely to separate from the group and denounce the behaviors, separating the act from one's view of themselves or the organization in order to maintain the belief of goodness. This assuages the human need to fit in with a group, and adopting an evil culture in order to be accepted by the group is viewed as a necessary function of organizational life.

Vickers (2012) framed the concept of necessary evil as occurring when organizations cause intentional harms to individuals or groups under the guise of sacrificing for the greater good for all. Necessary evil justifies behaviors such as bullying, intimidation, fraud, violence, etc. such that over time they become an accepted aspect of achieving organizational ends. Such normative behavior again enlists the needs of most humans to identify with a group, from which emerges a perpetuation of evils by individuals acting on their own behalf, but it is not without consequence. Engaging in such behaviors although sanctioned and expected within the workplace lead to employees' negative physical and psychological health outcomes (Giacalone et al. 2016).

## Conclusion

Individuals' behavior at work is largely influenced by the organization's culture, which rewards and punishes behavior in order to shape it in accord with the individual's need for acceptance and belonging. The system of influence affects evil behaviors just as it does ethical behaviors. From every group culture emerges an ethical framework uniquely influenced by its leader, and this framework defines for employees the expected and unacceptable behavioral expectations and can be evil, ethical, or at points in between. The effect of organizational evil on employees, their families, and society in general is overwhelming and in many cases obfuscated by justifications, influence, and rationalization; evil within organizations has grown over time to represent a majority of institutions. The US populace, among many other countries, has become habituated to the degree that we expect to be harmed by organizations and are surprised when we are not.

Yet there is something we can do rather than accepting this as a fait accompli. We would need to be proactive in preventing evil from getting a foothold by calling out unethical behaviors and following through on the consequences for such acts, not being silenced by political correctness. Each act moves the individual and organization toward the left or to the right on the continuum presented in Fig. 1. Enforcing transparency, accountability, and personal responsibility at all hierarchical levels and in all sectors is essential. Organizations cannot be depended upon to monitor themselves, and thus the development of oversight systems, procedures, and practices is key to stemming and reversing evil. What does an unevil organization look like? It's one where the structure supports honesty and seeks the good of all, where transparency is expected and reinforced, and where whistleblowers are protected and seeking self-advantage at the sake of others is not tolerated. Legal reinforcements can support these efforts, although alone they will not have an impact.

Research has shown (Jurkiewicz and Giacalone 2016) that ethical organizations are more financially successful, have healthier and more loyal employees, contribute to the social welfare of their communities, and provide economic and health benefits to the society at large. The effects of organizational evil are wide-ranging and treacherous, and it is much easier to prevent than repair. Ignoring unethical acts, making excuses for or hiding such behaviors, or rewarding individuals who engage in them is, whether through commission or omission, supporting the development of organizational evil.

# Organizational Excellence

Dawn Ringrose
Organizational Excellence Specialists Inc,
Courtenay, BC, Canada

## Synonyms

Operational excellence; Quality management system; Total quality management

## Definition

Appreciative inquiry: is a model that seeks to engage stakeholders in self-determined change. The approach builds on strengths and enables opportunities for improvement through analysis, understanding, and discussion.
Benchmarking: is the process of comparing an organization's business processes and performance metrics to industry's best-in-class and best practices from other companies. This comparison allows the organization to learn from others and improve performance.
Best management practice: is a method or technique that has been generally accepted as superior as it produces results that are superior to those achieved by other means.
Continuous improvement: is an ongoing effort to improve products, services, or processes. These efforts can realize incremental improvement over time or breakthrough improvement all at once.
ISO 9001: is a quality assurance system or standard designed to help organizations ensure they meet the needs of customers and other stakeholders. Third-party certification bodies provide independent confirmation that organizations meet the requirements of the standard.
Principles: form the foundation for organizational excellence and characterize the culture and values of the organization and depict the way people work together and with their stakeholders.
Lean: is a work process improvement methodology that focuses on the elimination of waste (e.g., transportation, inventory, motion, waiting, overproduction, overprocessing, defects) within an organization to improve overall customer value.
Organizational excellence: refers to the use of best management practices common to high-performing organizations that, when successfully implemented, contribute to a culture committed to excellence and sustainable results across a balanced system of measurement.
Performance improvement: is measuring the output of a particular business process or procedure and then modifying the process or procedure to increase the output, efficiency, or effectiveness of the process or procedure.

Six Sigma: is a set of techniques and tools for process improvement that seeks to improve the quality of the output of a business process by identifying and removing the causes of defects and minimizing variability in the process.

## Introduction

What is organizational excellence? *Organizational excellence* refers to the use of best management practices common to high-performing organizations that, when successfully implemented, contribute to a culture committed to excellence and sustainable results across a balanced system of measurement.

The principles describing the culture and the best management practices were first identified and defined in organizational excellence (OE) models including EFQM (2010), Baldrige (NIST 2010), Canadian Framework for Excellence (Excellence Canada 2010), and the Australian Business Excellence Framework (SAI Global 2010) in the late 1980s and early 1990s. Since that time, these OE models have evolved and other models have been developed that include a combination of these principles and best management practices. Today, many countries have developed national award programs to recognize organizations that have successfully implemented an excellence model and sustained performance improvement (Mann and Abbas 2015).

OE models can be used by any size and type of organization. Organizations that have successfully implemented OE models have been recognized by national award programs and reported results such as good governance, trust in leadership, customer delight, employee engagement, continually improving work processes, strong supplier and partner relationships, better utilization of resources, balanced system of measurement, and financial results.

## Key Research Findings

A European study (Boulter et al. 2005) found that when the principles of the EFQM Excellence Model have been implemented effectively, performance improves in both short- and long-term periods. Researchers examined award winners against comparison companies of similar size and industry sector over an 11-year period and found that award winners experienced higher increases in share value, average growth in sales, reduction in costs, and increases in operating income. Other accounting measures were also computed and showed similar results (e.g., change in capital expenditure over sales/assets, change in total assets, change in the number of employees).

An American study (Link and Scott 2011) compared the benefits received by Baldrige award winners from 2007 to 2010 with the cost of operating the program and reported a benefit-to-cost ratio of 820–1.

Another study in the United States (Booz Allen Hamilton 2003) assessed the attitudes and perceptions of senior leaders toward the Baldrige Award and Criteria and revealed very broad, positive recognition among leaders in each of the award eligible sectors: manufacturing, service, education, health care, and small business. In addition, more than 70% of leaders surveyed at Fortune 1,000 companies said they are likely to use the criteria.

In Australia, case studies (Pattison 2011) were undertaken with eight local government councils facing similar challenges: state government reform agendas, growing community expectations on service standards, increasing levels of public scrutiny, technology improvements, skills shortages, rate capping and fiscal constraints, complex legislative environment, and an overall mandate to achieve more with less. Each of the councils used the Australian Business Excellence Framework to assess and improve their organization and now understand the Framework can be used to assess and improve any aspect of their organization including leadership, strategy and planning, people, information and knowledge, safety, service delivery, product quality, and bottom-line results.

Canadian research (Stoehr 2010) has tracked the performance results of award recipients from public, private, and nonprofit sectors and noted

improvements in employee turnover, cost savings, customer and employee satisfaction, cycle time, price savings to client, injuries, employee pride, and trust in leadership.

The Centre for Organizational Excellence Research in New Zealand (Mann et al. 2011) reported research findings on the impact and value of business excellence in Asia (i.e., India, Japan, Singapore, Taiwan, Thailand). Companies participating in the research reported that business excellence had a major impact on their competitiveness and performance and were relevant for long-term competitiveness and sustainability.

A recently published report by the American Society for Quality (ASQ 2011) on the future of excellence examined a number of factors influencing organizations today and the future and concluded that OE models will continue to be relevant for improving and sustaining organizational performance.

The factors influencing organizations included:

- Globalization – dealing with rapid communication, interrelated economies, finite resources, desire for improved quality of life, and environmental concerns
- Productivity – developed countries losing their competitive advantage
- Technology – capitalizing on technology that contributes to working more efficiently and effectively and reduces cost of doing business
- Consumers – becoming more aware of their options, seeking customized offerings, and demanding that organizations are socially and environmentally responsible, ethical, and accountable
- Workforce – employees seeking out employers of choice that use systems thinking and offer lifelong learning, healthy workplace, and flexible work arrangements
- Organization mindset – the growing need to scrutinize decisions for impact on all stakeholders, metrics moving from traditional product measures to social and environmental measures, perception of value moving from emphasis on triple bottom line to system thinking, and the effects of interdependent and interrelated work processes
- Political and individual will – continuing to choose the easiest path by focusing on short-term issues that contribute to life enhancement at the expense of long-term issues that satisfy sustenance, knowing that emphasizing wealth will lead to system collapse while emphasizing austerity will be transformative, and understanding the relationship between different types of data and certainty

When evaluating how best to deal with these factors, the study concluded that successful organizations of the future would have an OE model in place and share the following characteristics:

- Have excellence principles well entrenched in their culture
- Have an ability to respond to change with speed, agility, and flexibility
- Be more transparent
- Recruit globally for diverse skill sets and locally for retired individuals to coach and mentor others
- Engage people to focus on organizational strengths and use collective intelligence to build organizational capacity
- Anticipate the customer's requirements
- Focus on collaboration as opposed to competition
- Use technology that contributes to the efficiency or effectiveness of work processes
- Establish simpler work systems with the collaboration of employees, suppliers, and partners
- Use simpler metrics so everyone can understand performance
- Focus on sustainability, servicing the community, and world betterment
- Advocate for government to focus on long-term issues

## Key Benefits

Both research and practical experience implementing OE models would suggest there are a number of key benefits for the organization. These benefits include:

1. Provide the foundation on which to develop an organization. The OE model provides a collection of best management practices for each key management area (e.g., governance, leadership, planning, customers, employees, work processes, suppliers and partners, resource management, performance measurement). These practices can be implemented at any stage of an organization's life cycle. A start-up organization can implement the best management practices right the first time, while an organization that has been operating for some time can build on their strengths and capitalize on opportunities for improvement.
2. Provide an integrated and coordinated way to drive tangible results. The OE model provides a well-defined path for the excellence journey. For each key management area, there are practices to implement and measures that can be used to gauge progress. Measurement results highlight where the organization is doing well and where it needs to improve and allow for data-based decision making.
3. Identify the interdependencies and interrelationships between management areas. Each best management practice is related to other practices in the OE model and implementing all the practices will contribute to creating a culture of excellence that is characterized by the principles. For example, in the Organizational Excellence Framework publication (Ringrose 2010), that integrates the leading OE models (EFQM, Baldrige, Canadian Framework for Excellence, Australian Business Excellence Framework) a customer practice aimed at "determining customer needs and expectations" is directly related to: the leadership practice of "developing a strategic plan with goals and objectives that will guide the organization toward its vision," the planning practice of "using factual information to provide input to the business planning process," the employee practice of "encouraging employees to share their ideas and suggestions," the work processes practice of "involving customers, suppliers and partners in designing and analyzing processes," and the performance measurement practice "measuring the level of service quality."
4. Reduce non-value add activity. Non-value add activity is any activity that does not add value to the organization. Such activity may include errors, rework, duplication, sources of customer and employee dissatisfaction, and activities that do not contribute to the organization's vision and mission. The use of OE models can reduce non-value activity by ensuring that all work activity in the organization is aligned with the vision and mission and by investing in prevention and appraisal activities that reduce failures. In Canada, a study of small and medium enterprises found the cost of quality to be 32% of payroll on average and to be higher in service organizations as compared to manufacturing organizations (NQI 1996).
5. Contribute to becoming an employer of choice. Research has shown that implementing an OE model and concentrating on employee health and wellness can contribute to even greater improvements in organizational performance. Organizations that have an OE model in place undertake human resource planning that supports organizational plans, train and develop employees so they can be valued contributors, encourage employees to share ideas and suggestions aimed at improvement, and reward and recognize strong performance of individuals and teams. These organizations also invest in a healthy workplace. Global research indicates that many organizations are embracing workplace wellness to achieve business objectives such as reducing health care costs, improving productivity, improving workforce morale, and reducing employee absenteeism (Gadowski 2009).
6. Provide a performance benchmarking program. Performance measures common to OE models are used around the world and can be used to track performance internally and compare performance externally with other organizations. While many improvement opportunities are identified by employees doing the work, benchmarking, or learning

from the experience of others is a powerful method for breakthrough thinking, innovation, improvement, and for delivering exceptional bottom-line results.

7. Provide a platform for long-term organizational success. Organizations that have successfully implemented OE models continue to improve their performance year after year. This is largely due to the culture of excellence that has developed. Organizations committed to excellence have leaders that reinforce OE as a strategic imperative and use appreciative inquiry to build on strengths and engage employees in a discussion about what is going well and what can be done better. Both results and the sustainability of OE models are well documented in the aforementioned studies and other global research (Schaefer 2011).
8. Complement other excellence programs. The OE model provides an umbrella under which other programs, initiatives, tools, and techniques can be brought together to form one comprehensive system. The robust OE model can integrate quality assurance programs such as ISO 9001; initiatives such as lean, customer service, health and safety, and environment; and tools and techniques such as Six Sigma.
9. Increase the value of a business. The banking community has recognized that having an OE model in place increases the value of a business. Acknowledging these businesses continue to run well when the owner is absent, some banks add a multiple to the value of a business that has an OE model in place (Greenwood 2010). This bodes well for businesses that wish to increase their line of credit or plan for succession. In addition, an OE model is advantageous for the prospective buyer of a business as the practices provide a good checklist for assessing the business and the balanced system of measurement provides thorough feedback on performance.
10. Provide a healthy return on investment. A recent study found that every $1 spent on a quality management system (i.e., excellence model) returned $6 in revenue, $16 in cost reduction, and $3 in profit and that 93% of organizations agreed that quality management was a significant driver of success (Solomon and Hogan 2012).

## Filling a Gap in the Literature

In 2010, the Organizational Excellence Framework was published (Ringrose 2010). This publication integrated the definitions of the principles and best management practices supplied by the leading OE models and filled a gap in the literature by providing implementation guidelines for the user. These implementation guidelines included the approach and methodology used by seasoned management consulting professionals to implement the best management practices.

The OEF is comprised of principles and best management practices across nine key management areas. The following diagram illustrates each of the principles and key management areas embodied within the OEF. The inner circle of the diagram represents the principles, while the middle and outer circles describe the key management areas (Fig. 1).

### Principles

The principles form the foundation for continual improvement and OE. These principles characterize the culture and values of the organization and depict the way people work together and with their stakeholders. There are nine principles including:

1. Leadership involvement – ensuring senior management is committed and actively involved in establishing and communicating direction
2. Alignment – understanding the organization is a system of interrelated and interconnected work processes and all activities need to be aligned with the established direction
3. Focus on the customer – ensuring the primary aim of everyone in the organization is to understand and meet the needs of the customer
4. People involvement – nurturing and reinforcing cooperation and teamwork and

**Organizational Excellence, Fig. 1** Organizational Excellence Framework

giving employees the opportunity to develop their full potential

5. Prevention-based process management – establishing consistency in work processes and developing a mindset of prevention
6. Partnership development – developing and maintaining value-adding relationships with suppliers and partners
7. Continuous improvement – harnessing the collective knowledge, skills, and creativity of stakeholders to relentlessly pursue improvement
8. Data-based decision making – basing decisions on performance measurement findings
9. Societal commitment – striving to understand and demonstrate corporate commitment to society

These principles permeate the entire OEF and are directly linked to the best management practices in each of the key management areas.

## Key Management Areas

The key management areas are comprised of "best management practices" that contribute to the principles such as:

1. Governance – identifying governance responsibility to stakeholders, implementing an effective governance system, and acting as a model of good practice to internal and external stakeholders
2. Leadership – creating a culture committed to excellence, developing a strategic plan and communicating it to stakeholders, sharing responsibility and accountability throughout the organization, communicating openly about organizational performance, and removing barriers to organizational effectiveness
3. Planning – creating a business plan that aligns with strategic direction, communicating the plan to stakeholders, allocating resources to ensure effective implementation, monitoring and reviewing the plan regularly, and making changes as required
4. Customers – understanding the customer, aligning employees on the importance of the customer, making it easy for the customer to do business and provide feedback, and reaffirming the organization's presence and approach in the marketplace

5. Employees – undertaking human resource planning that supports organizational plans, recruiting, selecting, training, and developing employees, encouraging employees to share suggestions and ideas aimed at improvement, rewarding and recognizing strong performance of individuals and teams, and ensuring a healthy workplace environment
6. Work processes – designing, documenting, and managing work processes, analyzing and improving work processes, taking corrective action when problems occur, preventing recurrence of problems by making changes to work processes, and using benchmarking to evaluate performance
7. Suppliers and partners –using criteria to select suppliers and partners, developing win-win relationships, sharing information about strategic and business plans, and working together to develop products, services, and standards.
8. Resource management – defining resource requirements, developing a strategy to manage resources wisely, managing the adverse impact of operations on the environment and society, and preparing for resource interruptions
9. Continuous improvement and performance measurement – evaluating and improving the approach to each management area, measuring performance in each management area, and measuring overall organizational performance

### Content Template

The publication provides more detail on the best management practices in each of the key management areas by using a content template that includes:

- Statement of the practice or measure(s)
- Definition – the meaning of the statement within the scope of global OE models
- Implementation – a description of how to implement the practice
- Type of organization – an indication of whether the practice is applicable to a large (1000+ employees), medium (101–999), small (26–100), and/or micro (1–25) organization
- Related practices – other practices in the OEF that are related to the practice
- Additional notes – helpful notes regarding application to the public, private, or nonprofit sector, risks that may impact implementation and how to mitigate such, and other sources of information on the practice that may be within or outside the scope of the OEF
- Tags – key words that identify topics within the practice

## Implementing an OE Model

While some organizations harness the knowledge and talent of their employees to implement an OE model, many organizations seek the assistance of a professional. Generally, implementation involves the following key steps:

- Learning about the OE model – read the available literature and take a workshop
- Assessing against the OE model – use a subjective rating scale to self-assess the organization against the principles and an objective rating scale to self-assess against the best management practices of the OE model and make note of the strengths and opportunities for improvement
- Preparing an improvement plan – address opportunities for improvement by preparing action plans that identify the practice that needs work, the chronological tasks to be performed, responsibility, timing, out-of-pocket cost, and the method of measurement that will be used to gauge progress
- Implementing the improvement plan – use a variety of methods to maintain momentum on the excellence journey such as delegating responsibility throughout the organization, using appreciative inquiry, scheduling regular progress meetings, sharing progress in a regular newsletter, hosting guest speakers, going on site visits to high-performing organizations, and holding celebrations when milestones are reached
- Applying for a national award – determine if the organization is located in a country that has a national OE award program and consider applying for an award

- Comparing and learning from the behavior and practice of others – engage in performance and best practice benchmarking to achieve breakthrough improvement in performance

## Conclusion

A challenge remains. Even though 25 years of research has validated the positive relationship between implementing an OE model and improving organizational performance, the author has observed awareness continues to be quite low. It is suggested this lack of awareness contributes to a significant opportunity cost where organizations are not able to improve their performance and grow stronger and ultimately contribute to the economy, trade, and resident quality of life.

A recent study aims to reverse this trend. The "first global assessment on the current state of organizational excellence" was launched by the Organizational Excellence Technical Committee (QMD, ASQ) in 2015. It uses the OEF assessment tool and will report on the extent to which organizations are characterized by the principles and have deployed best management practices. The results will show what is going well and what needs to improve by organization size, industry sector, and geographic region. These results are anticipated to add value for participating organizations and the OE community:

Organizations:

- Increasing awareness about OE models with the working population
- Inviting organizations to start or continue their excellence journey using the OE model of choice
- Encouraging organizations to engage in self-assessment, identify their strengths and opportunities for improvement, and prepare an action-oriented improvement plan to address gaps
- Providing dashboard results to show "current state" by organization size, industry sector, and geographical region
- Encouraging organizations to benchmark their performance with others

OE Community:

- Uniting OE professionals on a common project
- Sharing research results at workshops and conferences and in research papers
- Making organizations aware of national OE and international best practice and benchmarking award programs
- Enabling all countries to participate, in a more competitive and sustainable way, in the global economy
- Making the world a better place for future generations

# Organizational Fields

Besnik Pula
Virginia Tech, Blacksburg, VA, USA

## Synonyms

Field boundaries; Organizational analysis

## Definition

An organizational field is typically defined as an institutionalized domain or sector of society characterized by sets of organizations that share similar goals. The concept is invoked in sociological neo-institutionalist analysis to explain the diffusion of similar norms, policies, organizational forms, and social practices across organizations that are members of an organizational field.

## Introduction

The concept of "organizational field" has been popularized in institutional and organizational research in sociology by the seminal work of DiMaggio and Powell (1983). Still the most widely cited article informing the use of the concept, DiMaggio and Powell reserved a specific theoretical context and meaning for the term. Over the years, the term has been modified and extended, particularly as organizational analysis adopted the use of the concept of "field" from the sociological theory of French sociologist Pierre Bourdieu. These have converged into calls toward a more inclusive and systematic theory of fields. The following discusses the original context and definition of organizational fields by DiMaggio and Powell and its relationship to Bourdieu's concept of field. It concludes with an overview of recent efforts toward a more general sociological field theory.

## Organizational Fields

The concept of organizational field partly builds on inquiries that extended the tradition of organizational analysis from a focus on the study of the internal functioning of single organizations to the relationship between organizations and their social environments. Among influential early theorists, Philip Selznick (1949) examined the relationship between bureaucratic organization and grassroots movements in his famous study of the Tennessee Valley Authority. Likewise, Alvin Gouldner (1954) examined the relationship between an industrial firm and its surrounding community, noting the impact of internal organizational change on values, beliefs, and attitudes of the community from which it recruited most of its labor force. In due time, as Perrow points out,

organizational analysis in sociology "progressively [. . .] begun to catalog things that we should look for 'out there'" (1972, p. 192). The formalization of internal characteristics of organizations into various formal and informal subunits expanded into the analysis of relationships of organizations with other organizations, which in combination formed larger organizational environments, often consisting of organizations characterized by similar structures and modes of operation. Such a focus ultimately problematized the proper unit of analysis in organizational analysis, and debate ensued on the location, scope, boundaries, and functional relationships between organizations and their environments. Some argued that organizational analysis required an ecological approach, in which the study of organizational environments takes precedence over the study of the structure and activities of individual organizations. The natural selection model of Hannan and Freeman (1977) argued that environments determine the survival of organizations best compatible with the demands of their ecology. In this view, organizational structure and activity are ecologically determined. Like organisms in natural selection, organizational environments are first characterized by variation, then by selection and elimination, and finally by the retention of positively selected variations via duplication and reproduction. In arguing for such evolutionary patterns of organizational development and change, ecological theorists do not suggest that organizational forms are selected and retained based on any particular criterion (e.g., efficiency). Instead, they argue that imperatives of survival are determined at the level of population, and thus any set of principles can determine the choice of organizational patterns.

Critics of the ecological school highlighted a number of issues with the approach. First, the study of organizational change from an ecological perspective requires longitudinal studies of large populations of organizations in order to observe and detect the transition from heterogeneity to homogeneity of organizational forms. In most cases, such analyses are constrained by data and other observational limitations. Second, the study of organizational change requires identification of patterns of change at the population level, as the study of a single organization's trajectory (e.g., a firm) would not adequately reveal structural change at the ecological level. Third, there lies a fundamental difficulty with the process of identifying organizational change since treating organizational forms in evolutionary ways inhibits the capacity of the analyst to identify genuinely new formations from mere modifications and adaptations of older forms. Borrowing from biological metaphors, ecological analysis in the study of organizations provides no easy way of determining "whether the new organism is really a different species, a mutation directly related to the old species, or a temporary phenotypic adaptation" (Aldrich and Pfeffer 1976, p. 82). Finally, given that selection mechanisms operate variously and at multiple levels (including criteria of efficiency as well as the fulfillment of a variety of functional needs), criteria determining a population's survival are largely determined retrospectively. Organizational stability and change may thus appear to take place without following any clear logic of organizational or structural succession, given that any arbitrary principle may serve as a determinant of the "fit" between the organization and its environment (e.g., bureaucratic rationality, economic efficiency, adherence to traditional values, etc.). In particular, the theory loses sight of the role of human agency in the making of organizational change, as well as the role of power in the making of organizational structure and behavior.

By contrast, the resource dependence approach saw relationships between organizations and their environments in much more instrumental terms. It begins from the premise that formal organizations are established to pursue collective goals set by constituents (such as owners or members), who therefore subject the organization to frequent performance evaluations. Given that organizations cannot themselves create all resources needed for their survival, they necessarily enter into relationships and carry out transactions with other organizations. Given uneven distributions of resources, organizational environments are characterized by hierarchy and relations of power. This gives rise to behavior among organizations in which leaders attempt to exert control not only within organizations but also to influence their

environment. Such interventions depend on organizational interests; hence, an organization might attempt to create a more hostile environment for its competitors by denying access to specific resources (e.g., raising barriers of entry) or, alternatively, may create structures that enhance capacities for interorganizational cooperation and coordination (e.g., establishing cartels and industrial associations). Hence, in the resource dependence view, environments do not, as in natural selection, play a deterministic role in organizational structure and activity, but rather create constraints and opportunities for strategic action (Zald 1970). The perspective has implications for the view of internal organizational structure and processes. Insofar as their relationship with the environment is instrumental, organizations can develop and use their capacities to enhance their organizational autonomy against their environment. This insulates internal decision-making processes of the organization from environmental influences or imperatives. As a result, there can exist great internal variation among structures, processes, and activities of organizations, insofar as the organization is capable of externally securing resources it does not control via interorganizational networks (such as peers, competitors, suppliers, clients, etc.). This distinction, unlike in the natural selection perspective, makes internal organizational processes interesting and consequential from an analytical point of view, as it does environmental contingencies and opportunities in accounting for organizational change.

The neo-institutionalist view of DiMaggio and Powell begins from the ecological insight on the relative homogeneity of organizational forms and structures. However, DiMaggio and Powell delimit similarity by the organization's structural location within a social domain or "field." Unlike the population-level analysis of ecological approaches, the neo-institutionalist view narrows its definition of organizational sets to particular, societal sectors within which there is routine interaction between varied sets of organizational actors. Hence, the existence of organizational fields must be determined through empirical investigation, based on the institutionalized nature of particular societal activities. As DiMaggio and Powell (1983, p. 148) write,

> [f]ields only exist to the extent that they are institutionally defined. The process of institutional definition, or "structuration," consists of four parts: an increase in the extent of interaction among organizations in the field; the emergence of sharply defined interorganizational structures of domination and patterns of coalition; an increase in the information load with which organizations in a field must contend; and the development of a mutual awareness among participants in a set of organizations that they are involved in a common enterprise.

Organizational fields thus, in addition to creating structured contexts for organizational action, also provide the legitimacy and normative sanctioning of particular organizational forms and actions. The effect of environments on organizations is thus primarily normative. As organizational fields become more institutionalized and organized around common goals and form interorganizational networks, they tend to become more alike in organizational structure and behavior. However, unlike the ecological view, which sees organizational survival as determined by its structural and operational "fit" with the environment, the neo-institutional perspective argues that homogeneity is the result of normative pressures generated within organizational fields. DiMaggio and Powell agree with the ecological approach that a key process at work in organizational fields is that of isomorphism but argue that the ecological approach inadequately conceived isomorphism as the product of competition. They argue that the school neglected the equal – and perhaps more significant – process of isomorphism through institutionalization. While competitive isomorphism may be present in early periods of innovation and experimentation in the establishment of an organizational field, processes of institutionalization over time "structurate" (Giddens 1984) the field by imposing on member organizations not only efficiency or other environmentally given selection criteria but also the need to acquire and maintain social acceptance and legitimacy via recognition, evaluation, and judgment by other organizations. Because ritualistic aspects of the

reproduction of organizational identities and membership are just as important as the individual pursuit of resources and power, institutional isomorphism helps shed light on "the politics and ceremony that pervade much modern organizational life" (1983, p. 150). Thus, unlike the resource dependence view, the neo-institutionalist perspective argues that organizations depend on their environments just as much to negotiate frameworks of action and legitimate organizational structures and tasks, as they do to gain access to material resources. Following a social constructivist view, institutional frameworks created by organizations come to serve as a constraint, as a resource, and as transposable cultural schemas motivating and situating the action of organizations (Meyer and Rowan 1977; Scott 2008). Such insight has been further extended by the institutional logics approach (Friedland and Alford 1991; Thornton et al. 2012), which suggests that individual action and rationality is fully conditioned by the multiplicity of institutional orders the individual actor is located in.

DiMaggio and Powell identify three mechanisms of institutional isomorphism: coercive, mimetic, and normative. Coercive isomorphism occurs when more powerful organizations within a field use formal or informal means to impose demands and requirements or exert pressure on other organizations to conform to rules and norms of behavior which are enforced via coercive means. Coercive isomorphism is therefore most effective when imposed by powerful actors such as the state (e.g., through politically established legal mandates) and dominant organizations (e.g., a monopoly firm imposing quality standards on its suppliers). Thus, the existence of a shared legal framework is itself a powerful force imposing common rules of behavior and organizational forms. Adoption by organizations of coercively imposed mandates is not merely instrumental; rather, even though organizations may initially adopt them for instrumental ends, their institutionalization potentially leads to unintended consequences as they become part of the organization's internal structure and develop distinct sets of interests. Mimetic isomorphism is defined as the adoption by organizations of models, schemas, and modes of behavior from similar organizations in their environment. Organizational actors may consciously borrow forms of organization or modes of behavior from other organizations in response to uncertainty, ambiguity of goals, or the need to gain legitimacy. Organizational forms may also inadvertently diffuse within and even across organizational fields via the role of trade associations and the circulation across organizations of technical staff and consulting agencies advocating or enacting similar models and schemas across different organizations. As a result, mimetic isomorphism may exert much greater effect on the emergence of organizational homogeneity than any particular "rational" criterion such as economic efficiency.

Finally, normative isomorphism is defined as a process of organizational change involving the intersection between the institutionalization of organizational fields and the parallel but partly independent process of professionalization of organizational occupations. As professional groups seek to establish requirements for educational credentials, technical skill, licensing, and standards of ethics, these exert important normative force in structuring the modes of action and behavior within organizations. Such standardization at the formal level is further reinforced when professional groups are drawn from similar social backgrounds and thus, in addition to formal training and organizational experience, also share informal cultural norms spanning such symbolic behaviors such as the use of language, ways of joking, and forms of attire. Hence, in normative isomorphism, at work can be formal demands which require members of professions to go through an established process of formal training (and therefore acquire shared cognitive schemas of problem-solving and decision-making), professional norms that are ritualistically enacted within organizations (e.g., the enactment of procedures formally prescribed by professional groups), the reinforcement of structural homogenization (e.g., the use across an organizational field of a standard system of occupational titles), as well as the more

subtle exchanges in interpersonal social behavior studied by ethnomethodologists and symbolic interactionists. These less formal mechanisms reinforce and reproduce group belonging and diffuse via interpersonal networks information and practical knowledge that enable particular ways for organizational tasks to be performed, judgments to be rendered, decisions to be reached, and barriers of entry to be maintained. They also establish and reinforce hierarchies of status between professions and, insofar as an organization's prestige depends on the status qualities of its professional staff, in creating distinctions between dominant and subordinate organizations within a field. The professionalization of management, particularly as it may come to share within particular organizational fields similar educational credentials and expected career trajectories – and, potentially, even recruitment from a limited set of educational institutions or dominant organizations – may lead to the proliferation of similar managerial styles and cognitive frameworks that diffuse throughout the field.

Critics of neo-institutional analyses of organizational fields have focused on several issues they see as shortcomings of the approach. First, the assumption of organizational homogeneity may obscure important differences across organizations operating in otherwise similar fields, which begs the question of the necessary conditions for the emergence of organizational homogeneity and the perseverance of diversity. Additionally, organizational homogeneity may be more the consequence of coercion and the role of powerful actors than of conformity to shared practices and meanings as the concept of institutional isomorphism suggests (Hirsch 1997; Fligstein 2001). This leads to an analytical bias toward stability and inertia within organizational fields, rather than the study of processes of contention, innovation, and change. Another critique draws from the insights of both rational choice theory and the older institutionalism of the resource dependence variety to point to the limits of the theory in accounting for strategic behavior. Building on their respective research in corporate behavior and social movements, Fligstein and McAdam (2012) attempt to reconcile the existence of shared institutional norms and resources within fields with the exercise of strategic action by organizations. They do so by analytically distinguishing between fields as meso-level institutional domains within which strategic action takes place and "governance units" within institutionalized fields which perform the more "isomorphic" tasks of ensuring compliance with shared values, norms, and rules within fields. However, governance units tend to reinforce values and rules that favor dominant (incumbent) actors and thus serve to reinforce stability and existing hierarchies within fields, against the interests of new entrants and challengers.

By emphasizing the difference between incumbents and challengers, Fligstein and McAdam offer a way of conceptualizing political dynamics within fields, as well as distinguish between periods of field emergence, stability, and crisis. More crucially, in contrast to the neo-institutionalist emphasis on isomorphism and the reproduction of shared values, goals, and cognitive frames, Fligstein and McAdam stress the disjuncture between the very conception of the field by incumbents and challengers. The capacity of dominant actors to impose on other actors a specific definition of the field is itself a form of power they exercise over challengers. This brings Fligstein and McAdam's conception closer to Bourdieu's characterization of field dynamics by uneven distributions of social power in the form of not only economic but also cultural, social, and symbolic "capital" possessed by field participants (Bourdieu and Wacquant 1992; Bourdieu 1993, 1996; Emirbayer and Johnson 2008). However, unlike Bourdieu, who connects the concepts of field and capital with the cognitive dispositions of individual agents embodied in his concept of habitus, Fligstein and McAdam emphasize the importance of "social skill," meant to capture the entrepreneurial action of individuals who mobilize the resources and create the coalitions necessary to effect an institutionalization of a field or transform an existing one.

With their emphasis on contention, Fligstein and McAdam also come closer in line with Bourdieu in defining fields by the stakes they actively generate for participants, as opposed to

the shared values and common goals embodied in their institutions. In this view, fields can be defined more narrowly since they structure interactions between a more definite set of participants. It takes no more than two organizations with similar interests and whose realization of those interests require them to routinely take each other's actions into account to lead to a field's emergence. Organizational fields can therefore be more or less institutionalized, while stakes within fields involve not only the pursuit of material interests but also the terms of the field's institutionalization and routinization of interactions. The dynamics of contention within fields can therefore structure the very things that are prized in them. In this sense, contention within organizational fields structures not only the nature of interactions between participants, but suggests that the "grounds" on which interaction takes place are simultaneously in motion (cf. Warren 1967). Equally important for Fligstein and McAdam is an organizational field's dependence on proximate or neighboring fields. They emphasize the importance of inter-field dynamics in the form of dependence and exogenous shocks that may have implications for the disruption of existing relations of power and the reorganization of stakes within fields. An important implication of this is that the state, rather than serving primarily as an institutional framework for organizations, functions as an autonomous field in its own right, where changing stakes and interests may be consequential for those in organizational fields that depend on it. Similarly, Bourdieu distinguishes between the state as a political institution and the state as a bureaucratic field, through which the institutionalization of specific forms of field-relevant capitals (such as cultural capital obtained through formal educational credentials) are "consecrated" and made "convertible" for other forms of capital and serve to structure contention in other dependent fields (Bourdieu 1999).

## Conclusion

The concept of organizational field emerged as a response of sociological neo-institutionalists to the limits of both ecological and resource dependence approaches to the study of organizations. The seminal work of DiMaggio and Powell was particularly influential in outlining the basic framework involved in the analysis of organizational fields and remains the most cited work informing the use of the concept. Since then, there have been efforts to expand and develop field theory as a distinct approach and method for the analysis not only of organizational behavior but also the logic of individual action (Martin 2003). The inspiration and motivation to develop a more comprehensive theory and methodology of field analysis came from the work of Bourdieu, who placed the logics of fields at the core of his sociological project. Drawing from both the neo-institutionalist tradition and Bourdieu, Fligstein and McAdam have reframed sociological field theory in ways that can account for both the perseverance of institutionalized routines and behaviors within fields and strategic action at the organizational level.

# Organizational Humanism

Eric E. Otenyo
Northern Arizona University, Flagstaff, AZ, USA

## Synonyms

Humanistic organizations; Humanistic philosophy in organizations

## Definition

Public administration scholars Michael Milakovich and George Gordon define organizational humanism as "a set of organizational theories stressing that work holds intrinsic interest for the worker, that workers seek satisfaction in their work, that they want to work rather than avoid it, and that they can be motivated through systems of positive incentives, such as participation on decision-making and public recognition for work well done" (2007, p. 167).

## Introduction

Organizational humanism emerged from the quest for increased workplace productivity and worker satisfaction and the organizational relations thereof. Management theorists had been thinking and making observations about behaviors of humans in organizations. A good number of scholars in the management field attempted to position the field as a science and wanted to minimize philosophical and humanistic traditions. The initial laboratory for these scholars' observations were industrial settings and large corporations, hence the earlier references to industrial humanism, as a core school in modern organization theory. The human part of studies of behavior was attributed to pioneering work seeking to apply psychology to organizational contexts.

As a modern management concept, organizational humanism proliferated and is now influential in management practices and decision-making. The concept associates the personal growth of employees to organizational success and now includes ethical insights that foster group understanding and cooperation in organizational life. Humanistic values are said to provide avenues for workers to realize their full potential, which results in increased organizational efficiency and effectiveness.

## Evolution of Ideas

Following Elton Mayo's (1924) keen attention to the concept of "the nature of man," much of the work on organizational humanism was based on theories advanced by scholars working from psychological perspectives. Mayo's earlier work was

richly philosophical, interrogating long-standing questions of moral dimensions. The normative and practical dimension of this body of work partly explains the drive to find ways to motivate people working in organizational settings. Stated differently, the objective of the human-focused work established theoretical foundations for exploring psychological and social means for ensuring greater productivity through efficient operations in organizations. Basically, Mayo's ideas moved the frontier beyond Frederick Taylor's scientific management movement, which had created a sense of alienation and provided foundations for the new humanistic territory.

From a chronological view, the organizational humanists elaborated on work that had been done by experiments borne out of the scientific management school and the human relations approach. More importantly, the Hawthorne studies (1927–1932) led by Fritz Roethlisberger and Elton Mayo of Harvard University had theorized physical conditions at work directly affected productivity (Roethlisberger 1941). Their experiment revealed increased productivity was a function of several social and psychological factors beyond the hypothesized physical conditions of the work environment. In addition, the studies pointed to "a more complex model of worker motivation based on a social psychological rather than an economic conception of man" (Scott and Davis 2007, p. 65). This finding led to the development of ideas that appreciated the role of a humanized workplace. In other words, human factors, including motivation of workers, were critical to organizational efficiency.

In some ways, key discussions about motivation stem from the work of psychologist, Abraham Maslow (1943). His pioneering analysis laid the foundation for subsequent research of motivation theories. Maslow outlines a theory of hierarchy of needs in which he ranked human needs according to what he believed to be representation of human behavior. In his theory, the lowest level of needs had to be responded to before others. This meant that an individual had to meet their basic *"physiological"* needs before striving for high order needs. The most basic human needs such as food and sleep were at the lowest level of his ladder. These are the starting point for motivation theory.

The next level of needs included security from harm followed by the third level, which included the need for esteem, love, and belongingness. Still, according to Maslow, there is a fourth level of needs, that is, to gain respect from others and also self-respect. The highest level was the need for self-actualization, which meant an individual was pleased with their personal growth and development, for the most part. Such self-actualized members of organizations assimilated their work to the extent that work identified the individual. Stated differently, self-actualization meant individuals realized their full potential as human beings.

Although Maslow's functionalist work was a general explanation for human behavior, organizational theorists embraced and applied it to organizational settings. Managers thought people were better motivated if and when provided with incentives that led to self-actualization. In other words, self-actualizing individuals were most likely to achieve the highest level of self-fulfillment when conducting work-related chores. Maslow made it clear that motivation theory was not the same thing as behavior theory and that the motivations are only one class of the determinants of human behavior. He asserted that both culture and situation were important variables in determination of the form of behavior.

One of the best-known pioneers in the general theory of organizational humanism is Douglas (McGregor 1985). His work is described in a famous book, the *Human Side of Enterprise* is a defining statement on aspects of intrinsic and extrinsic rewards in organizational behavior. McGregor changed the way we think about the relationships between people and organizations in which they work. According to McGregor, two underlying belief systems undergird motivations in the organizations. He referred to the belief systems or models as Theory X and Theory Y. For McGregor, the traditional organizational thinking is Theory X, characterized by the following three basic assumptions and ideas: (a) That the average person dislikes work and will often avoid doing work, wherever possible. (b) Building from (a), most people have to be threatened, controlled,

directed, or coerced in order to get them to work toward attainment of organizational goals. (c) And, that the average worker, unambitious as he/she is, prefers to be directed and is interested in security above other values.

McGregor suggested a rival theory, which he called Theory Y, a set of ideas that exemplified core values in industrial humanism. In Theory Y sets of beliefs, (a) most members of organizations are okay with work and find work as natural as play. (b) Workers are capable of self-control and do not need much of external control and threats of punishment. He argued people would generally exercise self-direction and strive to achieve organizational goals on their own. (c) The third set of beliefs in the Theory Y framework is that workers, for the most part, have a capacity to exercise imagination, creativity, and ingenuity in solving organizational problems. McGregor believed that motivation was dependent upon group actions and that other things other than money were important in ensuring organizational success. He also supported the idea of participative decision-making in organizations.

From a practical standpoint, the design of organizational structures can be influenced by which ever set of assumptions are drawn from assumptions and beliefs in either Theory X or Theory. And building from McGregor's work were other theorists of organizational behavior, which contend that people in organizations desire to grow together, under conducive circumstances. Ultimately, the goal is that organizational humanism is both a means to an end and an end in itself.

Social psychologist Rensis Likert (1961), who is famous for developing the 5-point Likert scales, expanded the organizational humanist perspective by focusing attention to the role of group support in organizations. The key tenet of his perspective is that when members of an organization foster supportive relationships and when members maintain a sense of personal worth and importance, the organization benefits. In other words, organizational management benefits by putting in place mechanisms that promote groups' cohesion at the different levels of the organization.

Likert advocated for groups participation in organizational decision-making arguing that doing so increased motivation. Participation entails enabling members to contribute to decisions that affect them in the workplace. In some ways this is an ideology for equality and minimalist subordination to direction from leaders while maximizing opportunities for participation in decision-making. In this optimistic analysis of membership in organizations, the focus is on individuals working as a part of a team. Thus, based on his fieldwork, he argued that by providing supportive conditions, organizational members are likely to be more productive. Warren Bennis (1966) revamped this idea by calling for democracy in organizations as a managerial strategy preferable to autocratic forms of organizational management.

## Applications of Organizational Humanism

Do organizations apply the theoretical perspectives outlined above? Various consultants and experts of organizational behavior have provided insights into just how the ideas of organizational humanism scholars have found favor in the field. In an effort to achieve high levels of productivity, organizations have, for example, internalized Maslow's hierarchy of needs in various ways. For example, managers support workers in their goal of meeting physiological needs through sensitivity in designing livable and minimum wages and salaries. In many instances, benefit systems, including pension schemes and workplace safety programs, are couched in a language that embraces values cognizant of the security needs of employees. In addition, workplaces increasingly reflect the appreciation of camaraderie or "belongingness needs," as captured in cooperative and team-building initiatives. It is simple to see how one might relate self-actualization to policies that encourage members of organizations to perform challenging work and also enjoy greater autonomy in effecting job-related operations and tasks. While at organizational levels these observable applications are not necessarily the outcomes

of Maslow's theory, his insights are analytically helpful for managers seeking to act humanely, especially, in situations where cutback management is necessary.

Furthermore, no one denies the usefulness of participative decision-making. In theory, members of organizations involved in making operational decisions are likely to be more productive. Experts add that to apply Maslow and other organizational humanism concepts, organizations have typically designed workplaces to allow for social interactions, which in turn promote a sense of belonging and engender self-worthiness and esteem. Another powerful tool for motivation is enabling workers to further their educations and improve on skills, abilities, and knowledge. Training and development opportunities clearly are in line with Maslow's basic idea of supporting an employee's own self-actualization needs. Experts of human resource development and organizational psychology recognize the importance of this need (Foulds 1970; Gilligan 1974; Swanson and Holton III 2009, p. 153).

Many scholars have added voice to McGregor's insights on motivations. For example, Sorensen and Minahan (2011) reviewed applications of McGregor's concepts developed in *The Human Side of Enterprise*. Their paper found strong evidence that Theory Y concepts had widespread applications in modern organizations. In addition, they suggested that McGregor's work was supported in different cultural settings and was an important universally applicable management theory. For instance, delegation and decentralization are concepts that one may easily associate with the tenets of Theory Y.

Beyond decentralization, McGregor's Theory Y, organizational humanists influenced work on leadership by giving emphasis on participative decision-making styles and advancing the idea of ownership in organizational outcomes. Likert's work (1961) gave strong support for consultative management practices and remains influential to this day and has been implemented in some of the leading corporations. Various manifestations of humanism have been articulated in hundreds of scholarship on organizational effectiveness.

## Challenging Organizational Humanism

While we acknowledge the enormous contributions of organizational humanism and the practical applications in private, public, hybrid, nonprofits, and other forms of organizations, there are perceived observable limitations to the theories. Modern research suggests that testing Maslow's ideas has generally been limited and empirical data is scanty. Although Maslow's seminal work has been well established, critics argue that the hierarchy of needs model is inapplicable in a collectivist cultural setting. The argument is that in such settings, the basic need is belonging and self-esteem takes a back seat. Collectivist cultures are common in places such as China and many non-Western societies where self-actualization is attained when societal and group needs flourish (Gambrel and Cianci 2003).

There is also criticism that the underlying assumption that employees are alike fails to capture the obvious diversity among organizational members. In some ways, there is also claim that organizational humanists focused more on ideas about job satisfaction rather than motivation theory.

Key critics of the needs approach of motivation argued that the theory made unrealistic assumptions about workers in general. Specifically, employees were not a homogeneous group and situational differences structured organizational behaviors. Research also rejected the notion that all workers sought to participate in decision-making. Further, the idea that there is one "best" way to meet needs was flawed at its core because worker's needs were not uniform. The needs theory proved to be realistic only in descriptions of the behavior of individuals said to be high in enhancing growth needs. These were essentially individuals who wanted to achieve certain needs, which of course did not include those with contrary views about higher-level satisfactions.

Recent studies also add the neglected area of workplace spirituality, which many observers believe is an aspect of organizational humanism and merits further scholarly research (Jurkiewicz and Giacalone 2004). Koltko-Rivera (2006) also draws our attention to Maslow's revision of his

work and addition of self-transcendence as a motivational step beyond self-actualization.

As for McGregor's normative philosophy of management, critics commented its validity was not testable by neutral methods of social and behavioral science. To some extent, assumptions under both Theory X and Theory Y were regarded as self-fulfilling prophecies and become true by virtue of one's commitment to them (Harmon and Mayer 1986, p. 212). Critics argued that managers evoked the kinds of behavior in subordinates that conformed to their unconscious views about subordinate motivations.

And there is a feminist perspective, which challenged managerial practices that minimized the concern for principles of feminine leadership. Feminine leadership is said to offer more meaningful interpersonal relationships in the workplace. This thought is articulated in Carol Edlund's (1992) work among others. Edlund correctly observed that feminist leadership theory's intellectual home is in the human relations' theory and adds that the humanistic perspective was about energizing groups for organizational success (p. 81). Her work recognized attributes such as respect for workers and elimination of managerial masculine traits like domination and aggression for the good of organizations.

In a nutshell, organizational humanism failed to account for the varied needs of members of organizations. The approach also paid little attention to the kinds of work performed and failed to differentiate between automated and routine tasks from nonroutine tasks. These kinds of criticism were inevitable, given the complexities in organizational life. On the whole, those who study organizations believe the contributions of organizational humanism are an influential body of literature.

## Conclusion

Scholars of organizational humanism have labored to establish the intrinsic value of the satisfaction of human needs in organizations as opposed to the view that satisfaction is a means for increased productivity. The lesson from organizational humanism is that managers ought to take care of the needs and desires of people in organizations. To do so is a step toward helping organizational members find congruence between their individual needs and the organization's objectives and mission. Thanks to insights from motivation theorists, who include writers in the humanist traditions. Today, expressions of humanism at work are manifest in ideas such as ergonomics, job enrichment, and participatory decision-making models, redesign of work to make it more exciting and challenging, flextime initiatives, and so on. Organizational humanism is about projecting human values into bureaucratic life including framing the strategies in public interest terms (Dvorin and Simmons 1972). Yet, we also recognize that motivation is elusive and people in organizations are not all motivated by desires for self-actualization, money, prestige, or power. The variations are vast and so are the different views about what makes them tick. Organizational humanism is one way of understanding complexities and dynamics of everyday organizational life.

## Synonyms

Collective identity; Identity

## Definition

This chapter provides an introduction to organizational identity and paradigms for understanding organizational identity.

## Introduction

Organizational identity emerged out of the field of organizational behavior when in 1979, two scholars at the University of Illinois observed as colleagues panicked when a cut in the university's budget was announced by the state legislature. Organizational members questioned what it meant to be the "University of Illinois" or a university at all. Each member of the organization feared what it would mean to their sense of who they were if a department was cut back or cut out altogether. This experience demonstrated to pioneers Stuart Albert and David Whetten that "concerns about identity are just as profound as concerns about survival" (Whetten and Godfrey 1998, p. viii). The scholars, having no frame with which to understand the phenomenon observed, invented the term "organizational identity" drawing on conceptions of identity in related disciplines. This theoretical lens then became the foundation for the interpretive framework with which scholars have since understood identity in organizations.

As seen with the University of Illinois in 1979, "threats to an agreed-on identity characteristic will strongly influence an organization's performance [and legitimacy] because its very performance depends on internal and external perceptions of its legitimacy …which in turn affects its ability to access needed resources… Thus, organizations have a strategic interest in establishing and maintaining an identity destined to be positive in relation to institutionalized consensus" (Rockwell 2016, p. 15).

For faculty at the University of Illinois, many feared how the university would be perceived following a budget cut. Similarly, organizational identity provides other organizations with a screen through which members make sense of their experience in the organization. Organizational identity influences members as well as external publics. It can motivate performance and commitment. Over the last couple of decades, the field of organizational identity has received a lot of attention from scholars interested in understanding how organizations define themselves, how these definitions of "who we are" emerge and how identity

interacts with other organizational phenomena such as organizational culture, image, leadership, and organizational change. This chapter provides a cursory look at organizational identity and paradigmatic approaches from which organizational identity has been understood and studied.

## What Is Organizational Identity?

Organizational identity sits at the core of how members make sense of what the organization is. A positive organizational identity will bring about strong commitment and loyalty from organizational members. Negative identities, however, threaten members' self-perception and may have the opposite effect. Organizational identity also serves to influence external stakeholders and organizational publics who, through organizational image and messaging, begin to form identification with the organization and grow pursuit intentions. It gives "sense to both insiders and outsiders about the mission of the organization and how it intends to achieve that purpose" (Gioia et al. 2013, p. 164). Organizational identity serves as the interpretive lens for self-perception and self-reflection. It anchors the organization as it answers the questions: "Who are we as an organization?" and "What do we stand for?" It is at the essence of the organization referring to those attributes of the organization that are central, enduring, and distinctive.

*Centrality* of organizational identity means those aspects of "who we are" that sit at the core of this self-perception. This is perhaps the most fundamental as without a core, there is no identity. These will include the organization's core values which inform its core processes and practices. *Distinctiveness* means those aspects of the identity that members perceive as distinguishing the organization from other similar organizations. It is the value of being different and unique. Optimal distinctiveness is the ideal spot organizations want to hold where they are similar enough as to be recognizable, yet, so distinct that they are like no other. *Enduring* characteristics means that identity retains its core over time. They are "features that exhibit some degree of sameness or continuity over time" (Albert and Whetten 1985, p. 265). Although there are arguments in the literature about whether in fact identity does remain the same, it is generally agreed on that to an extent, a sense of identity remains core over time but is adaptable to accommodate changes in market and industry.

A commonly confused distinction is between "organizational identity," "image," and "reputation." Professors of management, Jane Dutton and Janet Dukerich in their 1991 study of the Port Authority of New York and New Jersey clarified this distinction. According to these scholars, "an organization's identity describes what its members believe to be its character; an organization's image describes attributes members believe people outside the organization use to distinguish it . . . [while] reputation describes the actual attributes outsiders ascribe to an organization" (Dutton and Dukerich 1991, p. 547). The organization's reputation and image among external stakeholders holds influence over the organization and its sense of identity. This is because the organization's image serves as a mirror of the organization and its members. As members mirror themselves in the organization's reputation, they make efforts to either correct these perspectives or change their own practices internally. Thus, Hatch and Schultz (2002) described "organizational culture as the context. . .[for] internal definitions of organizational identity, and organizational images as the site of external definitions of organizational identity" (p. 991).

What organizational identity is as a theoretical concept and what it is as a phenomenon within organizations are constantly contested and debated. Below are some of the paradigmatic approaches through which organizational identity is understood.

## Paradigmatic Approaches to Understanding Organizational Identity

Rockwell (2016) discussed three "paradigms that explain how identity emerges" (p. 15). These are perspectives through which scholars have looked at and studied organizational identity. These stem from fundamental truths about a scholar's paradigmatic worldview. Rockwell (2016) listed the linguistic-discursive paradigm, social actor paradigm, and the social-constructionist paradigm.

Gioia et al. (2013) in their article, list four perspectives: population ecologist, institutionalist, social actor, and social constructionist paradigms. In this section, I will start by providing brief summaries of the three views not accounted for in both studies (linguistic-discursive, political ecologist and institutionalist paradigms) and then provide an extensive discussion on the social actor and social constructionist views. These later two are the most common paradigms.

First is the linguistic-discursive paradigm. Here, organizational identity is seen as being formed through linguistic processes. It "is the result of a continuously narrated argument... [and develops on] how language constructs what the reality of the organization is for members" (Rockwell 2016, p. 15). This may perhaps be thought of as a Rhetorical view of organizational identity. Cheney (1983) wrote about the dimensions of rhetoric in organizational identification. In this view, metaphors, storytelling, categorizations, labels, names, political plays, and other linguistic-cum-rhetorical tools are used in constructing identity. It involves "ongoing narration, involving creating, adjusting, affirming, and rejecting various interpretations" (Rockwell 2016, p. 16).

Next is the political ecologist paradigm. This paradigm sees organizational identity as externally defined and held by publics outside the organization. In this view, an organization's identity is what these external publics say or understand it to be. This identity is often developed through group or category membership such as the industry the organization is in. This view also takes identity as stable and unchanging owing to structural inertia ("a correspondence between a class of organizations and their environments" Hannan and Freeman 1984, p. 151) and institutional pressures. Scholars who hold this view argue that external publics hold institutional "identity codes" which spell out the expected behaviors of organizations within a certain category or industry. Adhering to these codes leads to legitimacy while deviation causes devaluation and may also pose threats to the organization's survival. While this view makes sense, Gioia et al. (2013) argued that the population ecologists do not study organizational identity. Rather, what studies that have adopted this paradigm have fallen for is a mislabeling of the concept of image. As described earlier, organizational identity is internal stakeholders' self-perception. What external publics perceive and hold is the image and the reputation of the organization – rather than its identity.

This is not to dismiss the importance of organizational image. "Image is directly related to the level of collective self-esteem derivable from organizational membership" (Dutton and Dukerich 1991, p. 548). "The way in which organizational members are perceived by customers, competitors and the like, can influence organizational identity [and members' self-concepts] as members mirror themselves in the comments (and complaints) about the organization" (Hatch and Schultz 1997, p. 362). "Damage to the organization's image hurt individuals personally" (Dutton and Dukerich 1991, p. 548). "Individuals are [thus] personally motivated to preserve a positive organizational image and repair a negative one" (Dutton and Dukerich 1991, p. 548). These actions in response to image may then lead to conformity with industry standards or "identity codes" as political ecologists provide.

Furthermore, there is the institutionalist paradigm in studying organizational identity. Unlike the population ecologist paradigm, identity here is seen as internally defined. Similar to the population ecologist paradigm, however, it sees organizations as isomorphic due to being highly socialized and conditioned by strong institutional influences. There is an emphasis on institutional processes as a way of "institutionalizing identity" and less on the distinctiveness of organizational identity. In addition, much of the institutionalist paradigm has seen identity as stable and homogenous just as they saw the rest of the organization and institutional aspects. Organizational identity – "as [with] most other institutional aspects – was treated as given and essentially fully-formed" (Gioia et al. 2013, p. 171). Studies thus only served to show the strong influence of institutions on making homogenous organizational processes and even identity. Thus, emphasis in this view is on legitimacy and mimetism among

organizations. There has, however, been a surge in recent years on recognizing the dynamism of organizational identity and an alignment of the institutional view with the more traditional organizational identity research views which I now turn to a discussion of.

The traditional views or paradigms for studying organizational identity are the social actor and social constructionist paradigms. These views see identity as dynamic and are more similar to each other than the others. They are the dominant perspectives through which organizational identity is studied. They see organizational identity as self-referential and defined within the organization rather than by outsiders or by institutional isomorphism. The social actor paradigm sees the organizational entity as a social actor whose character is put on display through organizational identity. Identity is thus "an objective property of the organizational entity" (Rockwell 2016, p. 15).

In this view, organizational identity claims are held by organizational leaders and communicated to members to explain "who we are." That is, organizational leaders determine the organizational identity. The social actor paradigm seems to assume that statements made by leaders about "who we are" are correct and describe accurate and fixed features about the organization. Thus, a study adopting this paradigm will understand organizational identity from the perspective of the leader and pay attention to overt claims made by leaders when they are speaking of the organization's identity.

Criticisms levelled against the social actor view address its emphasis on organizational identity claims. One way to look at it is that OI claims do not necessarily represent organizational identity as experienced by and held in the minds of organizational members. Gioia et al. (2013) reported that it leads to reliance on "projected images the organization hopes others will accept as legitimate" (p. 170). Rockwell (2016) also highlighted the role given to organizational leaders in this view. While it is true that "founders and leaders' beliefs and values" are key to organizational identity formation, there is perhaps too much of a reliance on the organizational leader within the social actor paradigm.

While organizational leaders often serve as rudder for identity, synthesize OI claims, resolve identity ambiguity, and provide basis for organizational members and external publics to understand "who we are" as an organization, organizational leaders alone do not determine what becomes the identity of the organization. This follows the social constructionist view of organizational identity. A founder's blueprints are vital to the life of an organization but without understanding from members, there really is no organizational identity only OI claims. There has to be space for negotiating the organization's identity as members need to connect OI claims to their own prior experiences. Through a process of sensemaking, they need to interpret the identity for themselves before buying into it. This co-construction forms a "community identity" which is a step in the process towards organizational identity. This community or collective identity is formed and reinforced in the organizational narrative or storytelling (Wertsch 2012).

Organizational members' participation in negotiating identity, however, results in increased loyalty and connectedness to the organization. "It is valuable for organizations when coworkers not only feel that they were asked . . . but that they were actually the drivers" (Madsen 2016, p. 218) in the discursive processes leading to the formation of organizational identity. This way, they see identity as more authentic and are simultaneously equipped to represent the organization and speak strongly on its behalf among external publics.

This later view is what separates the last paradigm, the social constructionist paradigm, from all others. That is, the belief that organizational identity is coconstructed through the deliberations and daily interactions of organizational members over time (Ran and Golden 2011). Coupland and Brown (2004) metaphorically described this as a "discursive achievement" wherein stakeholders (i.e., organizational members) are rhetors in debate over identity. This view recognizes identity as dynamic (changing) as opposed to static (enduring). Identity is seen as "more malleable, less the product of senior executives' decisions and more open to political influence at different

levels, and less clearly defined and more ambiguous" (He and Brown 2013, p. 9).

For social constructionists, "identity is created and sustained through the sensemaking interactions and interpretations of organization members and stakeholders" (Rockwell 2016, p. 15). Identity is "continually under construction" (Madsen 2016, p. 202) through the "co-evolution of claims and understandings. . . and their interplay" (Gioia et al. 2013, p. 160). Understanding reflects members' sensemaking of OI claims and publics' reactions to these claims. "Understandings become self-reinforcing because they continue to shape successive perceptions, behaviors, and experiences" (Rockwell 2016, p. 15).

## Conclusion

This chapter provided a cursory look at organizational identity and paradigmatic approaches to studying and understanding identity. Irrespective of paradigmatic approach, most scholars seem to agree that organizational identity is constituted of core and distinguishing attributes which may be enduring. Identity has thus been studied on its merit in building stakeholder loyalty and commitment. It has also been studied in relation to organizational image, organizational culture, leadership, and vision among others. Depending on a scholars' paradigm, however, organizational identity is looked at and understood from the linguistic-discursive, political ecologist, institutionalist, social actor, and social constructionist paradigms.

# Organizational Identity Leadership

Alexandra Rheinhardt
Pennsylvania State University, University Park, PA, USA

## Synonyms

Identity management; Leadership influence

## Definition

The term "identity leadership" refers to the management of followers' identities by their leader.

Leaders approach this process through many angles, with some attempting to manage all three levels of followers' workplace identities (i.e., collective, relational, and personal) and others centering attention on but one or two of their followers' levels of identity. This management is at times very deliberate and at other times appears to be subconscious.

## Introduction

There is substantial disparity in the academic literature regarding identity leadership, with many not even acknowledging this term. To date, this fragmented approach has addressed leaders influencing subsets of their (individual) followers' self-concepts. As a result, a leader's potential influence on the full leader/follower relationship has not simultaneously been examined. Pulling together these parts, identity leadership takes a broader approach, encompassing the leader's management of the three levels of a follower's self-concept within the leader/follower relationship. Identity leadership may include the follower as an individual, the follower as a dyadic partner with the leader, and the follower as a member of the collective led by the leader.

Efforts examining charismatic leadership note that both followers' personal identification with their leader and collective identification with the group led by the leader are paramount to the charismatic process. With a different approach, leader-member exchange (LMX) literature recognizes the impact followers' relational identification with leader/follower relationships has in organizational settings. And work on transformational leadership takes a slightly different view and addresses the impact that followers' collective and relational identities, involving the organization and their relationship with their leader, have in the workplace setting.

While these contributions have all addressed followers' identities and identification, as well as proven valuable in providing insight into leadership methodology, they have largely brushed over the assertive roles that leaders engage in through their efforts to activate their followers' relevant identities. More recently, however, Steffens et al. (2014) recognized that organizational leaders consciously attempt to influence their followers' collective levels of identity in the process that they referred to as *identity leadership*. Again, this effort, as well as several others, centered on a single collective workplace identity and its corresponding identification process.

## The Significance of Identity Leadership

Even though prior literatures have not always looked at identity leadership with a holistic approach, scholars have recognized its significance as followers' identities are what inform the followers' organizational attitudes and behaviors. This is what has prompted many leaders to view the activation of followers' identities as a mechanism that may lead to desired organizational outcomes. At times, it may prove true that all levels of a follower's identity need not be activated for the leader to achieve their desired results, yet it has been suggested that the activation of a complementary identity can strengthen other identities which share commonalities.

In each of the follower's roles within the leader/follower relationship, the follower's attitudes and behaviors are informed quite differently. As a collective member, the follower's identity informs them that their attitudes must be supportive of, and their behaviors beneficial to, the collective they are a member of, enabling the individual follower's needs for belongingness and acceptance to be met. As a partner in the leader/follower dyadic relationship, a follower's identity informs them that their attitudes must be supportive of, and their behaviors beneficial to, both the leader and their relationship in order to maintain their relationship so that their need for interdependence is met. And, as an individual, a follower's identity informs them that their attitudes must be supportive of, and their behaviors beneficial to, their distinctiveness so that their

need for being a unique individual is met (Brewer and Gardner 1996). From an organizational perspective, the fulfillment of these needs, singularly and/or combined, may lead to increased follower satisfaction and/or productivity. However, it has been inferred that, if mismanaged, these identities may conflict and lead to internal follower tension.

## Management of Followers' Identities

The management of identities is not a homogeneous process as identities are unique in both the needs that serve as their motivation and the desired attitudes and behaviors which they elicit (Leary and Tangney 2011). At the same time, there is a systematic approach that is common among many when they embark upon this process. This involves the activation of the specific identity, an emphasis on the positive characteristics of the identity, reinforcement of the significance of the identity, and a pathway which facilitates the fulfillment of the needs associated with the identity.

## Collective Identity and Identification

Leaders target the collective that is led by the leader, and to a lesser extent with the leader as a prototypical member or representative of that collective, when attempting to spur a follower's collective identification. This collective is often a work group, department, division, or even the entire organization depending on the level of the leader within the organization being examined. Regardless of who the particular leader or collective is, tactics are geared toward emphasizing the collective and specifically prominent and positive features of the collective. The leader attempts to frame these collective characteristics in a way that they appear to be highly compatible with the follower's own personal characteristics or, at times, even suggest that they are fully shared by followers. Leaders also may contrast their collective with other collectives in attempts to portray their collective's superiority. This entails the leader emphasizing the strengths of their group in relation to the weaknesses of a comparative collective and/or depicting what is unique and distinct about their collective compared to others (Ashforth and Mael 1989).

Leaders may also actively portray themselves as prototypical of the collective. This strategy centers on the leader portraying that followers not only share commonalities with the organization but more specifically that the follower shares the common organizational characteristics with the leader himself/herself. This is particularly important because the leader emerges as an ideal model of the collective and thus as a guide for followers to rely upon in shaping their collective identities which will ultimately inform their attitudes and behaviors.

The leader may attempt to spur followers' collective identifications through use of direct or indirect communication, role modeling behaviors, and/or symbolic tactics. The selected approach often depends on the proximity of the leader to his/her followers (Shamir 1995). CEOs, presidents, and other top leaders rarely, if ever, come into direct contact with all of their followers; thus, distant leaders often rely on written communication tactics (i.e., letters to employees), corporate policies that emphasize the collective (i.e., organizational-wide incentives corresponding to organizational performance), and/or other collective-emphasizing approaches (i.e., company picnics) (Brickson 2000). These same approaches may be utilized by more proximal leaders such as direct supervisors, though they are also able to engage in more frequent verbal communication that may additionally highlight the collective. One study suggests that using collective language (we/them) as opposed to self-directed language (I/me) helps to shift individuals' self-concepts to their collective level of identity (Gardner et al. 1999).

A collective identity emerges when the follower collectively identifies with the needs to belong and be accepted rising as the primary motivations that inform their attitudes and behaviors. It becomes the leader's objective to spur this follower's collective identification because it strengthens the follower's corresponding collective identity which may prompt follower

satisfaction with the organization. It has been suggested that this follower satisfaction promotes the follower's commitment to the collective, group cohesiveness, and the individual's behaviors that are oriented toward achieving the leader's/collective's vision and objectives (Ashforth and Mael 1989). This, in part, is the basis for leaders striving to cultivate followers' collective identifications which lead to strong and informing collective identities.

## Personal Identity and Identification

Follower's personal identification with their leader involves the follower identifying with the leader's personal characteristics and traits rather than merely identifying with their leader as a representative of their collective such as in collective identification. This identification may occur through one of two routes (Kark and Shamir 2013). First, the follower may recognize that they share personal commonalities with their leader. This form of identification is reflected in the example of a follower who views himself/herself as creative and therefore personally identifies with their leader whom they also perceive as being creative. It is the follower's perception of leader/follower similarities that prompts the personal identification. Followers don't always recognize shared similarities, however, but instead reshape their own personal identities through incorporating admirable personal identity traits that are evidenced by their leader. This in effect is a form of role modeling with the leader serving as a guide for facilitating the followers' personal identity formation. The specific path to personal identification is of minimal consequence as long as an interpersonal comparison is extant which to some degree involves the follower comparing their personal identity traits with their leader's identity traits (Ashforth et al. 2015).

The follower's active role in the personal identification process, which entails leader/follower identity trait comparisons, is often assertively initiated by the leader. To begin, a leader may intentionally and actively portray himself/herself in a positive light through either their discourse or role modeling behaviors. It has been suggested that this may be more effective with distant leadership as the follower does not have the opportunity to frequently interact with the leader. Indeed, what may occur is that the follower may identify with an idealized image of the leader that may have been constructed by the leader himself/herself, the media, and/or other organizational members and which ultimately filters through the organizational hierarchy. The follower is unable to see all dimensions of the leader, including those that are less positive, and therefore, the potential for identification mitigation is limited due to the absence of proximal interaction (Waldman and Yammarino 1999). It can be argued that this distant personal identification does not truly exist or is inherently flawed as it is centered on idealized identity traits. Others rationalize that followers may still come to personally identify with the leader on the basis of these idealized qualities and have pointed to empirical work that supports the notion that individuals are able to personally identify with fictitious identity characteristics (Igartua 2010).

Leaders may also initiate this identification process by creating situations that are perceived by followers to be opportunities or threats. This method positions the follower so that he/she is able to evaluate their applicable (the follower's) abilities to cope with the accompanying challenges. Followers often then recognize that they have personal identity deficits and look to their leaders as models for comparison so that identity characteristics can be cultivated that better enable them to confront the challenges (Ashforth et al. 2015). As a clarifying example, a leader may set a new and demanding sales quota for their employees to meet. A follower who senses they are unable to meet this quota, and who views this situation as either an opportunity to improve or a threat to their job, may look to their leader as a model. The leader's characteristics that appear to be conducive to success, such as tenacity, commitment, thoroughness, compassion, etc., may then become traits that the follower seeks to incorporate within their own identity.

An individual is primarily motivated by self-interest, and their attitudes and behaviors are informed by their distinct characteristics when

their personal level of identity is activated (Brewer and Gardner 1996). Followers, who personally identify with their leader, are therefore ideally motivated by the mission, vision, and values they share with their leader and therefore engage in behaviors that are consistent with the achievement of the leader's objectives as well as that increase their commitment to both their leader and organization.

## Relational Identity and Identification

Relational identification involves a relational partner identifying with the relationship they share with another individual. This process culminates in the development of an associated relational identity that is greater than the sum of each relationship member's role identity and person-based identity (Sluss and Ashforth 2007). Followers' relational identification with their leader therefore is rooted in the follower identifying with the role relationship that they share with their leader, including, but not limited to, any of the constituent parts of the relational identity such as their and their leader's roles and the person-based identity the leader brings into his/her role. As an example, an electrician would identify with their role as an electrician, with their leader's role as a foreman, and with the manner in which their leader carries out their role (i.e., providing guidance, ensuring equipment is available, and maintaining a safe work environment). This diverges from personal identification in that with personal identification, the individual identifies with some or all of the identity characteristics of another individual; and role relational identification involves the individual identifying with the relationship they share with another. It also should be noted that regardless of proximity, any two individuals may form a role relationship, and furthermore the existence of the relationship only needs to be recognized by one relational member. This notion is supported by evidence that distant followers relationally identify with the role relationship they share with their leader even when the leader is unaware that a particular follower exists.

Role relationships and their corresponding identities only exist when each relationship member contributes to the relationship. This is easily recognizable in close leader/follower relationships with leaders regularly providing their follower with guidance, resources, and/or feedback. It is essential that the leader partakes in the relationship in a manner that makes the relationship meaningful to the follower and thus prompts follower identification. Leaders, who are not afforded the advantage of being in close proximity with their followers, may rely on discursive and/or policy-based gestures that bring the relationship into saliency as well as reflect that the follower's contributions are valued. Jack Walsh and Steve Jobs both recognized this need and attempted to spur relational identification among followers by annually meeting with all company employees and through scripted corporate presentations, respectively. Sending followers cards on their work anniversaries and implementing merit-based pay are additional tactics distant leaders may use to prime followers' relational levels of identity. Generating relational identification, as opposed to a collective/organizational identification, however, is dependent upon followers perceiving that it is the leader who is indeed involved in contributing to the relationship.

The needs for interdependence, to maintain the relationship, and to provide benefit for the other relational partner are the primary motivations behind one's relational identification (Brewer and Gardner 1996). The satisfaction of these needs leads the follower to become dependent upon their leader and more committed to their leader and therefore behave in a manner geared toward carrying out their leader's vision.

## Conclusion

Leadership exists because of followers and is measured through follower effectiveness within the organizational setting. This very notion serves as the essence of *identity leadership* – the shaping of the individual follower's identities in the workplace. Based on the premise that the leader/follower relationship can be rooted in a shared

collective, personal homogeneity, and/or a dyadic relational connection, three specific follower identities can emerge through the processes of unique identifications. These identities are each rooted in distinct needs which motivate a unique set of attitudes and behaviors. Leaders recognize the potential influence of these various follower identities in terms of their ability to inform attitudes and behaviors which may prove instrumental in organizational outcomes. This understanding, in turn, prompts leaders to engage in the management of these identities with the intent that the resulting influence will prove beneficial to the leader and the organization at large.

# Organizational Ihsan Behavior

Osama Hazzi
FrontiersToday, Vienna, Austria

## Synonyms

Discretionary behavior; Ethical behavior; Personal initiative; Voluntary behavior

## Definition

Organizational Ihsan behavior, as the current entry defines it, is a virtue-based discretionary behavior enhancing the welfare of organization and its members.

## Introduction

Like Judaism and Christianity, Islam shares similarities in terms of virtues promoting human welfare. "Lo! Allah enjoineth justice and kindness, and giving to kinsfolk, and forbiddeth lewdness and abomination and wickedness. He exhorteth you in order that ye may take heed." (Qur'an 16:90). Ihsan (where its meaning was translated to kindness) is a virtue Islam much considers.

The current entry translates this virtue into a conceptual multidimensional model of what one might call organizational Ihsan behavior (henceforth, OIB) and gives it meaning within the organizational context from the Islamic perspective. What is hoped here for is to present a model that Islamic and non-Islamic communities can apply. Islam is aimed at all the peoples and not only at Muslims (see Qur'an 21:107).

## Construct-Model

The current intended model used both the Qur'an as well as the Hadith (a saying, an action, a statement (including the tacit one), and an ethical or a physical character of the prophet Muhammad (peace be upon him)) to extrapolate the items.

Ihsan is an Arabic word (written إحسان) and broadly means kindness. In Islam, "*Iḥsān* is to worship Allāh as if you see Him, and if you do not achieve this state of devotion, then (you must consider that) Allāh is looking at you." (Sahîh Al-Bukhâri 1997c, vol 6, Book. 65, Hadith Number. 4777, pp. 260–261). The belief is that a believer doing good deeds wins in this life and the hereafter. "Whosoever doeth right, whether male or female, and is a believer, him verily we shall quicken with good life, and We shall pay them a recompense in proportion to the best of what they used to do." (Qur'an 16:97). It is not surprising to find those considering Ihsan behavior altruistically and conscientiously behave without expecting reciprocation from others. Table 1 shows OIBs with the source on which each item is extrapolated.

## Discussion

Within the context of the table, the current entry defines OIB as a virtue-based discretionary behavior enhancing the welfare of organization and its members. Concerning discretionary, OIB is a matter of personal choice. The belief is that such discretionary character is originally innate but learnable over the time (see Hazzi and Hamod 2019). The table shows that the OIB construct includes: (1) Organizational Ihsan Behavior Employee toward Employee (OIB-EE), (2) Organizational Ihsan Behavior Employee toward Organization (OIB-EO), and (3) Organizational Ihsan Behavior Organization toward Employee (OIB-OE). Whereas OIB-EE and OIB-EO, respectively, express the employee-practiced Ihsan-behavior benefiting their colleagues "possibly supervisor" and organization, OIB-OE expresses the authority-practiced Ihsan-behavior benefiting employees. Ideally, both OIB-EE and OIB-EO are evaluated by other-rating (supervisor/co-worker), while OIB-OE is evaluated by self-ratings (employees).

The sources on which items are extrapolated help one to well understand the OIB context. The current concern here is to highlight some items. The contractual tasks do not usually include Ihsan behaviors. In organizational settings, subordinates usually avoid telling their management or superior about mistakes the latter makes (e.g., unjust exercise of authority), as this may result unfavorable consequences; however, contributing to preventing management or superiors from oppressing subordinates "Advises his/her supervisor/management when latter makes mistake" could be a good example of the Ihsan behavior. It is worth mentioning that OIB-EO includes this item since a supervisor uses the authority the management gives to supervise a workflow, while OIB-EE includes the item "Assists his/her supervisor with work" since a supervisor is considered just like any employee and performs other tasks the management askes to do. Also, items such as "Assists his/her colleague even if both are quarreling" and "For organization's interest, reconciles between his/her colleagues quarreled" are great virtues worth highlighting. The good deed and the evil deed are not alike, and repelling the evil deed with one which is better can make those quarreled as though they were bosom colleagues. Reconciling between colleagues quarreled results much too. "For organization's interest, controls his/her reaction, forgives, and kindly behaves against his/her colleagues offending him/her" is a virtue similar to the two aforementioned and could show the extent to which one can characterized by Ihsan virtue. "Prefers his/her colleagues above himself/herself" is another high virtue and could show the extent to which one is altruistic. Last but not least, items such as "My Ihsan behavior drives supervisor/management to reciprocate" and "Supervisor kindly guides me when I make mistake" could show the extent to which the transformational leadership is. The transformational leaders inspire, energize, and intellectually stimulate their employees (Bass 1990). Employees working in organizations where this leadership is could go beyond task performance expectations and engage in Ihsan behaviors.

**Organizational Ihsan Behavior, Table 1** Multidimensional conceptual model of organizational Ihsan behavior

| Item – to what extent employee | The source on which item is extrapolated |
|---|---|
| **Organizational Ihsan Behavior Employee-Employee (OIB-EE)** | |
| 1. Helps new colleagues to overcome work challenges | (see Al Adab Al Mufrad 2015, Chap. 396, Hadith Number. 891, p. 573) |
| 2. Helps his/her colleagues to fix mistakes they make at work | (see Qur'an 5:2) |
| 3. Assists his/her colleague even if both are quarreling | (see Qur'an 41:34) |
| 4. Assists his/her supervisor with work | (see Jāmi' At-Tirmidhī 2007, vol 3, Main Chap. 15, Subchapter 3, Hadith Number. 1425, pp. 209–210) |
| 5. Accepts shift work instead of his/her colleague when asked to do so | (see Sahîh Al-Bukhâri 1997e, vol 9, Book. 89, Chap. 7, Hadith Number. 6951, p. 66) |
| 6. Prefers his/her colleagues above himself/herself | (see Qur'an 59:9) |
| **Organizational Ihsan Behavior Employee-Organization (OIB-EO)** | |
| 1. Advises his/her supervisor/management when latter makes mistake | (see Sahîh Al-Bukhâri 1997b, vol 3, Book 46, Chap. 4, Hadith Number. 2444, p. 362) |
| 2. Performs work with perfection | (see Qur'an 2:195) |
| 3. For organization's interest, initiates to fix his/her broken relationship with his/her colleague | (see Sahîh Al-Bukhâri 1997d, vol 8, Book. 78, Chap. 62, Hadith Number. 6076, p. 65) |
| 4. For organization's interest, reconciles between his/her colleagues quarreled | (see Al Adab Al Mufrad 2015, Chap. 183, Hadith Number. 391, pp. 291–292) |
| 5. For organization's interest, controls his/her reaction, forgives, and kindly behaves against his/her colleagues offending him/her | (see Qur'an 3:134) |
| 6. Preserves organization's resources even if this is not required | (see Sahîh Al-Bukhâri 1997e, vol 9, Book. 93, Chap. 1, Hadith Number. 7138, p. 160) |
| 7. Initiates to provide innovative suggestions to overcome problems organization faces | (see Qur'an 2:148) |
| 8. Favorably speaks about organization | (see Sahîh Al-Bukhâri 1997d, vol 8, Book. 78, Chap. 85, Hadith Number. 6138, p. 93) |
| **Item – to what extent** | **The source on which item is extrapolated** |
| **Organizational Ihsan Behavior Organization-Employee (OIB-OE)** | |
| 1. Supervisor reports my Ihsan behavior to management | (see Sunan Abu Dawud 2008, vol 5, Book. 40, Chap. 11, Hadith Number. 4811, pp. 274–275) |
| 2. Management recognizes my Ihsan behavior | (see Qur'an 11:85) |
| 3. My Ihsan behavior drives supervisor/management to reciprocate | (see Qur'an 55:60) |
| 4. Supervisor kindly guides me when I make mistake | (see Qur'an 17:53) |
| 5. Supervisor does not ask me to engage in unpaid tasks for being I engage in Ihsan behavior | (see Sahîh Al-Bukhâri 1997a, vol 1, Book. 2, Chap. 22, Hadith Number. 30, p. 70) |

Note: the author prepared this table

What is concluded from the table is that OIB-EE and OIB-EO could, respectively, measure the quality of the Ihsan behavior concerned to inter-employee relationships and the extent to which employees engage in Ihsan behaviors toward their organization; however, OIB-OE could measure the extent to which an organization engages in Ihsan behaviors toward their members. The discretionary character of OIB could foster the social and psychological environment in which task performance takes place, enhance synergistic relationships (both organization- and inter-employee relationships), and develop dyadic relationships between organization and other stakeholders. This machinery could help organization to harvest the fruit of this harmony.

## Concluding Thoughts

The centrality of the Ihsan virtue in the Islamic thinking lies in that this virtue should be present throughout all aspects of daily life. In the light of Muslim population changes, understanding how Islam considers Ihsan virtue is a good key for organizations to do business with Muslims and increase market share. Pew Research Center projects that by 2060 Muslims (3.0 billion, or 31% of the population) will near the Christians (3.1 billion, or 32%).

As with any new model, empirical research to research the reliability and validity of the OIB model and its potential antecedents and consequences could be worth pursuing. Such can help to further research and compare OIB with other discretionary organizational behaviors (e.g., organizational citizenship behaviors, OCBs) (see Hazzi 2018). Further collaborations from diverse cultures can help the research community to build virtue-loaded frameworks and better understand how each culture considers virtue-based discretionary behaviors at the workplace.

Research should not overlook that a right behavior in one culture may be wrong in other cultures. In Islam, "*Al-Birr* (righteousness) is a good character, and sin is that which wavers in your heart and you do not want the people to find out about it." (Sahîh Muslim 2007, vol 6, Book. 45, Chap. 5, Hadith Number. 6516, p. 423). Such can work for the organization and its members and help both to well alter their moral compass.

Islam is rich with virtues. The current entry provides some fresh new insights on the Islamic virtues and calls for further collaborations to develop a more sophisticated model. One should consider that human beings have benevolence (even if it is an atom's weight), and that should not overlook this. The need for such OIB has always been and will always be there. This helps one to have actual and constructive knowledge and reconsider the unfair stereotype the media raises about Islam.

## Good to Know

While the language of the Qur'an is Arabic, one cannot translate the Qur'an, and the existing translations are attempts to provide interpretations of the words existing in Arabic. Abdelaal and Rashid (2015) have provided an example showing that a set of factors (e.g., the semantic complexity of the vocabularies, mistranslations, and culture) can cause frequent partial and complete semantic loss of meanings when translating the Qur'an. The current entry used the Pickthall's translation.

The Hadiths employed in this entry characterize with a true degree of authenticity (Sahih). A Hadith science-specialized Muslim-scholar participated in a previous work entry (see Hazzi and Hamod 2019) validated the model, suggested and raised the item of "Advises his/her supervisor/management when latter makes mistake," provided the source on which this item is extrapolated, and defined Hadith. Generally, referring to Muslim scholars specialized helps one to avoid wrong employing of the Qur'anic verses and the Hadiths.

Last but not least, this entry tried to match between the current related accumulated knowledge it is aware of and the Qur'an and Hadiths it used to extrapolate the OIB model. In a word, the entry is subjective, and human beings generally are being exposed to make mistake.

## Organizational Inclusion in Arabian Public Contexts

Walid Chaouali[1] and Mohamed Mousa[2]
[1]International Institute for Higher Education in Morocco, Rabat, Morocco
[2]WSB University, Dabrowa Gornicza, Poland

### Synonyms

Social inclusion; Organizational inclusion

### Crisp Definitions of the Key Title Words

Social inclusion: is the “the trusted respectful relationships among society’s citizens” (Babacan 2005).

Organizational inclusion: is “the degree to which an employee perceives that he or she is an esteemed member of the work group through experiencing treatment that satisfies his or her needs of belongingness and uniqueness” (Shore et al. 2011, 1265).

### Introduction

The fact that Arab countries share a common heritage in religion (i.e., Islam) and language (i.e., Arabic) could create the misleading impression that the Arab region is a monolithic and homogeneous cultural system (i.e., there is no diversity in the Arab region) (Yahiaoui and Al Ariss 2017). Indeed, “Arab countries, a complex and diverse world, possess a multicultural diversity: ethnic, tribal, religious, linguistic, historical, traditional, and immigrational” (Yahiaoui and Al Ariss 2017, p. 250). Many factors such as the European and Ottoman invasions, the circulation of merchants and traders, the imbrication of families, and globalization have all fuelled this multicultural heritage (Yahiaoui and Al Ariss 2017). As far as religion is concerned, Islam includes some divergent Islamic rulings among its doctrines and

schools of jurisprudence that include the Sunnis, Shiites, and Ibadis (even clashes can exist between them) (Yahiaoui and Al Ariss 2017; Zaharna 2009). In addition to Muslims, there are other religious minorities. For example, Christians live in Egypt, Syria, Lebanon, Jordan, Iraq, and Palestine, and Arab Jews live in Morocco, Tunisia, Yemen, and Iraq (Yahiaoui and Al Ariss 2017; Zaharna 2009). With respect to ethnicity, non-Arab minorities also live in the Arab region with their own culture and language and include Armenians in Lebanon, Syria, Palestine, Egypt, and Iraq, Assyrians in Iraq and Syria, Kurds in Iraq and Syria, Berbers in North Africa, Afars and Nubians in northern Sudan and Egypt, Turks in Egypt, and Afars in Djibouti. Regarding language, other languages can co-exist with the Arabic language. In addition, many Arab countries have adopted a non-Arabic language as their co-official language such as Comorian and French in Comoros, French in Djibouti, Kurdish in Iraq, Berber in Morocco, Somali in Somalia, English in Sudan. In terms of gender, the Arab countries score higher than the world average on the UNDP's Gender Inequality Index making women the main victims of discrimination (Abadeer 2015). In addition, the Middle East and North Africa (MENA) region has the lowest score (61.1 %) of all regions in the Global Gender Gap Index (World Economic Forum 2020, p. 23). Concerning the situation of individuals with disabilities in Arab countries, disabled people suffer from discrimination, stigmatization, intolerance, mistreatment, and the "deprivation of their rights to equal opportunities in education, employment, and social inclusion" (Saad and Borowska-Beszta 2019, p. 30). Indeed, they score lower on literacy, educational attainment, and employment rates than people without disabilities (United Nations Economic and Social Commission for Western Asia 2018). In addition, the Arab region is home to a wider range of religions and ethnic groups due to the settlement of multinational companies and the influx of migrant workers (Yahiaoui and Al Ariss 2017). For example, Asian and African workers are subject to unfavorable working conditions more than the indigenous or Western expatriates, experiencing things such as "withdrawal of passports, abuse of women, prohibition of religious practice for non-Muslims, omission of salary payments" (Yahiaoui Al Ariss 2017, p. 254). Racial discrimination is still a taboo subject in the Arab region. For example, black Arabs in Tunisia endure racial prejudice and social exclusion (e.g., mixed marriages are a taboo subject in some regions in Tunisia) (Nawaat 2016). Moreover, incidents of racial discrimination were reported against black African refugees or illegal migrants regarding their inadequate living and working conditions in many Arab regions, such as Tunisia (Saunders 2011). More alarming still, Sub-Saharan Africans were targeted by Libyan rebel forces because of the color of their skin (United Nations High Commissioner for Refugees 2011).

## Organizational Inclusion in Egyptian Public Administration

In spite of the aforementioned backdrop, diversity among students in the Arab world is still in its infancy (Mousa 2021). More specifically, and in the context of occupational settings, little is known about the phenomenon of organizational inclusion. In this vein, employees prefer to work for organizations that recognize and appreciate the differences and uniqueness of people (Mousa 2021) and take an interest in and implement diversity policies to create an inclusive work environment with equity and equal opportunities for staff (Kundu and Mor 2017). However, we should distinguish between diversity and organizational inclusion (Mousa 2019, pp. 126–127). Diversity refers to, "the tangible and intangible differences among individuals, while organizational inclusion entails understanding and utilizing these individual differences for the betterment of individuals and their organizations" (Mousa 2021, p. 124).

In this chapter, we will focus on organizational inclusion in Egypt because it is an appropriate and interesting context to study organizational inclusion in the Arab world due to its rich cultural

diversity (ethnic and racial groups, the condition of Egyptian women, and the presence of various religious doctrines such as Islam and Coptic Christianity, among others), clashes and circumvention maneuvers that may occur between different groups. For example, Mousa (2017) found that in Egyptian public hospitals, Christian nurses favored treating and interacting with Christian counterparts and the same was true for Muslims (who favored treating and interacting with their Muslim counterparts). He also suggested that female employees hold fewer positions of responsibility than their male colleagues. In addition, Mousa and Ayoubi (2019) showed that male academics are unwilling to work under the leadership of their female peers in universities in Egypt. Based on Hofstede and Hofstede (2005), the four dimensions of the Egyptian culture are as follows:

- "Power distance, according to which leaders have and exercise unquestionable authority"
- "Uncertainty avoidance, according to which Egyptians tend to reject any change and constantly have fears about the unknown"
- "Individualism – family in Egyptian culture strongly shapes individual behavior"
- "Masculinity – men have a dominant role, and they are the main breadwinners in Egyptian society, while women are in charge of raising children" (Mousa 2020)

Mousa (2019) posits that achieving the goals and objectives of successful organizational inclusion requires vertical alignment with senior management and horizontal alignment with the participation of all departments (interdepartmental coordination and collaboration). Further, Mousa (2019) assumes that the level of organizational inclusion is determined by three types of community factors that are: (i) representativeness, which refers to "the extent to which the surrounding local community is fully represented or included within an organization's workforce, or in other words, the level of a demographic match between the organization's workforce and its surrounding community," (ii) status/power, which is defined as "the extent to which an organization's demographic composition and their treatment is influenced by the power of social identities such as race and gender in its surrounding society," and (iii) attitudes toward diversity, which refers to "the extent to which an organization's internal diversity/inclusion policies are influenced by the respect for diversity/cultural tolerance/sameness in the surrounding local community" (Mousa 2020a,b,c; Mousa and Alas, 2016 p. 128). Mousa (2019, pp. 131–132) demonstrates that organizational inclusion affects the relational psychological contract ("a reflection of the employee-employer relationship and revolves around positive management phenomena such as trust, organizational commitment, engagement, respect, and so on"), the transactional psychological contract ("a short-term work arrangement/mutual exchange characterized by limited employee organizational involvement and duties"), and the balanced psychological contract ("an open-ended work arrangement conditioned on the organization's economic success on the one side and the employee's economic (e.g., reasonable salary), career (e.g., training), and personal (e.g., flexible work hours) satisfaction"), through the mediating role of responsible leadership. Mousa (2019) therefore recommended the creation of an internal network of stakeholders (the school, the academic staff, and the community) to shape and maintain a high level of social integration inside and outside the school.

Mousa (2021) found that women faculty members (academic and administrative staff) face under-representation and demonstrated that gender predicted how people perceive organizational inclusion. Furthermore, he evidenced an association between diversity management, organizational inclusion, and workplace happiness. Mousa and Puhakka (2019) evidence a positive effect of responsible leadership and organizational inclusion on physicians' commitment (i.e., affective commitment, continuance commitment, and normative commitment) through the mediating effect of organizational inclusion. This can be explained by social exchange theory. The latter stipulates that "any investment in the employee/individual through support and encouragement stimulates positive responses in the employee (e.g. performance, loyalty, love, etc.)

towards his/her workplace and managers" (Mousa et al. 2021).

More importantly, Mousa et al. (2020a,b,c) investigated the reasons why organizations in the Arab world are resisting or failing to implement inclusion policies. The authors have explored some barriers to the implementation of organizational inclusion. Indeed, they identified several types of barriers that can be classified into three categories. These categories are: (i) cultural barriers (political ideology bias, religious bias, and gender bias), (ii) functional barriers (nepotism and lack of distributive justice), and (iii) psychological barriers (in-out group differentiation and dehumanization). In the context of higher education, they propose that universities can implement a fair system of financial rewards and grants and career promotion (e.g., supervising and publications of articles), create units to impartially manage international scholarships, increase the proportion of contractual staffing, and promote a culture of tolerance (e.g., training programs and courses) to enhance academics' feelings of inclusion (Mousa et al. 2020).

Mousa (2021) recommends that companies use quotas to equitably represent the different groups (e.g., on the basis of race, age, religion, and language among others) that constitute it. However, diversity management protocols can be seen as a threat by the members of the dominant group and, thus, lead them to nurture adverse feelings and behaviors against the members of the minority groups (Mousa 2021). Mousa et al. (2021) qualified organizational inclusion, therefore, as a double-edged concept. So, future studies can explore the dark side of organizational inclusion. Studying its negative aspects can provide insightful theoretical and practical implications.

## Conclusion

The Arab region is a cultural melting pot. It should be mentioned that conflicts and intolerance regarding race, gender, religion, and ethnic groups, among others, exist in the Arab region. These problems have become toxic in workplace settings. Therefore, given the scarcity of literature on the topic in the Arab world, we need to explore organizational inclusion in this context. This chapter tried to tackle organizational inclusion in Egyptian public administration. Furthermore, it presented some barriers to the successful implementation of organizational inclusion policies.

# Organizational Innovation

Mehmet Akif Demircioglu
School of Public and Environmental Affairs, Indiana University-Bloomington, Bloomington, IN, USA

## Synonyms

Advancement, or a change of an organization; Improvement; Newness; Novelty

## Definition

An idea, a new product, a new method, a new service, a new process, a new technology, or a new strategy adopted by an organization. The introduction of something new to an organization.

## Introduction

Innovation is one of the most buzzwords in today's society. Most people appraise innovation and consider that innovation is necessary for individuals and organizations. For instance, citizens demand that public sector should be more innovative, so the public sector can solve organizational and socioeconomic problems. However, do we know enough about innovation such as the sources and types of innovation? This paper focuses on innovation at the organizational level ("organizational innovation") and discusses why innovation is important and even necessary, followed by research on organizational innovation.

Many academic disciplines including sociology, psychology, social psychology, economics, anthropology, political science, information and communications technology, communication studies, health studies, and organization and management studies contribute the study of innovation (Greenhalgh et al. 2004). Organizational innovation can be defined as the introduction of

something new (an idea, product, service, technology, process, and strategy) to an organization. Lam (2006, 115) defines organizational innovation as "to the creation or adoption of an idea or behavior new to the organization." Likewise, Damanpour (1991, 556) defines innovation as "adoption of an internally generated or purchased device, system, policy, program, process, product, or service that is new to the adopting organization." Although the aim for innovations is making something better, not all innovations are successful.

Innovation is different from invention because the latter refers to something entirely new product, service, technology, or process (e.g., patents). Innovation, on the other hand, can be small adoptions or changes. In addition, while reforms are typically at the national level, organizational innovations are mostly at the organizational level. On the other hand, innovation at the individual level mostly refers to an employee's creativity or her or his innovative behavior. Finally, organizational change may not necessarily involve innovations as many organizations change their structure or strategy without being innovative. While innovation is typically a small adaption, organizational changes refer to larger-scale changes particularly related to changing organizational structure and design.

## Why Innovation?

Because organizational environments frequently change, organizations need to be innovative to survive and prosper. Damanpour (1991, 556) argues that innovation can "contribute to the performance or effectiveness of the adopting organization. Innovation is a means of changing an organization, whether as a response to changes in its internal or external environment or as a preemptive action taken to influence an environment." Via innovations, organizations can fit the environment, so they can survive and prosper. For instance, if today's organizational environment emphasizes empowerment and democratization of workforce, organizations will need innovative practices emphasizing democratic innovations, so organizations can prosper. This is particularly true for public organizations as the measurement of success in public organizations is typically not based on profit. Public organizations need to be legitimate in order to survive and prosper. Innovation at the public sector can also increase citizens' trust to government.

Analyzing organizational innovation from the institutional theory perspective is very relevant particularly to the public sector. DiMaggio and Powell (1983, 147) argue that "change in organizations seems less and less driven by competition or by the need for efficiency... [innovation and change] occur as the result of processes that make organizations more similar without necessarily making them more efficient." Organizations, particularly public organizations, adopt innovations to increase legitimacy because governments, other public agencies, civil society, citizens and citizen groups, and professional organizations suggest, advocate, or require them. Likewise, many public organizations do not aim to make profits with their activities. As long as these organizations are considered legitimate by government, stakeholders, and citizens, these organizations can survive and prosper (e.g., receive higher budget, increase their staff, and can be praised by media). In this regard, many organizations innovate to increase their legitimacy. The following section will discuss research on organizational innovation.

## Research on Organizational Innovation

One of the leading papers on organizational innovation, Lam (2006) has stated that studies of organizational innovation can be classified into three different ways which lead to three different research questions: (1) organizational structure and design theories (e.g., contingency and industrial economics theories), (2) organizational cognitive and learning theories, and (3) organizational change and adaptation theories (e.g., incremental vs. evolutionary view of organizational change and punctuated equilibrium theories).

First, organizational structure and design theories which the level of analysis is at the organizational focus on how structural elements of organizations affect propensity of organizations to innovate. Second, organizational cognitive and learning theories which the level of analysis is micro focus on the cognitive foundations and knowledge creation of organizational innovation (e.g., innovations for problem solving). Third, organizational change and adoption theories which the level of analyses are organizational and external environment focus on how organizations adapt (or not able to adapt) environmental shifts and technological changes (Lam 2006, 116–136). In addition to these three ways of studying organizational innovation, we can systematically approach studies of innovation as the following categories: (1) innovation as a dependent variable, (2) innovation as an independent variable, (3) sources of innovation, (4) types of innovation, (5) innovation climate, and (6) measurement of innovation.

## Innovation as a Dependent Variable (Or Factors Effecting Innovation)

Because innovation is such an important concept (e.g., innovation affect survival and performance), analyzing factors affecting innovations is crucial topic. Many studies examine which factors affect innovation in organizations. Greenhalgh et al.'s (2004) meta-analysis of service and manufacturing organizations shows that while administrative intensity, complexity, external communication, internal communication, functional differentiation, managerial attitude toward change, professionalism, slack resources, specialization, and technical capacity have positive effects to organizational innovation, centralization has a negative effect to organizational innovation. On the other hand, formalization, managerial tenure, and vertical differentiation have no statistically significant effect to organizational innovation. Future research continues analyzing the effects of these or different factors (e.g., location of the work and type of organizations) on innovation.

## Innovation as an Independent Variable (Or Outputs/Outcomes of Innovation)

Countless studies exist analyzing the outputs and outcomes of innovation. As mentioned in the introduction section, innovation at organizations can increase organizations' chance for survival and increase prosperity, competition, legitimacy, and trust to organizations. In addition, innovation can increase organizational productivity, efficiency, performance, and customer satisfaction, competition, and quality of services. Innovation can also reduce the costs of the products and services. Future research continues searching outcomes of innovation in different organizational settings such as the effects of organizational innovation on employees' organizational commitment, job satisfaction, turnover intention, and organizational citizenship behavior. In sum, innovation can affect cost, organizational process, quality of products and services, and citizens' satisfaction.

## Sources of Innovation

Who are the sources/actors that contribute to innovation is not a trivial question. On the contrary, this question is crucial because innovation exists only if ideas come from certain sources or different actors contribute to innovation. Innovation particularly in public sector may come from employees' workgroup, organizational leaders, the government, other public agencies (e.g., regulatory agencies), industry stakeholders, universities, and members of public. Thus, sources of innovation can be a top-down (e.g., ideas coming from the organizational leaders and government), bottom-up (e.g., ideas coming from the employees' workgroup), or external (e.g., ideas coming from the universities and the industry stakeholders). Future research may contribute the sources of innovation literature via analyzing how each individual sources affect organizational outcomes (e.g., organizational performance), individual outcomes (e.g., employees' job satisfaction or their innovative behavior), and types of innovations (Demircioglu et al. 2016).

## Types of Innovations

Types of innovation include but not limited to product (including goods and services), process, marketing, and organizational innovation. Damanpour (1991, 556) states that "An innovation can be a new product or service, a new production process technology, a new structure or administrative system, or a new plan or program." These factors are also dimensions of innovation. Single innovations refer to small adoptions affecting one dimension of the innovation. On the other hand, complex innovation refers to the dimensions of innovation, namely, product, process, etc., which are affected by the single innovation. The more dimensions are affected by a single innovation, the more complex the innovation is. In other words, if several dimensions are affected by a single innovation, the innovation becomes complex. Today, socioeconomic problems and governments' expectations from government increase and more actors are involved in the innovation process. In fact, "The relationship between organization and innovation is complex, dynamic, and multilevel" (Lam 2006, 138). Thus, it is better to adopt complex innovation as complex innovations can solve complex problems (Demircioglu 2016a). In addition, types of innovations can be administrative vs. technical, product vs. process, and incremental vs. radical (Damanpour 1991). Future studies continue examining the complexity of innovation and types of innovations.

## Innovation Climate

Klein and Sorra (1996, 1060) define innovation climate as "to targeted employees' shared summary perceptions of the extent to which their use of a specific innovation is rewarded, supported, and expected within their organization. . . [Innovation climate is] the result of employees' shared experiences and observations of, and their information and discussions about, their organization's implementation policies and practices." Innovation climate is measurable both qualitatively and quantitatively and gives information about the process of innovation as well as the individual and organizational context of innovations. For instance, if an employee's workplace encourages innovation, if managers support employees when employees suggest new ideas, and if established processes for evaluating employees' innovative ideas exist, innovation climate for this organization will be higher. Innovation climate not only leads innovations, but it can also reduce employees' turnover, increase their job satisfaction, and increase their organizational commitment (Demircioglu 2016b). Additionally, innovation climate can increase both organizational and individual performance. In this regard, organizations and organizational leaders should establish a positive innovation climate.

## Measurement of Innovation

Both qualitative studies and quantitative studies can measure innovation, or innovation activities. For instance, via conducting semi-structured interviews and focusing on a few cases, researchers may measure innovation via analyzing "how" and "why" questions such as why certain agencies are more innovative than others. In terms of quantitative studies, many surveys aim at measuring innovation and innovation activities. These types of surveys are more common in Europe. For instance, OECD's Oslo Manuals, Community Innovation Surveys (CIS), Policies, Appropriation, and Competitiveness in Europe (PACE) survey, the Maastricht Economic and Social Research Institute on Innovation and Technology (MERIT), *Service des Statistiques Industrielles* [Statistical Service of the French Ministry of Industry] [SESSI] are such examples in Europe (Demircioglu et al. 2016). Unfortunately, these kinds of surveys are very limited in the United States; one exception is 2014 National Survey of Business Competitiveness (NSBC) conducted by the United States Department of Agriculture which aims to measure innovative activities in private firms in the United States (Demircioglu et al. 2016). These surveys typically measure innovation in private organizations. Regarding public sector innovation, the Federal

Employee Viewpoint Surveys (FEVS) in the United States ask only a few questions on innovation measuring employees' innovative behavior. The Australian Public Service Commission's (APSC) the State of Service surveys or census, however, provides more questions on innovations measuring barriers to innovation, adoption of innovation, innovative behavior, innovation complexity, outcomes of innovation, and innovation climate. Thus, future research may continue investigating innovation with using qualitative studies and these surveys, particularly with CIS and APSC datasets.

## Conclusion

Overall, what we know on organizational innovation is very limited. Many innovations innovate to increase their chances of survival and prosperity. Additionally, organizations, particularly public agencies, innovate to increase their legitimacy. This paper analyzed studies on organizational innovation into the following categories: innovation as a dependent variable, innovation as an independent variable, sources of innovation, types of innovation, innovation climate, and the measurement of innovation. Each of these categories will lead different research questions. Although organizational innovation mainly concerns innovation at the organizational level, to adopt innovations, a positive innovation climate and sources affecting innovation are necessary. Additionally, innovation in organizations particularly in the public sector aims at reducing cost and increasing quality of products and services. Organizations may prefer to implement complex innovations because today's problems are becoming more complex. Last but not the least, researchers need to analyze and develop measurements for innovation and innovation activities.

# Organizational Institutionalism

Margaret F. Reid[1] and Song Yang[2]

[1]Department of Political Science, University of Arkansas, Fayetteville, AR, USA

[2]Department of Sociology and Criminal Justice, University of Arkansas, Fayetteville, AR, USA

## Synonyms

Diffusion; Institutional logics; Institutional work; Isomorphism; Organizational fields

## Definition

Organizational institutionalism refers to a broad field within institutional scholarship that seeks to understand how organizations and institutions interact to conform to legitimate rules or the extent to which organizations effect changes within these institutional arrangements

## Introduction

The field of organizational institutionalism has become highly dynamic and begins to show similar strains encountered in other fields of organizational and institutional studies as they mature and expand beyond their initial theoretical suppositions (Greenwood et al. 2008). Organizational institutionalism refers to a broad field within institutional scholarship that seeks to understand how organizations and institutions interact to conform to legitimate rules and the extent to which organizations effect changes within these institutional arrangements, in other words, how organizations adapt to internal and external pressures for change (e.g., Seo and Creed 2002). Still emerging are newer bodies of studies on comparative organizational institutionalism (Djelic and Quack 2003; Whetten et al. 2009) and applications to emerging political economies (Drori 2008).

Initially conceived by social theorists such as Durkheim, Marx, and Weber, organizational institutionalism quickly was situated within the context of broader institutional level studies that includes Selznick's groundbreaking analysis (1949) of the Tennessee Valley Authority which explicitly recognized the impact of the organization's environment on its operations and goals. This line of reasoning became one of the dominant theoretical strands in the literature (see also Pfeffer and Salancik 1978) and triggered a multi-decade debate on how institutional practices are formed, maintained, and transformed. One of the interesting contributions to the field was Berger and Luckman's post-positivist treatise *The Social Construction of Reality* (1966) which remained largely anchored in the context of macro-institutional exchanges, e.g., between states and markets. It failed, however, as many other institutional theories do, to account for agency and power as triggers of change, critical elements in dealing with institutional complexity. DiMaggio's work (1988) further directed attention to the need to incorporate interest and agency into institutional theory. He and others asserted (DiMaggio and Powell 1991) that agency represents a source of power to change institutions and not just being shaped by them. These changes often occur at the organizational level, especially when organizations interact to achieve desired outcomes. New practices that may result, and, if sufficiently diffused, can lead to wider changes in the institutional domain. It is now abundantly clear that the predictions of older institutional theories (Di Maggio and Powell 1983) of the increasing isomorphism of organizational forms had been vastly overstated. The channels through which isomorphism occurs are often heavily dependent on the acceptance of the institutional environment in which organizations operate (Purdy and Gray 2009). When institutional environments are heterogeneous, it is not clear at which level of analysis these complex problems are to be tackled – should we migrate the analyses away from organizations to interorganizational levels of analysis, for example, or must we pay greater attention to individual agency at lower levels. Moreover it is not clear what processes and mechanisms produce the "migrations." The institutional literature is increasingly divided over answers to these questions.

This raises two additional points: institutional domains (and organizations populating them) exist both in temporal and spatial contexts that must be accounted for. There currently is little focus on these questions given their complexity and they may need other research approaches that are not currently part of mainstream institutional work.

The next segment will review the discussions of organizational institutionalism with regard to select topics: isomorphism and diffusion, institutional logics in the context of legitimacy, power, and institutional agency, and institutional complexity which refers to a phenomenon where organizations operate in multiple or heterogeneous institutional spheres (typical example: public-private collaborations).

The subsequent segment will explore these questions in the context of the fields of public administration and public policy, academic fields that have contributed relatively little to the advancement of these broader institutional debates. The final segment will address challenges we face when we move these discussions to transnational contexts.

## Emerging Perspectives on Organizational Institutionalism

### Isomorphism, Diffusion, and Organizational Change

Organizational institutionalism emerged from attempts to explain relationships between actors (individuals or organizations) and their environments (social, cultural, economic, or political) to determine the degree to which institutions constrain actors' behaviors (DiMaggio and Powell 1983; Scott 2001). DiMaggio and Powell contended that pressures on organizations to conform to specific forms would lead to increasingly similar organizational forms in certain institutional domains. According to these authors, responses to pressures stemming from an organization's environment can take three forms: mimetic, coercive, and normative. When conditions are uncertain, organizations take to imitation of peers to reduce possible adverse consequences of being perceived "different" (Haveman 1993). Coercive pressures often originate from powerful actors well entrenched in their institutional domain (such as governments or dominant organizations) that also control resources that less powerful actors need (Scott 1995/2001). In the abstract, as Tolbert and Zucker (1983) have argued, coercive pressures tend to accelerate adoption of similar structures and processes, but we know that, for example, state regulations are not adopted uniformly and that discretion accorded to the implementers give them a relatively wide berth during the decision-making process. As a result, as these organizational actors experiment with various approaches, new practices may form based on the meanings these actors attribute to their work (e.g., Townley 2002) Finally, normative pressures arise when values are contested or courses of action are unsure and organizations struggle to find common ground. The discussions around corporate social responsibility would be an example of this contestation. As with all isomorphic processes, the question that remains prominent is to what extent are responses to these pressures accepted or resisted and to what extent can processes and structures diffuse sufficiently across organizational fields and institutional domains to support claims of isomorphism. Thus, emphasis should be placed on studying the mechanisms, motivations, and social constructions that occur at the early stages of organizational interactions and organizational actors involved with them (Seo and Creed 2002).

In a similar vein, Oliver (1991) noted that organizations are not passive players but attempt to develop responses that align with their own missions and purposes. Often, as Galaskiewicz (1985) has argued, professions play an important role in determining what practices or norms should be adopted by organizations who then serve as conduits for the larger institutional environment. It is quite clear from these brief discussions that the traditional assumptions that institutions are rather fixed and that organizations conform to expectations are what Meyer and Rowan (1977, p. 343) refer to as "rationalized myths." They obscure the highly dynamic interactions that occur between individual actors, organizations (note the abundant literature on institutional entrepreneurship), and the increasing differentiation of institutional layers that pose significant challenges to claims of isomorphism and mechanisms to explain the survival of organizational and institutional forms.

### Institutional Logics

Alford and Friedland (1985) in their seminal work contend that these challenges have pushed institutional theory to reconsider the power of isomorphism. In their 1991 work Friedland and Alford contend that each institutional sphere produces its own logics that both constrains action and provides sources for change. Thornton and Ocasio

(1999, p. 804), building on the work by these and other authors, define institutional logics as "the socially constructed, historical patterns of material practices, assumptions, values, beliefs and rules . . ." that create the links between individuals, organizational practices, and the institutional spheres in which they operate. In other words, prevailing institutional logics provide constraining forces while also being subject, over time, to individual and organizational actions that may create change. In addition, societies must also be seen as inter-institutional systems (Friedland and Alford 1991) with each institutional domain possessing its own interpretations of key constructs such as equity, efficiency, competition, and other core values that inform the actions and principles of the individual and organizational actors in this domain. Unfortunately, most research tends to focus on one level over the other and thus tends to miss the cross-level effects that are the foundations for change. When power is added to the equation, conflicts and contradictions between institutions further highlight the importance of organizational and individual agency as transformative forces in institutional logics. Mohr and Guerra-Pearson's (2010) offer an interesting example of clashing institutional logics in their study of New York welfare agencies. The study examined organizational actors' divergent classifications of "the poor" by various relief agencies. Ultimately one group of social welfare organizations succeeded in imprinting its definition of "person in need" on the social welfare field and it has since become the basis of how we classify these individuals.

Organizational institutionalism thus focuses attention to the micro-level analysis of institutional persistence but also to resistance and change especially when confronted with competing institutional logics. However, interests and ideas (Howarth 2013; Eleveld 2016) have played a limited role in the discussions of perpetuation or change of institutions as practices and beliefs are seen as institutionalized (e.g., Davis et al. 1994). Social movement theories are a useful complement to organizational institutionalism as both are trying to explain change (social or organizational) and diffusion of practices that are seen as legitimate to the participants in their respective institutional domains (see, e.g., Davis and Zald 2005). For public policy and public administration scholars, social movement theories are especially useful as they consider the political conditions for diffusion of alternative ways of approaching institution building and explaining process of institutionalization and deinstitutionalization (Rao et al. 2000; Oliver 1992; Edelman et al. 2011).

Critical assumptions on how organizations resolve potential conflicts between externally imposed demands to retain legitimacy in their broader institutional domain in which they operate (e.g., health care) are sometimes challenged by the internal demands represented by organizational members and their often diverse professions. As the capacities of these professions have increased (e.g., through university-based education, licensing, or the professionalization of trades and occupations), legitimacy is not only bestowed on the broader institutions to which these actors are tied but through the actors, or networks of actors, themselves using vehicles such as accreditation by bodies outside their "home" institutions. This may explain the findings by Sherer and Lee (2002) who observed that a high degree of legitimacy, often through the actors who populate them, has allowed organizations to deviate from institutionalized practices in their respective institutional domains. A couple of examples serve as illustrations. Even though society is widely divided over LGBT acceptance as a matter of public policy, many corporations adopted gay-friendly policies fairly quickly and without much fanfare (see, e.g., Scully and Creed 2005). Informal networks of gay activists, many strategically well placed in their organizations, forcefully advocated for the adoption of domestic partner benefits. Another example is Tolbert and Zucker's (1983) account of the diffusion of municipal reforms in American cities noting how stable institutional practices were quickly changed by the rapid adoption of these reforms. The perceived legitimacy of these and other professional networks advocating for change is central to organizational institutionalism: who or what confers legitimacy and to what degree does it lead to stability in an institutional domain and the speed with which new practices become institutionalized.

### Institutional Complexity: The Role of Organizational Fields

The increase in inter-institutional relationships requires that we take a new look at the formation of organizational fields "a community of organizations that partakes of a common meaning system and whose participants interact more frequently. . .than actors outside the field" (Scott 1995, p. 56). In other words, organizational fields constitute relational spaces that bring together organizational actors often with varied institutional logics. As these actors become aware of overlapping or competing motivations, they may decide that their future interactions are beneficial for all participants. What causes an organization to engage within a field and not another is not well understood. Environmental conditions not favorable to the organization may force it to become involved with the field for its own protection, but may evolve over time to a recognition that field membership is beneficial and assists with enhancing organizational interests. Thus understanding field-level engagements are vital to capturing the degree to which institutional influences are accepted, rejected, or transformed through these relationships. Zeitz et al. (1999), for example, urge that close attention be paid to these relational dynamics which promote the adoption of particular practices, but also urge to observe these processes over time so a better understanding is gained how change may occur.

Such insights are especially relevant for public policy and public administration, where power and legitimacy play a central role, but academic fields that have not always fully engaged with this literature as will be discussed in the next section.

## Organizational Institutionalism: Where Is Public Administration and Policy Research?

The surprising lack of applications of the neo-institutional literature in public sector journals has deprived this field of making significant scholarly contributions to the advancement of institutional research which is largely dominated by organizational and sociological studies as well as management scholarship (Hall and Taylor 1996). Yet, the recent reform efforts around improving and economizing public service delivery, network analysis, or policy diffusion would seem like excellent jumping-off points for incorporating discussions of organizational institutionalism. To address the increasing heterogeneity that has occurred in the various institutional domains that are populated by hybrid state-market arrangements, as Elinor Ostrom discussed in her Nobel prize lecture (2009), it is important our theorizing includes multiple levels of analysis. For the public policy and public administration fields, several questions are central in this endeavor: how to understand inter-institutional boundary conflicts during policy design and implementation, how to explain organizational adaptations to conflict and power sharing in organizational fields (e.g., health care; education), and how to better gain an understanding of the effects of changing social norms and values that influence how individuals and their professional associations use sense making (Weick et al. 2005) in promoting or resisting reform efforts (Kelman 2005).

While all levels of analysis require more intentional theorizing, in the context of this chapter "Organizational Institutionalism", the focus will be on what Lawrence and Suddaby have referred to as "institutional work" (Lawrence et al. 2009, 2011), a newer strand of the literature that has not found widespread attention in the public affairs field (see, e.g., Cloutier et al. 2016). The authors defined it as "the purposive action of individuals and organizations aimed at creating, maintaining and disrupting institutions" (Lawrence and Suddaby 2006, p. 215). It continues earlier discussions of the discretion exercised by "street level" professionals (Lipsky 1980) as vital to the implementation of policies. Unfortunately, Lipsky's work has remained undertheorized because the predominant focus has been on the organizational and institutional levels. Lawrence et al. (2009, p. 12) argue that institutional work occurs at the cross-section of the necessary maintenance of institutional rules and the potential for disruptions that exist when individuals work within the rules, beliefs, and practices that their institutions and organizations impose on them.

Seo and Creed (2002, p. 223) refer to this paradox of institutional determinism and agency as the "paradox of embedded agency." It requires an acknowledgement of "nestedness," i.e., individuals' embeddedness in their organizations, as well as their organizational fields, which all impose varying degrees of constraints on their actions that organizational managers must reconcile or attempt to reject. To illustrate, a couple of examples from the recent literature will be used. Cloutier et al.'s (2016) study of the transformation of Quebec's publicly funded health-care system is especially helpful. It explicitly references some of the insights gained from Lawrence and Suddaby's research on institutional work to "to understand how managers responsible for newly formed health-care organizations defined and carried out their individual missions while simultaneously clarifying and operationalizing the government's reform mandate" (Cloutier et al. 2016, p. 259). Like the subsequent example, the reforms in Quebec were designed to create greater efficiencies but also improve client services. The provincial government attempted to achieve a fundamental shift in thinking about health-care delivery or what the authors call an "interpretive shift" (Cloutier et al. 2016, p. 262). The changes were both structural and conceptual, intended to address health-care delivery in a more holistic fashion (population health). Like any institutional work, the major challenge of effecting change is to translate fairly abstract change ideas into workable everyday solutions for the implementers. In this case, as in the next case, frequent communications about the changes were critical to working through "entrenched power relationships as well as values and interests structured by older institutionalized rules" (Cloutier et al. 2016, p. 268). The outcomes as in most of these cases involve negotiated resolutions between managers and frontline operatives that inevitably produce a dilution of the initial change philosophies but also more realistic chances of resolving conflicts.

The second example is Kelman's (2005) well-designed account of organizational change in a US federal procurement agency. Its fit with the current discussion is apparent. The agency was tasked during the "reinventing government" era of the 1990s with streamlining and refocusing its mission to become more client-centered and efficient in its operation. The intersectoral aspects of this case are especially noteworthy as it exemplifies the need to reconcile the institutional logics of both market and state organizations. Organizational actors in both institutional domains try to ensure the maintenance of organizational values as well as respond to institutional pressures imposed from outside their organizations. Kelman's account clearly chronicles the attempts of a core group of agency managers to break with established organizational logics to effect the changes. It demonstrates the importance of human agency (in this case senior managers and their mid-level management supporters) when creating enabling conditions for agency employees to engage in institutional work to renegotiate organizational practices. Kelman was deliberate in considering individual agency as the unit of analysis, even though the broader focus was on organizational change (Kelman 2005, p. 233).

What these examples demonstrate is the need to pay attention to both temporal and contextual dimensions of organizational change. Given the complexity of organizational work and the myriad of internal and external factors impacting organizational outcomes, it is not surprising that many of the extant studies are case analyses. Ruef and Scott's work (1998) as well as the example of changes in Quebec's health-care system are important reminders of the temporal dimensions of institutional change. Not only do organizational fields (e.g., health care) respond differentially to these challenges, the tensions that arise between inter-institutional actors highlight the importance of a multi-method approach in analyzing these phenomena (e.g., Mohr and Duquenne 1997).

## Organizational Institutionalism Meets Transnationalism

Traditional institutional theory assumed increasing conformity and similarity as dominant organizational forms spread throughout a country and eventually globally. Yet, the increasing

complexity of institutional environments, as has been shown earlier in this entry, suggests that competing and conflicting organizational logics are important sources of change (Friedland and Alford 1991). These conflicts then produce important discourses over the meaning of an institution or an organizational field, as actors vie for power and influence to determine the outcomes of these conflicts (Clemens and Cook 1999).

Hannerz (1996, p. 6) proposed the use of the term "transnational" when we try to describe the institutional blurring that is occurring globally. It captures, unlike the term "global," the institutional foundations that are of interest here: the intersection of organizations, individuals, and norms spanning the boundaries of nation-states all the way down to local communities. It does not suggest a homogenization or submerging of national and local identities. What it does suggest is that the extant multiple layers of transnational economic, political, and social activities may vest power in newer forms of actorhood (such as transnational or nongovernmental organizations or social movements). As these organizations often function in overlapping institutional realms, they are challenged to address societal problems that single institutions are not able to recognize or to address (Ocasio and Joseph 2005; Thornton et al. 2012).

International political transformations in central and eastern Europe or China, the rising importance of transnational political or economic organizations, force institutional theory to provide explanations of institutionalization or deinstitutionalization at both macro- and micro-levels of analysis. As Djelic and Quack (2007) have pointed out, that as organizations receive signals from other organizations in their organizational field that impending changes may need to be addressed. Organizational actors are then forced to decide to what extent they wish to respond to external international pressures for change and assess the political or economic costs that such changes may bring to their organizations and their organizational networks. However, the current literature has not yet developed appropriate approaches to systematically connect all institutional layers, from transnational to the local levels, when we examine the dynamics of institutional change. Organizational studies are especially useful in this discussion because many of these incipient developments tend to occur there first. Organizations are also the vehicle that ultimately reconciles how changing or conflicting logics are to be institutionalized. Djelic and Quack's (2007) case study of the emergence of international accounting standards provides an interesting example of how transnational, national, professional, and organizational players responded to calls for changes in their national accounting rules in favor of greater international uniformity in these rules. While "power and policy feedback were needed to generate momentum" (p. 181), it was ultimately the role of individual and organizational actors to nudge others toward their adoption. It illustrated how "transitional rule-making had feedback effects on national institutional trajectories" (182) to explain the extent to which resistance and change occurred at the national and subnational levels.

## Conclusion

This entry's intent was to highlight some of the emerging trends as well as remaining gaps in the literature on organizational institutionalism. More than anything, these debates reflect the larger, ongoing discourses in the social sciences that have unfortunately balkanized the social science disciplines for a while. As institutional theory expands into the inter-institutional and especially transnational realms, it becomes inevitable that researchers pay attention to the tremendous variations that have occurred. For methodologists who insist on parsimony and generalizability, this presents dilemmas. Micro-level actors, individuals, and organizations are ultimately responsible for assigning meaning to their organizational processes, formulating conventions that guide decisions, or serving as platforms for negotiations, collaborations, or conflicts which may ultimately reshape the organizational logics that inform the institutional domain(s) to which they belong. Thus the ability to generalize from one national or organizational field context to another remains limited.

# Organizational Justice

Juliana D. Lilly
Sam Houston State University, Huntsville, TX, USA

## Synonyms

Distributive justice; Informational justice; Interactional justice; Interpersonal justice; Organizational fairness; Procedural justice; Workplace fairness; Workplace justice

## Definition

Organizational justice refers to people's perceptions of fairness in organizations, particularly in the workplace. Four distinct dimensions, or types, of organizational justice have been identified (distributive, procedural, interactional, and informational), but researchers have also focused on a fifth dimension referred to as overall justice.

- Distributive justice refers to the fairness of decision outcomes such as the allocation of pay raises or other resources in an organization.
- Procedural justice refers to the fairness of decision-making procedures leading to a decision outcome.
- Interactional justice refers to the fairness of interpersonal treatment during the decision-making process such as treating those involved with dignity and respect throughout the decision process.
- Informational justice refers to the perceived fairness of explanations provided to people about why procedures were used or why outcomes were distributed in a certain way.
- Overall justice refers to a global perception of fairness that draws information from elements of the other four dimensions.

## Introduction

Concern for justice and fairness has been important to people in all cultures for thousands of years. All major world religions advocate fairness in dealing with others, and Western philosophers such as Socrates and Plato incorporated the theme of justice in their writings on virtue and ethics. Modern organizational justice interest began after World War II with the concept of relative deprivation. Relative deprivation occurs when an individual feels deprived of things they are entitled to because others around them have more (Stouffer

et al. 1949). Thus, people compare what they have versus what others around them have. When they perceive that they have less than the comparison other, they conclude they are deprived, or disadvantaged, relative to the other person. The idea of relative deprivation led to the concept of distributive justice.

## Dimensions of Organizational Justice

*Distributive justice*. Researchers studying relative deprivation began to formulate theories to help explain why feelings of relative deprivation occur. Social exchange theory (Blau 1964; Homans 1958) states that individuals develop exchange relationships with others that are governed by rules. One such exchange rule is the norm of reciprocity, the idea that if person A helps person B, then person B should reciprocate by helping person A in return. From these social exchanges, individuals make comparisons between their investment in and profit from the exchange and another person's investment in and profit from the exchange. If the comparison is perceived as unequal, individuals perceive the situation as unfair. Equity theory (Adams 1963, 1965) argues that unequal comparisons result in anger for the person who perceives fewer outcomes than the comparison other and result in guilt for the person who perceives more outcomes than the comparison other.

Social exchange theory and equity theory serve as the theoretical basis of many distributive justice studies, but the outcomes examined in early research focused primarily on economic outcomes such as work compensation and equity as an allocation norm. Equity means the outcomes are allocated to each according to his/her inputs, so those who produce more receive more and those who produce less receive less. While most organizational justice research in the 1960s and 1970s focused on distributive justice, or the fairness of decision outcomes, some researchers also touched on the importance of procedures used in making the decision.

In fact, researchers in the 1970s suggested that noneconomic outcomes and other allocation norms such as equality and need were also important to individuals in deciding if a particular situation is fair or unfair (Deutsch 1975; Leventhal 1976). Equality means the outcomes are distributed equally to all regardless of productivity while need means the outcomes are distributed based on need regardless of productivity. Thus, the process by which outcomes are distributed influence perceptions of fairness, and the concept of procedural justice began to develop.

*Procedural justice*. A seminal work on procedural justice examined perceptions of fairness in legal procedures. Thibaut and Walker (1975) contrasted the adversarial system of justice used in the USA with the inquisitorial system of justice used in continental Europe. In the adversarial system, the prosecutor and defense present evidence while the judge remains neutral, weighs the arguments, and decides the outcome. In the inquisitorial system, the judge is not neutral; the judge presents evidence, questions the witnesses, and decides the outcome. In controlled studies, Thibaut and Walker found that people were more satisfied with the procedure in the adversarial system than with the inquisitorial system. As a result of this research, Thibaut and Walker (1978) introduced two concepts, decision control and process control. Decision control, similar to distributive justice, is the extent to which an individual can determine the outcome of a dispute. Process control is the extent to which an individual can control the procedures used to determine the outcome of a dispute.

Studies examining the issue of procedures in the context of disputes supported the idea that process control could influence attitudes in decision-making situations, and the concept of procedural justice as a separate construct began to emerge in the literature. Early work on procedural justice identified specific rules for fair procedures, and subsequent studies used these rules to develop measurement scales for procedural justice. These rules include:

1. Consistency – procedures should be consistent across time and persons.
2. Bias suppression – procedures should be unbiased.

3. Accuracy – procedures should be accurate and lead to valid decision outcomes.
4. Correctability – procedures should allow participants to appeal decisions.
5. Representativeness – procedures should reflect the basic values and concerns of participants.
6. Ethicality – procedures should be consistent with fundamental moral and ethical values (Leventhal 1980).

Much of the early research on procedural justice focused on demonstrating the difference between distributive justice and procedural justice with many researchers including both constructs within the same study to test the differential effects of each type of justice on outcome variables such as pay satisfaction, turnover intentions, or commitment (Colquitt et al. 2005). Several researchers discovered a statistical interaction between procedural justice and distributive justice, a finding known as the "fair process effect" or the idea that fair procedures tend to reduce negative reactions to unfavorable decision outcomes. A review article devoted to examining the interaction between procedural and distributive justice found consistent support for the fair process effect (Brockner and Wiesenfeld 1996), and these findings helped solidify the distinction between procedural and distributive justice.

*Interactional justice*. Interactional justice originally was considered a subcomponent of procedural justice, but was presented as a completely separate form of justice when Bies and Moag (1986) provided arguments that people are not only sensitive to the process of decision-making but also to the quality of interpersonal treatment they receive during the enactment of organizational procedures. Some of the criteria that comprise perceptions of interactional justice include truthfulness, human dignity, and respectfulness. Truthfulness violations include lying, derogatory judgments, bad mouthing, and social undermining. Human dignity and disrespect violations include inconsiderate actions that demean or devalue the worth of an individual such as rudeness, abusive words, and invasion of privacy (Bies 2015).

Meta-analyses of justice research have demonstrated that interactional justice is, indeed, a separate dimension (Colquitt et al. 2001, 2013), and interactional justice has been examined extensively in the literature. For example, researchers have demonstrated that dishonesty and disrespect exhibited by authorities implementing decisions can lead to anger, resentment, and revenge (Bies and Tripp 1996; Tripp and Bies 2009). In addition, interactional justice has been related to several factors including job satisfaction (Laschinger 2004), job performance (Cropanzano et al. 2002), voluntary turnover (Tepper 2000), and trust in leadership (Cropanzano et al. 2007).

*Informational justice*. Informational justice was originally considered a subcomponent of interactional justice. As researchers began to examine interactional justice in more detail, however, it was separated into two distinct constructs, interpersonal justice and informational justice (Greenberg 1993). While interpersonal justice focused on being treated with respect and dignity, informational justice focused on the fairness of explanations and the timeliness of the information provided. Interactional justice and interpersonal justice are sometimes used as equivalent terms; both refer to being treated with respect and dignity. Meta-analyses of justice research have demonstrated that informational justice is a distinct construct and has a unique impact on outcome variables (Colquitt et al. 2001, 2013).

*Overall justice*. Researchers have focused on distributive, procedural, interactional, and informational justice for many years to examine the distinct nature of each type of justice in the workplace. A potential downside of continuing to examine each type of justice as a separate construct is the shared variance that often exists between the four types of justice. This shared variance creates the possibility of underestimating the influence of justice. As a result, some researchers argue that a measure of overall justice may be more appropriate in capturing the holistic effect of justice in a workplace environment (Ambrose and Arnaud 2005; Ambrose et al. 2015). There are a number of published measures of overall justice in studies which have found support for overall justice as a separate,

more global, dimension of justice (Ambrose et al. 2015).

## Organizational Justice Theories

*Instrumental model of justice*. The instrumental model of justice (Lind and Tyler 1988), originally called the self-interest model, is based on social exchange theory (Blau 1964; Homans 1958) and suggests that people try to maximize their personal gains when interacting with others. People join groups because they believe they will gain in the long run from group membership, and one way to ensure they will benefit from long-term group membership is to insist on fairness in decision-making procedures. For example, Easton (1965) questioned why citizens do not overthrow a political system when their candidate does not win. He theorized that if citizens believe the underlying political processes are fair, their membership in the political system will serve them well over time. The instrumental model proposes that people are concerned about their own outcomes so they desire process control such as voice (or voting in the Easton example) when decisions are made. Although personal gain is a strong motive for accepting a decision-making procedure, people sometimes act in generous ways and put their own self-interests aside. Thus, the relational models of justice incorporate a slightly different view of human nature into the justice literature.

*Relational models of justice*. There are three models of organizational justice which are based on the relationships individuals have with other people: the group-value model (Lind and Tyler 1988), the relational model of authority (Tyler and Lind 1992), and the group engagement model (Tyler and Blader 2000). The group-value model of justice (Lind and Tyler 1988) is based on social identity theory (Tajfel and Turner 1979) and suggests that group identification influences behavior. The model assumes that people value their membership in groups because groups provide members with an identity and norms concerning decision-making and fair treatment within the group. Interpersonal treatment is particularly important in the group-value model because people who are treated with respect and allowed input into the decision-making process are predicted to be more accepting of negative outcomes than are people who are treated disrespectfully and whose views are ignored by decision-makers.

The relational model of authority (Tyler and Lind 1992) examines the factors that authorities (managers, police officers, etc.) need to function effectively and is similar to the group-value model in that group identity and respectful treatment are key in predicting perceptions of procedural justice. Specifically, perceptions of an authority's neutrality, trustworthiness, and status recognition appear to have more impact on reactions to decisions than control factors tied directly to an outcome (Blader and Tyler 2015).

The group engagement model (Tyler and Blader 2000, 2003) argues that perceptions of procedural justice experienced within a group influence the extent to which individuals will identify with their group. Thus, rather than group identity driving perceptions of procedural justice as in the group-value model, "the group engagement model argues that the relational message conveyed by fair or unfair procedures will, over time, have an impact on whether people identify with their group" (Blader and Tyler 2015, pp. 354–355).

The relational models focus on social identity with a group and argue that procedural justice matters because it conveys how the decision-making authority regards the individual receiving the decision outcome. If the group or the authority treats the individual with respect and allows the individual to feel like a valued member of the group, the individual regards the group or authority as more legitimate and is more willing to accept decisions made by the group or the authority (Blader and Tyler 2015).

*Counterfactual thinking in justice*. Two models of organizational justice are based on the idea of counterfactual thinking, or thinking that is counter to the facts of a situation, such as the practice of imagining that a better decision outcome would have been received if only something different would have occurred. Referent cognitions theory

(Folger 1986) and fairness theory (Folger 1993) examine negative reactions to unfavorable decision outcomes by using counterfactual thinking and relative deprivation theory (Stouffer et al. 1949).

Relative deprivation occurs when an individual feels deprived or entitled to something based on a comparison to someone else. A classic example of relative deprivation is the comparison of a private in the Military Police and a private in the Air Force. Both have the same rank, education level, and tenure in the military, but the Air Force private feels deprived because he has not received a promotion in the Air Force which has a history of rapid promotions. The Military Police private does not feel deprived because promotions in the Military Police are not as rapid or prevalent. It is the comparison to a referent group or individual that creates the feeling of being deprived (Stouffer et al. 1949).

Referent cognitions theory illustrates how procedural justice concerns and distributive justice concerns can together influence an individual's reaction to a decision. A referent cognition occurs when individuals look at what actually happens in a given situation and think about all the other outcomes that could have occurred using different procedures. Referent cognitions theory suggests that resentment that comes from feeling deprived is ". . .maximized when three conditions hold:

1. Referent outcomes are high, meaning that a better state of alternative affairs easily could be imagined.
2. The perceived likelihood of amelioration is low, meaning that there is little hope that future outcomes will be better.
3. Justification is low, meaning the event ought to have occurred differently" (Colquitt et al. 2005, pp. 36–38).

Fairness theory (Folger 1993), an extension of referent cognitions theory, looks at the accountability of authorities when deciding if an event is just or unjust using counterfactual thinking. Accountability is based on three judgments: would, could, and should. After a negative event occurs, individuals ask themselves, "Would I have been better off if a different outcome or procedure had occurred? Could the authority have behaved differently? And should the authority have behaved differently?" If individuals believe the answer to all three questions is yes, they are likely to hold the decision-making authority accountable for the negative event and perceive feelings of injustice about the event.

Fairness theory is interesting in that it combines into one theory elements of distributive justice, procedural justice, and interpersonal justice, but not in a strict typology. For example, the would question loosely addresses the outcome or distributive justice element of an event by envisioning a different outcome. The could question loosely addresses the procedural justice element by acknowledging that the authority "could" have used a different process. The should question loosely addresses the respectfulness or interpersonal justice element by acknowledging the authority "should" have acted in a different manner to prevent the negative outcome. Although the three questions are not formally categorized into one type of justice, the theory allows researchers to examine each question as a separate type of justice in situations for which that approach is beneficial.

*Heuristic models of justice*. Two models of organizational justice are based on using heuristics in forming perceptions of justice: fairness heuristic theory (Tyler and Lind 1992) and uncertainty management theory (Lind and Van den bos 2002). Fairness heuristic theory argues that individuals use initial cues about the workplace to form judgments of what is fair or unfair in the workplace. These cues form a heuristic, or rule of thumb, that is used to interpret the fairness or unfairness of subsequent workplace experiences. Because these heuristics are formed quickly, a primacy effect is created such that the first information presented has a greater effect on subsequent perceptions of justice than later information. However, fairness heuristic theory also predicts that when workplace events violate expectations (events referred to as phase-shifting events), individuals may reevaluate the fairness

heuristic based on the more recent evidence of fairness (Proudfoot and Lind 2015). For example, employees who initially used cues to judge an authority as fair, but later were treated unfairly by that same authority, reacted more negatively to the unfair treatment than employees with no prior information on the fairness of the authority (Jones and Skarlicki 2005).

Uncertainty management theory proposes that attention to justice issues becomes more prevalent during times of uncertainty. Studies have shown that when people experience high levels of uncertainty such as when thinking about death (van den Bos 2001) or experiencing a lack of authoritarian management in the workplace (Thau et al. 2009), perceptions of fairness were more pronounced than when experiencing low levels of uncertainty. The theory suggests that organizations experiencing known uncertainty, during layoffs or mergers, for example, might want to focus on fairness since that is the time in which employees would be most receptive to fairness information. The heuristic models of justice may support the idea that justice is dynamic in nature, or fluctuates over time (Lilly et al. 2010), and studies that examine the impact of justice at one point in time may not capture the full nature of justice (Lilly et al. 2015; Patient et al. 2015).

## Conclusion

Organizational justice has been examined in thousands of studies over the past few decades, and the knowledge gained generally supports the following premises:

1. When people believe they are treated fairly, they are more likely to accept negative decisions in the workplace.
2. When people believe they are treated unfairly, they are more likely to engage in deviant workplace behavior such as absenteeism, theft, sabotage, etc.
3. Organizations that cultivate workplaces demonstrating respect for all employees may help employees better identify with the organization as being part of the in-group which, in turn, helps employees to be more likely to accept organizational decisions.

# Organizational Justice and Public Performance in Greece

Evangelia Mylona and Dimitrios Mihail
Department of Business Administration, University of Macedonia, Thessaloniki, Greece

## Synonyms

Effectiveness; Organizational fairness; Productivity; Public administration; Public management; Work outcomes; Workplace fairness

## Definition

The term organizational justice refers to several distinct forms of perceived justice (i.e., distributive, procedural, interpersonal, and informational) each of which offers a different answer to the question "What is fair?".

## Introduction

Nowadays, within the context of the global financial turmoil, managers of both the public and the private sector have to address the critical challenge of fostering employees' well-being in order to enhance motivation and job performance.

As a result of the unfavorable economic conditions, global real wage growth has fallen from 1.6% in 2012 to 0.9% in 2015. Across EU countries there are, however, remarkable differences in the real wage growth. According to the European Commission Data (Eurostat 2015), compensation per employee grew in the euro area at 1.4% in 2014, a record low, while the compensation per employee dropped in the following EU Members, i.e., Greece, Cyprus, Portugal, and Slovenia.

In Greece, which has been severely impacted by the debt crisis, it is timely to examine employees' performance under the ongoing Memorandum austerity measures imposed since May of 2010. Workers in Greece, in both the public and private sector, have felt the effects of pay cuts and losses in income and purchasing power. Nevertheless, cost-saving measures were higher in the public sector than in the private sector. For decades, Greek public sector employees have been earning significantly higher wages than their private sector counterparts. Greece's recent fiscal crisis has initiated a reversal of this trend, with drastic public-sector pay cuts. Collective bargaining as a mechanism to determine public sector pay was disregarded by the government and a law passed in 2011 establishing uniform pay scales across the public sector. In addition, the new wage system put restrictions on the distribution of extra allowances and prohibited any raise based on merit or seniority. However, while a uniform pay scale may exist in law, considerable variations continue to exist in the salaries paid to state and semi-state employees, as there are still some civil servants that receive extra bonuses, that are not aligned with job achievements, performance (individual/organizational), or seniority and thus raising concerns of equal distribution of allowances and fair treatment.

Previous research has noted the importance of fairness in the workplace and indicated that employees' perceptions of workplace justice are positively associated with beneficial outcomes for both employees and firms. Organizational justice is found to be an important determinant of employees' attitudes, behaviors, and performance at the workplace. Employees who perceive higher levels of both distributive and procedural justice are more likely to respond with higher levels of job satisfaction (Greenberg 1990), organizational commitment, (Folger and Konovsky 1989), job performance (Konovsky and Cropanzano 1991), and lower levels of turnover intentions (Dailey and Kirk 1992).

Accordingly, it is suggested that underpayment inequity and lack of justice in firms is related to higher levels of employees' stress (Adams 1963) and negatively related to the level of cooperation of co-workers (Pfeffer and Langton 1993), the quality of work, self-image, and moral outrage (Schroth and Pradhan 2000).

Since studies on work performance have mainly involved developed economies, insights regarding financially distressed countries such as Greece, the first country so severely affected by Europe's financial crisis, are both timely and relevant. Investigating antecedents of work performance in Greece aims to enrich the knowledge and understanding of how employees may respond to unfair work environments in the context of financial distress and, furthermore, aims to provide relevant practical implications on how managers can do more with less.

## Organizational Justice

In recent years, the research on work-place justice has gained considerable attention. The study of fairness in psychology started with Adams's work on equity theory (Adams 1963) emphasizing the perceived fairness of outcomes. Organizational justice can explain a wide range of employee behaviors and highlights the importance of the ideals of justice and fairness as a requirement for organizations to function effectively. In particular, the term organizational justice refers to several distinct forms of perceived justice, each of which offers a different answer to the question "What is fair?".

Researchers have identified four types of justice perceptions: distributive, procedural, interpersonal, and informational. *Distributive* justice refers to the fairness of outcomes for individuals in comparison with what others receive. *Procedural* justice refers to whether the decision-making processes ensure consistency and whether recipients of these decisions have the opportunity to influence the process. Accordingly, *interpersonal* justice refers to whether one is treated with dignity and respect when decision processes and decisions themselves are implemented, while *informational* justice refers to the extent to which employees feel that they have adequate information as decisions are implemented.

Previous studies have shown that each form of justice has unique relationships with various outcomes. Whereas the most relevant forms of justice when considering the allocation of monetary rewards (e.g., pay compensation, merit pay, bonus decisions, and gainsharing) are distributive and procedural, the relational forms of justice (interpersonal and informational) demonstrate higher correlations with supervisory outcomes (i.e., leader-member exchange, trust, perceived supervisory support), since they are conceptualized as being under the direct control of the supervisor. Considering the Greek context, this argument seems even more salient. Due to the centralization of the Greek public sector and since pay decisions are made at a governmental level, public sector managers cannot interfere with pay policy decisions as they cannot control and determine the allocation of resources.

## Distributive Justice

Traditionally in Greece, a minimum wage at a national level used to be established and determined by the National General Collective Agreement (EGSSE), a collective agreement signed between Greece's most representative organizations of employees and employers. The national salary used to be comprised of the base salary and two additional allowances, namely, the seniority allowance and marriage allowance. The austerity measures implemented from 2010 resulted in substantial changes in the Greek labor law and introduced a wage-setting system where the starting minimum wage was set at €586.08 (from €751.39) and prohibited any raise based on seniority. In other words, the new wage system in Greece determined uniform pay scales and is applied horizontally to both private and public-sector employees. Nevertheless, as noted, there are still some considerable variations concerning the salaries paid to civil servants. For instance, based on data released by the Greek Parliament, it is evident that some low and middle-rank public-sector employees of specific organizations, regardless of performance criteria, earn higher wages compared to their counterparts in the public and the private sector. Wage changes during the Greek crisis varied widely across sectors and over time. The considerable cumulative decrease in average gross earnings in total economy entailed cuts in public sector salaries and institutional reforms towards greater labor market flexibility. However, the reductions in earnings differed strongly across individual sectors of the economy

but also within sectors (e.g., within the government sector). Hence, while a uniform pay scale may exist in law, it does not actually occur in the labor market, and there are still some employees who receive allowances that are not aligned with performance outcomes (individual/organizational), merit, or seniority and thus, raising issues of unfair distribution of rewards.

Since decisions about the distribution of pay are based on unclear criteria, the wage structure of the public sector turned out to be a "black box." In such conditions that hinder transparency and clarity, employees are more likely to compare themselves with peers. Social comparisons – comparisons between the self and others – are a fundamental psychological mechanism influencing people's judgments, experiences, and behavior (Festinger 1954). According to Festinger's social comparison theory, people evaluate their personal and social growth based not only on their own characteristics but on what others have achieved. Based on the organizational justice and the social comparison theory, one could propose that employees' satisfaction with pay is affected not only by actual compensation factors (for instance the actual level of salary and benefits) but also by peer salaries and specifically by their perceptions of distributive justice.

### Procedural Justice

Over the past two decades, major attempts have been made in Greece to improve the processes and procedures of the performance appraisal assessment system in the public sector. The most recent reform Law (4369/2016) was put in force in January 2017 and introduced a new evaluation system. According to the law's explanatory memorandum, the main objectives are to tackle the problem of politicization of the public administration and bureaucracy, and to introduce modern staffing policies. For the first time after the Memorandum Agreements, the recently passed Law (4369/2016) combined with Law 4354/2015, which was applied in January 2016, aimed at linking wage progression with seniority, qualifications, and performance.

The compensation literature has shown that it is important to consider procedural justice in understanding individual reactions to unfair treatment because employees turn to pay-related procedural information to judge the fairness of their outcomes.

## Conclusion

In a period of economic crisis, the reduction of governments' revenue and the increasing pressure of sparse financial resources are factors pushing and forcing managers of public organizations to do more with less. The current study responds to this call and explores how employees' performance in the public sector is affected by perceptions of fairness. Specifically, this research investigated how employees' level of work effort and work quality is affected by perceptions of distributive and procedural justice.

Using the psychological contract theory as the overarching theoretical framework, this study expands researchers' understanding of the extent to which employees feel that they have been fairly treated, regardless of actual pay levels. Therefore, the results of this study posit that in contexts of economic crisis and limited financial resources, the need of nonfinancial incentives is intensified when organizational management cannot rely solely on monetary rewards. As organizations face challenges in providing competitive compensation, benefits, and training programs, it is evident that the focus should lie on fairness and justice as the most cost-effective approach to enhance motivation and productivity of employees.

The findings suggest several practical implications for public organizations. Since it is well established that positive attitudes and behaviors lead to enhanced job performance, the linking of human resources management and justice appears to be of utmost importance. It is argued that the human resource management departments in public administration, in collaboration with managers, should ensure that all HR practices and policies are in line with the values of fairness and justice. Managers are expected to view the establishment of fair business norms and just systems favorably as the most viable, economical,

and effective approach of not only enhancing employees' attitudes (satisfaction) but also employees' outcomes (work effort and work quality) and organizations' performance. One way to achieve this would be for managers to ensure that all resource allocation decisions are to be taken in an objective, visibly, and impartial manner. This is of particular importance, as fair managers can play an important role in making the organization fair because fair treatment can generate similarly ethical behavior in those receiving.

In addition, public administration should foster a direct open communication culture between management and employees. Creating an environment in which employees feel free to voice their concerns about decisions would facilitate trust towards managerial actions and develop a feeling of common interest and justice for all members (subordinates and supervisors). Accordingly, the participation of employees in the decision-making process would allow public organizations to move away from the traditional hierarchical structure to participative management. In such organizational environments, managers are more likely to exhibit a consultative or participative leadership style rather than a dictatorial or authoritarian one, thus having a positive effect on employees' perceptions of trust and organizational justice.

Furthermore, public organizations should make sure that they take into consideration the different contribution levels of employees when distributing rewards. When HR managers and public sector line managers treat every employee equally, then this could be unfair if they participated and contributed at different levels. Therefore, fair allocation of resources (distributive justice) through the establishment of performance-based schemes (procedural justice) should be designed and implemented. Effective performance-based schemes, such as merit pay and pay-for-performance systems, have been widely used in the private sector as an important component of the employee pay mix. Such schemes are designed to motivate employees by providing incentives to those who achieve, improve, or exceed their performance.

Nevertheless, performance-based schemes are unlikely to be effective unless they are supported by a formal appraisal system that documents and evaluates employees' performance. Appraisal and performance review systems would allow employees who are more qualified or those who contributed more than others to receive a greater share of rewards and would ensure both distributive and procedural justice in organizations. An alternative plan to ensure justice in public organizations is to base individual pay on the specific difficulties of the job or the level of responsibilities. In such pay plans, payments are made to employees who are taking on additional responsibilities over and above those set out in their job description and at a higher level.

# Organizational Learning

Ignacio Cienfuegos
Universidad Alberto Hurtado, Santiago, Chile

## Synonyms

Learning organizations; Organizational acquisition; Organizational innovation

## Definition

Organizational learning explains the way individuals learn new knowledge within organizations by setting structures, mental maps, values, practices, routines, and frameworks. Accordingly, organizational learning proposes that entities are not only influenced by individual learning processes, but organizations influence the learning of individual members and conserve what has been learned. Although this perspective recognizes the individual as the only entity capable of learning, he must be seen as being part of a larger learning arrangement in which individual knowledge is exchanged and transformed.

## Introduction

This chapter aims to discuss the theoretical assumptions behind organizational learning, looking into the theories on organizational change, which consider different perspectives for explaining how organizations modify their structures, practices, values, and knowledge. Organizational change concepts assume organizations as institutions that have a history, a culture, a set of values, traditions, habits, routines, and interests (Jaffe 2001). With this perspective, organizational learning occurs when an organization decouples itself from the institutional context and reformulates its internal interpretive scheme (Paauwe 1998) revising its responses, rules, and structures (Meyer and Rowan 1977). Considered by De Schryver (2009), the two well-known and classical perspectives of change are the content and the process perspectives. As suggested by Rajagopalan and Spreitzer (1997), researchers in the first school have focused on the antecedents and consequences of change (e.g., Gibbs 1993; Ginsberg and Buchholtz 1990; Oster 1982 in by Rajagopalan and Spreitzer 1997). Alternatively, studies on the process school have focused on how entities react to organizational change, explaining and describing the process of changing and examining the sequence of events as change unfolds in the organization (Van de Ven and Poole 2005). Consequently, although the chapter develops a comprehensive review of organizational learning, it focuses our analysis on the process perspective of this line of literature, especially the approach that suggests the use of a stage model for the description and explanation of change within organizations.

## Motors of Organizational Change

First of all, the article uses the framework proposed by Van de Ven and Poole (1995) as a device that will help us with the theoretical classification of the process of change, an approach that might guide us further in the task of identifying the theoretical assumptions that are considered during the process of organizational learning. These scholars have defined four motors that would explain change and that would operate at different organizational levels: *life cycle*, *teleology*, *dialectics*, and *evolutions*. This illustrates a process that unfolds these changes as well as proposes a description of organizational change. From that perspective, it is likely to identify concepts borrowed from other disciplines such as stages of growth, processes of decay and death, population ecology, and development. The authors state that all specific theories of organizational change can be built from one or more of these four basic types of change mentioned (life cycle, teleology, dialectics, and evolutions) serving as theoretical bases that could facilitate the integration of related explanations (Van de Ven and Poole 1995).

Stated by Van de Ven and Poole (1995), the *life cycle* motor would be a heuristic device that

management has used in order to explain the development of organizations from an initial phase to their termination. It is common to distinguish this metaphor in the literature when referring to products, ventures, or organizations. The life cycle approach aligns partially with the logic of risk maturity and maturity models in general, considering that this approach explains changes as progressions to a final state, transformations that would be prefigured and would require a specific sequence of events (Van de Ven and Poole 1995). The *teleological* approach, identified by Van de Ven and Poole (1995), suggests that the persistence of goals is another motor that guides change in an entity. From this perspective, the development or progression of an organization would proceed toward a specific goal. According to the authors that follow this approach (March and Simon 1958; Etzioni 1963; March and Olsen 1976 in Van de Ven and Poole 1995), development in organizations takes part in a repetitive sequence of formulation, implementation, evaluation, and modification of goals based on what was previously learned by the organization. As stated by Van de Ven and Poole (1995), in this approach, however, there is no prefigured rule or a logically necessary direction or even a set of sequences that an entity should follow in order to progress.

Under the *dialectical* heuristic for explaining organizational change, organizations are conceived as entities where colliding forces and values compete with each other for prevalence. From this perspective, change would occur when these opposing values or forces gain sufficient power to confront the status quo. So in a dialectic point of view, the power of an antithesis may mobilize an entity to a sufficient degree to challenge the current thesis and then produce a "synthesis" (Van de Ven and Poole 1995). This dialectic process where a new thesis is constructed may suggest a sequential transformation of current paradigms, values, and practices within the organizations. This might be consistent with the logic of maturity models, since it suggests that the organization, in order to progress to a next level of risk maturity, should implement a more sophisticated and novel "thesis."

Finally, the *evolutionary* perspective of change discussed considers change in organizations as being cumulative. In the same manner that change is explained in biological evolution, change in organizations according to this perspective progresses through a continuous cycle of variation, selection, and retention. This assumes that cumulative changes are prescribed through the implementation of specific practices, thus retaining the knowledge and practices acquired in the previous level of "maturity." From this perspective, entities do not evolve randomly to the mastery of a particular discipline, as changes in demographic or actuarial probabilities occurred; on the contrary, organizational learning under this view may suggest a deterministic path for the organizations to reach a more mature state.

Although the authors of this framework for the classifications of theories of organizational change and learning present the different motors in dimensions that might be mutually exclusive, they also recognize potential combinations of the different approaches and even the possibility of developing an eclectic mechanism that could explain in a more complete way the theories of organizational change and summarize the characteristics of the basic types of process theories of the change discussed. The chapter will focus now exclusively on stage models for explaining organizational learning, with the confidence that this approach will give complementary elements for the development of the theoretical foundation of this line of literature (Table 1).

## Stage Models in the Grounds of Organizational Learning

Damsgaard and Scheepers (2000) highlight the *evolutionary* perspective of change models by stating that stage models emphasize the direction of change (typically as a succession of stages in which each stage is a precursor for the next one) through which an entity increases its complexity or perfection over time, ultimately reaching an end state. From that perspective, stage models view the progressive stages as a necessary optimization of an entity's structures for survival.

**Organizational Learning, Table 1** Specific characteristics of the four basic types of process theories that are present in maturity models

| Life cycle | Evolution | Dialectic | Teleology |
|---|---|---|---|
| Changes as progressions to a final state occur | Progression through a cycle of variation, selection, and retention | Colliding forces and values compete with each other for prevalence | The development would proceed toward a goal |
| Organic growth | Cumulative changes | New thesis is constructed | Repetitive sequence of formulation, implementation, evaluation, and modification of goals |

Based on Van de Ven and Poole (1995)

Thus, each new stage represents a set of features that are superior to the old features (Damsgaard and Scheepers 2000). Researchers more interested in explaining how organizations grow (e.g., Phelps et al. 2007; Kazanjian and Drazin 1989; and Mintzberg 1984) focus more on the *life cycle* perspective of stage models. The life cycle approach applied to stage models suggests that just like living creatures, organizations have life cycles; therefore they develop by following a necessary sequential and predetermined pattern of change and transformation (Lippitt and Schmidt 1967 in Phelps et al. 2007).

Stubbart and Smalley (1999) claim that there are five principal assumptions behind stage models. First of all, stage models represent a *programmed process*, meaning that change within entities occur in only one direction as a consequence of a predetermined route. This assumption also considers that organizations move through this programmed path to a final state of maturity by acquiring specific skills, knowledge, practices, and beliefs (Huy 2001). The second assumption has to do with the idea of stage models as devices that *specify transformational change*. This suggests that in order to work, stage models must be predictable but consider abrupt transformation between stages (Amis et al. 2004). This radical transformation from previous stages involves a significant alteration of many organizational elements such as formal structures and work systems (Huy 2001). In addition, stage models require a one-way movement along a designated linear path. This unidirectional pattern of movement is consistent with the "maturational" logic borrowed from biology. A logic of *progression* is also implicit in stage models (Stubbart and Smalley 1999). In this perspective, *progress* is assimilated to the development to a higher and optimal state (blossoming or growing up), a situation that is acquired through the completion of stages. Probably the most controversial postulation of stage models is that these models are assumed to have the virtue of minimizing the effects of context and history. This is demonstrated by the fact that stage models take historical and environmental factors as having been fixed, in the same manner as physical growth proceeds largely independent from the person's social and physical environment. As a consequence, the entities are viewed as largely isolated from environmental contingencies (Stubbart and Smalley 1999).

As reported in the literature of stage models, this last assumption constitutes one of its main limitations. This criticism is developed mainly from a historical and institutional point of view applied to organizational change, which sustains that historic and contextual facts are essential elements for explaining any case of change process description (e.g., Stubbart and Smalley 1999; Barley and Tolbert 1995 in Feldman 2000). The maturational reasoning behind stage models, where no environmental forces would influence the organizational transformation, neglects the historical and environmental consideration.

Stubbart and Smalley (1999) also offer a framework for the evaluation and construction of stage models. They first suggest that a stage model should mention the specific usage of stages in a particular research. According to the authors, there would be three main varieties of stage models: metaphorical, descriptive, and causal. Under the metaphorical perspective, stage models would be used mainly as devices to communicate

or illustrate theory or concepts. The stages designed in such models could not be considered as variables, concepts, or constructs, but more as provisional terms for a deductive construct. On the other hand, the descriptive usage of stage models according to these scholars represents aggregate events, features, characteristics, or behaviors that are correlated. Stage models considering this approach are emergent patterns or composite independent variables that are based on empirical evidence. Finally, casual stage models develop stages as independent variables and connect those stages with causal significance. In that sense, causal stage models do not focus strictly on the detection of patterns of activity or behavior, but identify the existence of a specific sequence of stages that explain and govern the formation, growth, transformation, or maturity of those stages (Stubbart and Smalley 1999).

For the evaluation of stage models, Stubbart and Smalley (1999) suggest that a stage model should provide "evidence of the abrupt transformations" that it suggests. This means that such a model should distinguish between the transition from one stage to the next in a discontinuous and abrupt manner. Additionally these authors mention the necessity to "fully define all independent or dependent variables" involved in the stages. This indicates that when constructing a stage model, the researcher should separate identification and measurement of dependent and independent variables that would be used as explanatory factors of the different stages. Moreover for the evaluation of the stage model, the authors suggest that the researcher should identify the "causal forces driving the stages"; it would only be applicable for causal stage models that define and measure the variables that produce the stage pattern. Finally, these authors propose that when constructing a stage model, researchers should not "overwork" the stages. This refers partly to the extension of the stage model, but more specifically to the idea that authors should not pass metaphorical or theoretical ideas as findings or even causal factors. This is also related to the first suggestion that prescribes a clear definition of the usage of stage models. An illustration of this framework for the evaluation of stage models is presented in Fig. 1.

Despite the underlying weakness of stage models mentioned previously (the fact that stage models take historical and environmental factors as being fixed), it is reasonable to argue that they are pertinent instruments that can be used in the conceptual discussion of maturational learning within organizations (Stubbart and Smalley 1999; Phelps et al. 2007). In this perspective, learning would be reflected in tangible and incremental actions (Argyris and Schön 1978) that shape, and are shaped by, the environment (Rajagopalan and Spreitzer 1997).

## An Organizational Learning Perspective of Change and Single and Double Loop

Taking into account the different interpretations of organizational learning, there does not exist at the moment a successful consensus on the concepts and terminology of the discipline (Visser 2007). Therefore it is indispensable to be very clear as to what specific line of the theory has been used.

As mentioned by Easterby-Smith et al. (2000), one of the principal debates concerning

**Organizational Learning, Fig. 1** Criteria to guide evaluation of stage models (own elaboration, based on Stubbart and Smalley 1999)

organizational learning refers to the idea of whether organizational learning is simply the sum of what individuals learn or whether there is something more to it. The debate is situated as to whether it is meaningful to think of organizations as having objectives, learning abilities, and memories or if organizations only learn through their current, individual members. This review of organizational learning theory relies on the second approach, considering learning in organizations as individual learning taking place, yet in a social context (Holmqvist 2003).

Consequently, the chapter concentrates on the way individuals learn within organizations by setting structures, mental maps, values, practices, routines, and frameworks (e.g., Senge 1990; Dixon 1994 and Argyris and Schön 1978 in Van der Bent et al. 1999). Following this approach, organizations are not only influenced by individual learning processes, but organizations influence the learning of individual members and conserve what has been learned (Romme and Dillen 1997). Although this perspective recognizes the individual as the only entity capable of learning, he must be seen as being part of a larger learning arrangement in which individual knowledge is exchanged and transformed (Romme and Dillen 1997). As discussed by Argyris (1991), organizations learn through individuals acting as agents for them. The individuals' learning activities are facilitated or inhibited by ecological or contextual factors that may be called an organizational learning system (Argyris 1991).

The seminal work of Argyris and Schön (1978) stresses the cognitive aspects of learning new frames of reference in an evolutionary manner (Huber 1991). In this perspective, one of the most important distinctions of the theory is the difference between "espoused theory" and "theory-in-use" (Argyris and Schön 1978). As mentioned by the authors, espoused theory is the theory of action, meaning the theory that an individual, upon request, communicates to others. However, the theory that actually governs the actions of an individual is the theory-in-use. As clearly stated by Argyris and Schön (1978), people in organizations design and guide their behavior by the use of theories of action that they hold in their heads. Espoused theories of action, therefore, would be theories that individuals declare or report as governing their actions (Argyris 1982).

As discussed by private images of the same organization might diverge from one another. When the organization is large and complex, most members are unable to use face-to-face contact in order to compare and adjust their different images of organizational theory-in-use. They might then require external reference, public representations of the organizational theory-in-use to which they can refer. In the view of Argyris and Schön (1998), this is the function of "organizational maps," instruments that constitute shared descriptions of the organization by individuals. These organizational maps might include diagrams of work flow, routines, practices, statements of procedure, and also policies or programs of a particular administrative perspective. They would then describe actual patterns of performance, as well as guides for future actions. These maps or guidelines would be the media of organizational learning (Strutt et al. 2006).

As stated by Argyris and Schön (1978), members of the organization respond to changes in the internal and external environments of the organization by detecting errors and problems, which they correct in order to maintain the central features of organizational theory-in-use. Therefore, the organization's ability to remain stable in a changing context might denote a basic learning. Following Bateson (1971), Argyris and Schön (1998) state then that there is a *single feedback loop* which connects detected outcomes of action to organizational strategies and assumptions that are modified so as to keep organizational performance within the range set by organizational norms. As mentioned by Levitt and March (1988 in Van der Bent et al. 1999), routines and responsibilities defined in an organization (theories-in-use) will facilitate learning more than those where responsibility is vague.

Consequently, *single-loop* learning may be sufficient where error correction can proceed within a constant framework of norms for performance. It is concerned primarily with effectiveness, meaning how to best achieve existing goals

and objectives and how best to keep organizational performance within the range specified by existing norms. However as mentioned by Burke (1987), in some cases error correction requires an organizational learning cycle in which organizational norms themselves are modified. As discussed by Hong (1999), the single-loop approach where organizations learn from their own experiences, adjusting their actions to existing norms and frameworks, would be beneficial for the organization in short run, configuring a problem of "myopia of learning" in the long term (Levinthal and March 1993 in Hong 1999). This phenomenon will occur because organizations will be less willing to engage in novel actions to explore new techniques due to past relatively successful stories or from neglecting of the distant future (Hong 1999). Insights might be necessary, in order to improve existing skills and routines, changing, therefore, the central norms and underlying assumptions (Argyris and Schön 1978, 1996 in Hong 1999).

As a result, the concept of *double-loop* learning is a response to the latter situation, where an inquiry is performed in order to redefine the organizational norms and restructure the strategies and assumptions associated with those norms (Burke 1987) (see Table 2 for an overview of the main characteristics of organizational learning).

This approach of organizational learning, and especially the perspective of Argyris and Schön (1978), makes a strong case for explaining the acquiring of knowledge and the process of learning through incremental stages. As other researchers have also considered (Strutt et al. 2006; MacGillivray et al. 2006), it is possible to claim that this approach, particularly the concepts of single- and double-loop learning (Argyris and Schön 1978), could be of assistance to explain the reasoning behind the transitional perspective that organizational learning assumes.

**Organizational Learning, Table 2** Single- and double-loop learning

| Single-loop learning | Double-loop learning |
|---|---|
| Based on repetition routine within existing structures | Based on cognitive process and understanding routine |
| Change of behavior or performance level | Change of organizational framework |
| Problem-solving capacity | Developments of new processes, routines, and practices |

Adapted from Fiol and Lyles 1985 in Romme and Dillen (1997)

By studying and evaluating the theoretical assumptions that are implicitly proposed in this approach of organizational learning, it is thinkable to recognize and make several links with other aspects of the theory of organizational change. For example, as claimed by Romme and Dillen (1997), single-loop learning would be the result of replication of routines that facilitate decision-making by means of specific rules, while double-loop learning might involve changes in the fundamental norms underlying actions and behaviors. Consequently, as discussed by Easterby-Smith et al. (2000), researchers have tended to use single- and double-loop learning as a shorthand expression to describe what they see as more routine learning versus more radical learning.

This perspective of organizational learning conceives organizational change not as linear but as evolutionary process where the entity learns first from its experience (single loop) and then, as commented before, higher learning (double loop) would occur through significant breaks from past strategies, completing a radical change approach (Lant et al. 1992; Tusham et al. 1985 in Rajagopalan and Spreitzer 1997). These major modifications could be identified in the theory of learning of Argyris and Schön (1978) by the transformation from single to double loop, where the entity shifts from an "archetypal" configuration (Amis et al. 2004) to a novel theory-in-use (Argyris and Schön 1978).

Considering the four motors of organizational change of Van de Ven and Poole (1995), one could also claim that the approach of Argyris and Schön (1978) is not only evolutionary but also dialectical. This statement is possible observing the Hegelian assumption (Van de Ven and Poole 1995) of the double loop, considering that current values and beliefs (theory-in-use) have to be questioned and modified in order to develop a new thesis (novel responses, practices, beliefs,

routines, etc.). This perspective of organizational learning might be classified also as teleological, since it is based in a "constructive mode of development," in which the process is emergent as new goals are enacted in the organization (Van de Ven and Poole 1995 in Feldman 2000).

As commented before, it is also clear that under this approach of organizational learning, changes in the organization are assumed to take place through the transformation of routines, which is considered to be part of how organizations performed (Cyert and March 1963; March and Simon 1958 in Feldman 2000). The relevance of routines is commented by Argyris (2009) himself, considering routines as an expression of the theory-in-use of the entity, which is manifested in what he called "actionable" knowledge. This highlights the suggestion by the author, in terms that are by the means of concrete actions expressed in practices and routines, that could evaluate the modification of knowledge within an organization (Nonaka and Takeuchi 1995 in Feldman 2000).

This perspective of the theory of organizational learning assumes as well a planned change process (Huy 2001) where there is a necessity of intervention for the alteration of current practices and beliefs. This is easily identifiable in the typology of loop learning of Argyris and Schön (1978). As claimed by Huy (2001), the "theory of action" method aims to probe incongruence between espoused theories and theories-in-use, as well as map organizational structures in order to uncover vicious causal loops or erroneous "mental maps" (Senge 1990) that are conceived as root causes for the change of behavior (e.g., the implementation of the best practices prescribed in the managerial literature). In order to alter the theory-in-use and modify the organization's beliefs and structures (double loop), external intervention (outside agents) might be required to help convert the tacit causes of ineffectiveness into explicit formulations, since the organization and its employees are often cognitively limited and trapped by their own assumptions (Huy 2001). Specifically, stressed in the literature of modern management is the necessity of having "external support" for the analysis and implementation of the best practices. The latter would contribute to convert the tacit causes of infectiveness into expected formulations, since organizations (and their members) might be trapped by their own assumption (Huy 2001). External support in the implementation of the best management practices would then assist the organization in acquiring the new frame of references (theory-in-use) as a secondhand experience (Huber 1991).

Therefore, from the organizational learning perspective on change, managers would attempt to understand the ambiguous environment in which an entity operates. This includes iterative actions (e.g., information gathering) and understanding the context (threats and opportunities) (Koberg 1987; Lant and Mezias 1992 in Rajagopalan and Spreitzer 1997). Strategic imperatives, such as resources for the implementation and leadership, which are often discussed in the literature, and standards of management, are implicitly tied to change sequencing, because they inevitably affect the ways in which various parts of an organization will engage with the change process (Amis et al. 2004). Leadership, especially, will affect the ways in which various parts of an organization engage with the process of change (Amis et al. 2004), as well as actively influence the organizational theory-in-use (Argyris 2009). Following the whole "monitoring process" recommended by the literature of organizational learning and change, it is realistic to consider a form of information acquisition where the organization would "learn from its errors" (Huber 1991). As argued by Huber (1991), more organizational learning occurs when more of the organization's components obtains this knowledge and recognizes it as potentially useful. It is fundamental as well to develop an "organizational memory" by which knowledge is stored in the form of procedures and routines as well as non-routine information (Huber 1991).

Finally, the theory of organizational learning assumes that organizations have difficulties absorbing available knowledge (Cohen and Levinthal 1990); thus by learning from other entities, organizations could let the available knowledge pass through them (Greve 2005). In that sense peer organizations or expert networks and

associations that aim to develop "management awareness" and disseminate the best practices would be fundamental for the process of "learning" from others. The participation of entities and their members in these peer organizations could be seen then as a source of "interorganizational learning," since according to this line of literature, network ties would provide access to information and outflows of knowledge (Schulz 2001) for organizations through the interaction with peers, promoting an adaptive change (Kraatz 1998).

## Conclusion

This chapter studied the underlying theoretical structure of organizational learning, providing explanations in terms of the logic and assumptions of this line of literature. As a consequence, the chapter draws from the theoretical elements of organizational change in order to explain at least part of the reasoning of how organizations acquire new knowledge. The chapter has taken advantage of the framework elaborated by Stubbart and Smalley (1999) in order to analyze the different fundamental perspectives of the process of change and learning within organizations.

In addition, the document strongly relies on the propositions of Argyris and Schön (1978) about single- and double-loop theories of organizational learning in order to explain the transitions between having a limited knowledge of a particular discipline implemented in an organization and a more sophisticated perspective. This approach of organizational learning helps to respond to one of the main limitations of stage models, which is the assumption that changes within the organization will proceed largely independent from the person's social and physical environment (Stubbart and Smalley 1999). As discussed, this learning perspective establishes that the organization changes through a process of steps of learning designed to respond to both the environment and the organization (Rajagopalan and Spreitzer 1997).

It is not possible to neglect, however, the limitations of the perspective used to explain the learning process within organizations. It is indispensable to mention this considering some of the propositions of stage models in general, such as the inexorable positive progression through stages to a point of arrival that is implicit in these normative frameworks (Phelps et al. 2007). In fact, it is wise to think that in reality there is little positive evidence that organizational learning will occur in reality as it can be observed in living organisms (Stubbart and Smalley 1992 in Phelps et al. 2007). As stated by Amis et al. (2004), there appears to be a disjuncture between the normative conceptualization of change as developing in a predominantly linear manner and the evidence that suggests that radical change is instead characterized by delays and oscillations. Consequently it is not reasonable to disregard the fact that a deterministic approach, such as the one chosen in this chapter to explain the process of acquiring knowledge in organization, could also be explained with alternatives theories. Therefore, as mentioned by Stubbart and Smalley (1999), system dynamics, contingency theory, historical accounts, game theory, chaos theory, and complexity theory, among others, could also give some arguments to discuss how organizations learn in reality.

# Organizational Life Cycles

Michael R. Ford
University of Wisconsin-Oshkosh, Oshkosh, WI, USA

## Synonyms

Organizational life span; Organizational death

## Definition

Refers to the sequence of events from organizational initiation/birth to death.

## Introduction

The field of public administration has, from its beginnings, concerned itself with the organizations providing services to citizens. Traditionally these organizations have mainly been local governments and their departments and myriad state and local agencies. More recently, private and nonprofit organizations, via contracting, voucher programs, and other reforms that challenge traditional meanings of the notion of publicness too have become part of the organizational ecosystem providing services to citizens. A constant of organizations, be they public, private, or nonprofit, is change. Scholars of organizational theory explore the extent to which organizational change over time is predictable, asking if organizations experience life cycles in a manner akin to biological organisms, if organizational fates are governed by a degree of chaos, and if organizational trajectories are dependent on sector, context, or politics. The common thread holding the diverse scholarly approaches together is the belief that organizations are a relevant variable in determining the performance of the public and nonprofit sectors. Hence, organizational life cycle theory has both explanatory and normative values to the field of public administration.

### What Is the Study of Organizational Life Cycles?

Organizational life cycle theory refers to the belief that organizations behave in predictable ways between their founding and death. Economist Kenneth Boulding (1950) pioneered the study of organizational life cycles in a text arguing that organizations experience the common stages of birth, maturation, eventual decline, and death. An implicit assumption in Boulding is that organizations, even though they may experience periods of stability, are inherently unstable. The birth stage of an organization, under Boulding's typology, is primarily a struggle to survive. Maturation occurs after an organization has established a foothold into the marketplace. In this stage organizations develop external reputations and internal management systems. The period of decline, as it sounds, is characterized by diminishing efficiencies, declining customer bases, and a loss of profitability. Internally organizations will suffer from misaligned management practices that no longer optimally meet the needs of the organization and its stakeholders. The death stage is reached when an organization ceases to exist. It is characterized by an inability to turn a profit and meet basic operating costs like payroll and facilities.

Since Boulding proposed his broad typology, many scholars in the private and public management fields have expanded on the various stages

organizations experience over their life spans. Larry Greiner (1997) argued that organizations go back and forth between periods of stability and slow evolution and revolutionary periods of dramatic change. How and when these periods occur is a function of five different dimensions. The first dimension is age. Simply, younger organizations face different challenges and must make different decisions in response to these challengers than older organizations. Arguably the age of an organization is the most important contextual factor determining the trajectory of said organization. The second dimension, size, is also a contextual factor. Large organizations are expected to behave differently than smaller organizations, and it is impossible to make sense of their trajectories without considering their size. In studies of local government, for example, it makes little sense to assume urban and rural government organization face challenges that are similar in size and scope.

The third dimension is the presence of relatively stable evolutionary periods lasting 4–8 years. During the evolutionary periods, an organization's systems, goals, and customer base remain mainly consistent, with any changes being slow and incremental. The evolutionary dimension is important for the study of organizational life cycles because it imposes the assumption of stability over a time period. The fourth dimension is revolutionary periods characterized by major organizational changes in management practices, goals, and systems. Revolutionary periods may be brought on by internal forces such as employee demands and management changes or external forces such as new regulatory requirements, changing customer preferences, increased competition, or industry disruption. The revolutionary periods end with the start of another stable evolutionary period. The fifth dimension is the growth rate of the industry, which, like age and size, applies the proper context to an organization's trajectory.

The hypothetical example of charter schools can illustrate how these dimensions might look in the field of public management. Charter schools are independent public schools that operate under a (usually) 5-year contract with a school district or independent authorizing entity. The concept behind charter schools is funding for performance, meaning authorizers can cut off funding to schools that fail to meet performance targets. As such, charter schools experience high organizational turnover rates. Age, the first dimension identified by Greiner (1997), defines the different periods of a charter schools' existence. A new charter school is fighting for market share, attracting human capital, and developing organizational norms in its internal and external audience management practices. Older charter schools focus on maintaining market share, retaining human capital, and improving management practices. Similarly, a large school deals with a more complex internal bureaucracy and must apply more formal and layered management practices and structures and more complex human resource systems than a small school with limited staff.

In the charter school case, evolutionary periods would be characterized by the time between renewals of 5-year contracts. During those periods schools have a consistent set of goals and plans imposed by the contract between the organization and its authorizing entity. Each contract renewal would change the school's goals and systems, disrupting one evolutionary period and creating another. Finally, the level of competition from other schools, represented by charter school sector growth rate, would impact the behavior of the school and its leadership. In a highly competitive environment, charter schools may need to specialize to differentiate themselves and attract students. In a low competition environment, merely being a charter school may be enough to attract students.

Greiner (1997) also created a framework for mapping the trajectory of organizations, specifically concluding that all organizations traverse through five different phases during their life cycles. The first phase, creativity, is when a new organization is creating itself and establishing an identity through the implementation of its original management structure and processes. The second phase is direction, wherein an organization has established itself as a legitimate actor in the marketplace and must decide on, and implement, its growth plan. The third phase, delegation, assumes a growing complexity within the organization that

requires leadership to begin subdividing tasks and delegating authority among a system of department-level managers. Phase four, coordination, is when management masters the ability to coordinate delegated tasks between all layers of management. Finally, in the fifth and final collaboration phase, a mature organization begins to shed some of the bounds of structure and attempts to overcome the inefficiencies, trained incapacities, and general staleness characterized by what Merton (1957) called the pathologies of bureaucracy. The broad takeaway from Greiner's (1997) framework of dimensions and phases is twofold. First, context factors as size, age, and sector shape an organization's behavior in each phase of its life span. Second, organizations become more complex over their life spans.

Much of the literature inspired by the work of Boulding (1950) and Greiner (1997) focuses on the beginning and end of organizational life cycles. Lewis and Churchill (1983), for example, present a framework by which a new organization must overcome its liability of newness (see Stinchcombe 1965) before growing into a mature stable organization. Their five phases of organizational growth are existence, survival, success, takeoff, and finally resource maturity. Like Greiner's, Lewis and Churchill assume that organizational behaviors occur at different stages of an organizations' development. In contrast, Herbert Kaufman (1991) offers a critique of the dominant organizational life cycle literature, arguing that the success or failure of organizations is attributable to randomness. Kaufman concludes that organizations survive until they run out of resources and that organizations may run out of resources for any number of unpredictable reasons.

## How Can the Study of Organizational Life Cycles Be Applied?

Despite its origins in the business literature, the theory of organizational life cycles has frequently been used in the business, public, and nonprofit sectors to explain the actions of organizations. Delmar and Shane (2004), for example, explain how organizations take specific actions such as legal incorporation and completion of a business or strategic plan in order to create legitimacy in the eyes of internal and external stakeholders. Their basic argument is that legitimacy is a key factor in overcoming the liability of newness problem and that early-stage organizations generally take actions aimed at creating legitimacy in the eyes of stakeholders.

Lecy and Searing (2015) apply organizational life cycle theory to the nonprofit sector, concluding that young nonprofits are prone to underestimating their infrastructure expenses. Why? The pressure from donors and managers to demonstrate low overhead costs results in business and strategic planning that is divorced from organizational reality. To obtain resources organizations must appear efficient, but underestimating overhead costs could put the future of the organization in jeopardy. Hager, Galaskiewicz, and Larson (2004) also apply organizational life cycle theory to the nonprofit sector, but emphasize context by focusing on organizational growth in the single market of St. Paul, MN. Restricting their study to one sector in a single market allows them to account for the dimension of growth rate in an environment where study organizations face common challenges and serve similar customers.

Aldrich and Martinez (2001) use organization life cycle theory to explain how individual entrepreneurs shape their organizations at different times in the firm's development. As discussed, previous studies illustrate how contextual factors including age, time, and competition impact organizations in predictable ways; Aldrich and Martinez (2001) add entrepreneurial decision making as an additional contextual factor worthy of study. Finally, Ford (2011) applies organizational life cycle theory to explain the success or failure of nonprofits providing services traditionally provided by the government sector. Ford concludes that nonprofits highly dependent on government funding struggle to overcome their liability of newness in their first few years of operation.

All of the previously discussed applications demonstrate the explanatory and normative power of organizational life cycle theory. As the use of networks in public service delivery becomes more commonplace, there is value in

explaining how and why organizations are born, evolve, and die. Organizational life cycle theory also has normative value when used by policymakers to understand how successful organizations can be created, nurtured, and protected so as to address society's more wicked problems. Ford and Andersson (2016), for example, use the Milwaukee voucher school experience to explain how policies predicated on predictable organizational life cycles can be implemented to minimize the risk of a school failure. Generally, the theory can be applied to better understand the ecosystems of organizations providing publicly funded or subsidized services to citizens.

## Conclusion

Understanding the way in which government services are provided to citizens is impossibly without understanding the various actors that coordinate and deliver said services. Government itself is a vast network of organizations that collectively serve the public whom donate freedom and treasure to participate in a governed society. Yet, the way in which services are provided frequently changes. Government agencies are created, evolve, and sometimes are eliminated. The nonprofit organizations increasingly involved in publicly funded service delivery similarly are born, evolve, and die. Studying organizational life cycles allows both scholars and practitioners of public administration to better understand the common challenges faced by organizations over their life spans. Better understanding these life cycles can help policymakers and managers create stronger organizations that better serve the public.

# Organizational Pathology

Craig Boardman[1] and Branco Ponomariov[2]
[1]Center for Organization Research and Design, Phoenix, AZ, USA
[2]University of Texas, San Antonio, TX, USA

## Synonyms

Organizational disaster; Organizational disease

## Definition

Organizational pathology a broad concept that encompasses any internal aspect of the organization that is a threat to organizational survival. Specifically, the concept analogizes organizational differentiation to vital organs and systems thereof in a human, organizational formalization

to biologic systems like circulation and respiration, organizational centralization to the brain, strategic and operational planning to synaptic firing in the brain, appendages and orifices to resource-dependent ties to the external environment, and organizational culture to personality and mental health.

## Introduction

The diagnosis of organizational pathologies assumes the survival of the host organization as axiomatic, without critical reassessment of its purpose and social utility. An organization considered to be purposeless or even harmful can be entirely "healthy" or free of organizational pathologies, just as an organization with just purpose and high social utility can be plagued.

Another assumption of the concept of organizational pathology is that an internal aspect of the organization deemed as pathological must pose problems that are abnormally detrimental to organizational performance, meaning much more than the incremental impacts that normal workaday frictions and conflicts can have.

Organizational pathologies are either abnormally high levels of these normal frictions and conflicts or qualitatively unique phenomena not typically associated with the workaday functioning of the organization.

Accordingly, organizational pathology is one of the broadest concepts in organizational studies. It can be used to address any internal aspect of an organization that has become dysfunctional, counterproductive, inefficient, disruptive, and destabilizing, to extent that is "pathological." The reason for the conceptual broadness is that the organization-as-organism analogy likens organizations to the more complex array of mechanisms and processes that constitute a human organism.

It is our view that as a concept organizational pathology has not been sufficiently defined and therefore that it has not been reliably and validly applied in organizational studies (Ponomariov and Boardman 2010). To remedy what we see as the potential pathology of organizational pathology, that is if the concept becomes pathological by it broadening in popularity without improvement, we first elucidate the organization-as-organism analogy. Next we extend the analogy to the physician specializing in internal medicine, which is to say the scholar or student interested in organizational pathology, by presenting four axioms for understanding and managing organizational pathologies, responsibly.

### The Organization-as-Organism Analogy, Redux

The concept of organizational pathology analogizes the organization to a complex living system (e.g., a biologic organism) that is replete with a brain; other vital organs; circulatory, respiratory, and digestive systems for distributing and using resources; appendages and orifices for acquiring and consuming vital resources from the external environment; other appendages for avoiding predators in the external environment; non-vital organs like those for reproduction; and yet other orifices for excreting waste and other potential toxins. To elaborate:

- *Vital organs*. The vital organs are the vertically and horizontally differentiated subunits that fulfill the core function or functions of an organization. Vital organs or core subunits operate collectively as systems using the other two constructs for organizational structure: formalization and centralization. Formalization and centralization are within the purview of the brain, which is to say the management and leadership of the organization.
- *The brain*. Leadership and management do most of the strategic and operational decision-making for the organization. Leadership makes decisions to help the organization to avoid the best predators or competitors. Management makes decisions to ensure that vital resources are acquired from the external environment and allocated internally in such a way that the vital organs or core subunits of the organization coordinate and communicate effectively if not efficiently to produce whatever products or services the organization is designed to provide. The operational and strategic plans of

the organization the leaders and managers implement, respectively, constitute the synaptic wiring and firing of the organizational brain, and both types of plan can be altered by organizational learning.

- *Sustenance*. Oxygen, calories, nutrients, and so on are analogous to the resources the organization must acquire from the external environment that are vital to the fulfillment of the organization's core functions. Appendages like arms, hands, and legs are analogous to the individuals and/or core subunits within the organization who/that have direct ties to the individuals and/or organizations in the external environment who/that are in possession of said resources. Because of the fundamental importance of acquiring vital resources with certainty and reliability, the individuals and/or subunits in the organization who/that have direct ties to the external environment exercise the most power in internal organizational decision-making. Typically these powerful individuals and/or subunits in the organization reside toward the top of the organizational hierarchy, typically in the brains or executive subunit of the organizational organism, in positions of management and leadership.
- *Psychological factors*. The psychology of the organization is its organizational culture – one of the more diffuse concepts in organizational studies. Like human organisms, an organization's psychology or culture is much more difficult to observe empirically than are the other internal aspects of the organization. Organizational cultures typically become pathological due to multiple other pathologies occurring elsewhere in the organization – for example, in a particular subunit, in management and leadership – that go unaddressed or addressed but persist and remain unremedied nonetheless.
- *Non-vital organs*. Non-vital organs are the vertically and horizontally differentiated subunits that fulfill the noncore functions of the organization, which are the functions that may not contribute to organizational outcomes, at least not vitally or essentially so, or could be outsourced. Non-vital or noncore subunits typically operate separately from the core organs or vital subunits in the organization, and noncore subunits are usually situated lower in the organizational hierarchy when compared to core subunits, but this is not always the case. Noncore functions of course can vary greatly, depending on the industry or the public policy area or the public service mission of the organization. And what is a noncore function for one organization may be a core function for another organization. Sometimes it is more efficient for an organization to outsource its noncore functions, depending on the asset specificity of noncore functions and the ease with which the performance of these functions by contractors can be measured validly and reliably.

The broadness of the organization-as-organism analogy logically dictates that there can be no per se narrowing of the organizational pathology concept. All incarnations of all internal aspects of organizations can become pathological and begin to function in ways that detract from the meta-outcomes that most every organization seeks – organizational effectiveness, efficiency, and longevity or survival. This goes whether an internal aspect of the organization affects one or more of these meta-outcomes directly or whether the internal aspect affects one or more meta-outcome indirectly, for instance, via middle-range outcomes such as increased turnover, increased absenteeism, decreased organizational commitment, decreased worker motivation, decreased job satisfaction, delinquent suppliers, and so on.

## Diagnosing Organizational Pathologies, Validly and Reliably

The below list includes but a fraction of the organizational pathologies that are addressed in the organizational studies literatures:

- Leader-member exchanges that engender suspicion rather than trust
- Leadership that fails to provide guidance for difficult tasks

- Leadership that provides too much oversight for the investigation of complex problems
- Bureaucratic personalities that obfuscate collective and/or individual performance
- Formalization that fails to fulfill its intended function

Each of these examples specifies a deficiency or failing of one or more internal aspect of an organization and not a negative outcome or consequence per se. For example, though poor leader-member relations may lead to increased turnover and with this a loss of human capital and decreased market share or, in the case of a government agency, a failure to provide a particular public service to all members of the target population, employee turnover is not per se pathological. Rather, in this particular example, employee turnover is a symptom of organizational pathology, in this example the organizational pathology being "low" leader-member exchanges characterized by mistrust if not additional negative sentiments.

This brings us to the first axiom for the organizational pathologist:

**Axiom 1** The diagnosis of an organizational pathology must specify the internal aspect or aspects of the organization that are dysfunctional, disruptive, inefficient, ineffective, and/or destabilizing.

This task is difficult because the conceptual definition of organizational pathology by itself does not contain clearly defined guidelines for identifying the pathological component of an organization. Much like the medical meaning of pathology is applied to specific system being affected in an organism, applying the notion of pathology to organizations also requires identifying the particular systems afflicted by a pathology. The field of organizational studies has yet to produce reliable and valid decision rules for measuring one or another internal aspect of an organization in these ways, much less for setting benchmarks that indicate when a particular internal aspect of the organization – a particular subunit or procedure or manager or whatever – is "pathological" to the organization.

The second axiom is ancillary to the first axiom:

**Axiom 2** A study or investigation of an organizational pathology must specify one or more organizational pathologies as antecedent to, directly or indirectly, one or more of the meta-outcomes of the organization.

If a particular study does not address the extent to which a dysfunctional or disruptive or unstable subunit or rule or whatever is having a negative impact on the organization, it is not a study of organizational pathology per se. For a study of organizational pathology, the explanatory variable must be one or more internal aspects of the organization, and the dependent variable must be one or another measure of organizational performance, or at least an outcome that is logically related to organizational performance. In the biological analogy, usually a pathology in a particular organ is diagnosed on the basis of deterioration of the overall performance (health) of the organism. The symptoms trigger a search for the pathology in a specific subsystem or organ. Accordingly, the third axiom emphasizes the valid and reliable measurement (identification) of organizational pathology:

**Axiom 3** An internal aspect of the organization is pathological when it hinders or impedes organizational performance because it meets one of the first three and/or the fourth of the following criteria:

- It fails to fulfill its organizationally sanctioned function.
- It fulfills its organizationally sanctioned function, but in a diminished capacity.
- It fulfills its organizationally sanctioned function, but for too long.
- It fulfills a function that is not organizationally sanctioned.

The reasons for these failures can vary. One of the most common pathologies studied is organizational formalization gone awry, i.e., "red tape." Whereas the organizational red tape literature applies these decision rules exclusively to organizational rules and procedures, these criteria are equally applicable to all other internal aspects of

the organization, including the subunits performing core functions and those performing noncore functions, leadership and management, and even organizational culture.

## Remedying Organizational Pathologies, Responsibly

There are two general approaches for remedying organizational pathologies: organizational design and organizational development. The design approach emphasizes an organization's vital organs or core subunits, its extrinsic incentives for inducing worker contributions toward organizational goals, and/or its operational plan and managerial decision calculus. In the biological analogy, the equivalents would be surgery. In contrast, the development approach emphasizes the psychology or culture of an organization, its intrinsic incentives for inducing worker contributions toward organizational goals, its strategy, and/or leader-member relations. In the biological analogy, the equivalent would be therapy.

Accordingly, the organizational design and organizational development approaches prescribe related but distinct remedies for organizational pathologies. To elaborate:

- *Changing the worker, not the work or the context of work*. The organizational design approach to the worker generally promotes person-organization fit or the rank-in-position approach to the worker. Specifically by way of (i) training and development so employees can stay in their current subunit and position, (ii) relocating workers to subunits and/or positions for which their skillsets and cognitive abilities are a better match or fit, (iii) terminating workers for which there is limited to no person-organization fit, and/or (iv) hiring new employees for which there is good or at least better person-organization fit.
- *Changing the work, not the worker or the context of work*. The organizational development approach to the worker generally promotes the rank-in-person approach to the worker, meaning it promotes changing the work, not the worker, so that it can better satisfy the intrinsic motives of the worker. Specifically by way of (i) providing the worker with work that is challenging but not too challenging, yet also interesting; (ii) guiding workers through tasks and projects that are too difficult and/or intimidating for them to navigate alone; and (iii) empowering the worker by granting them enhanced decision-making authority over matters pertaining directly to their work.
- *Changing the context of work, not the work or worker*. Both the design and development approaches acknowledge that even when workers are positioned and motivated so that they can make sufficient or better contributions toward organizational goals, organizational pathologies can persist still. In such instances, the context in which an organization's workers must work becomes the change point. From the design perspective, this means restructuring an organization so that it better aligns worker behaviors with organizational goals – by way of a new or rearranged subunits and new or revisited extrinsic incentives. From the development perspective, changing the context of work too can mean restructuring, and it can additionally mean changing leadership approaches or leaders when there is a failure to change the work to workers' liking (see the above bullet), but rather to align the intrinsic (versus extrinsic) motives of workers with organizational goals.

The organizational design and organizational development approaches for remedying organizational pathologies are not mutually exclusive. In fact it is quite easy to find evidence of both approaches in the numerous case studies of dysfunctional organizations available on Electronic Hallway and Harvard Business School depositories. It is challenging to understand which remedy or remedies to pursue, if any, which brings us to our final axiom for the study of organizational pathologies, one that is aimed more at practitioners than academics:

**Axiom 4** Do no harm.

There are two ways an organizational pathologist can harm an organization.

- He or she could pick a remedy that fails to mitigate or even exacerbates a given pathology.
- Related, he or she could misapply or ignore the third axiom above by diagnosing an internal aspect of the organization as pathological when it is in fact not pathological.

Regarding the first way an organizational pathologist can do harm, we defer to the organizational change literature, which elaborates the organizational design and development approaches for remedying organizational pathologies and more broadly to the management science literature, which focuses on modeling organizational performance. As for the second way an organizational pathologist can do harm, we discuss two common misdiagnoses.

First, take the example of internal conflict in an organization. Though sometimes internal conflict can be disruptive and detract from organizational performance, some degree of conflict is inevitable in organized activity, and within a certain range it can be even beneficial, for instance, for generating innovative solutions to complex problems (Simon 1947), which is to suggest that too little as well as too much conflict can be pathological in organizational scenarios wherein organizational innovation is fundamental to organizational performance if not survival. In contrast, an organization whose core functions is to provide a basic product or service – think trash collection – internal conflict is undesirable, yet still not necessarily pathological. Internal conflict in such an organization would become pathological only in extreme cases, for instance, when workers strike.

Second, take the popular characterization of organizational rules and procedures as "red tape." Whereas all organizational rules and procedures involve a compliance burden, only those entailing a compliance burden without contributing to organizational goals are pathological (see Axioms 1 and 3 above). As Herbert Kaufman famously noted, one person's red tape is another's treasured procedural safeguard. An organizational pathologist should not be focused on reducing formalization for the sake of reducing formalization. He or she should advise against hasty interventions before accumulating sufficient evidence that a rule or procedure is indeed pathological and therefore red tape, no matter what the preferences of the client or other stakeholders.

## Conclusion

The concept of organizational pathology needs further development. Due to a lack of clear parameters and decision rules for applying the concept, it has been applied inconsistently throughout the organizational studies literature. Some studies of organizational pathology fail to use the concept altogether, whereas other studies use it despite there being nothing at all pathological about the unit of study. This problem is partly a function of the broadness of the organization-as-organism analogy and partly a function of the laziness of organization studies and management scholars. In this essay we have tried to make sense of the concept in such a way that brings some consistency to its application. Pending further development, we remain uncertain of the concept's value, to organizational scholarship and organizations. Indeed, the idea of organizational pathology itself may be pathological. The concept is susceptible to being used to further political agendas rather than those for the effective and efficient production of public and private goods and services. And not all organizational pathologies should be remedied – some organizations should be allowed to die of natural causes, be it by way of obsolescence or having been bested by a natural predator or competitor.

Organizational image

## Definition

Daniel Carpenter defined organizational reputation as "a set of beliefs about an organization's capacities, intentions, history, and mission that are embedded in a network of multiple audiences" (Carpenter 2010, 33).

## Introduction

Organizational reputations are impressions of organizations that stakeholders share based on their capacity, roles, policies, and obligations (Fombrun and Shanley 1990; Carpenter 2010). Organizations' accumulative pasts and prospective behaviors influence diverse affiliations to evaluate how attractive the organizations are (Carpenter 2001, 2010; Fombrun 1996, 2012; Post and Griffin 1997). It is important for organizations to maintain good reputations with multiple audiences, including politicians, interest groups, citizens, community, employees, and customers (Carpenter 2001; Post and Griffin 1997). It means that the audiences are willing to support the organization physically and emotionally.

Public agencies could gain political power through the reputations, which are based on the audiences' assessments of their behaviors. Bad reputations of public agencies indicate that audiences are unsatisfied with agencies' behavior. Good reputations mean that audiences favor what agencies do. When public agencies continuously obtain bad reputations, people would start to question about complying with the programs or the rules that are provided by the government. On the opposite side, if the organizations accumulate positive reputations, they gain political power to earn legitimacy for their current programs and future plans. In short, reputation could lead public organizations to behave desirably without strong control of regulations (Busuioc 2016).

This article focuses on why reputations of public agencies are important from the perspective of the relationships with their audiences, including citizens and politicians. Citizens are ultimate principals of public agencies. Politicians are principals of public agencies defined by the US Constitution. Reputations can help public agencies to improve the relationships with citizens and politicians. Also, this study suggests how reputations could benefit public agencies performing within network, which is a prevalent form of governance structure. It will show how government can utilize their reputations to interact with multiple actors within network structure. Overall, this article would suggest why we should seriously consider reputations of public agencies seriously.

## Reputation of Public Agencies in the Eyes of Citizens

Reputations of public agencies are important, because they reveal evaluations of citizens on government whether their desires are fulfilled or not. Citizens are ultimate principals that government should serve. Government should provide citizens safety, services, and solutions to their problems. Public agencies need signals to guide the directions that they should execute policies. It should reflect citizens' needs and desires. Reputations can give public agencies a sign whether their current behaviors are positively or negatively perceived by citizens. The effort of public agencies to maintain or earn good reputations could ultimately increase citizens' trust in government.

Trust in government implies that citizens feel their emotional needs are fulfilled by government. It is also an assessment of whether the behavior of government is in line with the public's normative

expectations (Berman 1997; Miller and Listhaug 1990). High trust gives a legitimacy to government and promotes citizens' compliance of rules and participation (Levi and Stoker 2000; Tolbert and Mossberger 2006). However, low trust in government shows citizens are doubtful about the possibility of their government being good within their relationship (Damon 1995; Barber 1983; Merton 1957). Distrust toward government comes from problems of government and its officials' integrity, purpose, and effectiveness (Starobin 1995; Durant 1995; Jurie 1988).

Improving reputations of public agencies can be a way to increase trust in government. While trust emphasized situational factors for relationships, reputation is a result of trustworthy behavior which engenders trust (Blois 1999; Hosmer 1995; Swift 2001). Government doesn't earn trust through command, because the judgements of people are based on their belief. It is a belief that behavior of government is and will be trustful based on their accumulated trustworthy behavior (Swift 2001). In other words, when government consistently shows trustful behaviors, they contribute to reputations for trustworthiness. It could ultimately increase trust in government. Managing reputation of government for good integrity, purpose, and effectiveness would be a key to restore the distrustful image of the government.

Also, reputations can measure diverse aspects of public agencies, which would help them strategically increase trust in government. Reputation calibrates how capable public agencies are by evaluating their performance, procedure, morality, and technique (Carpenter 2010). Multiple dimensions of reputation influence the reaction of constituencies and how the public officials behave (Carpenter and Krause 2012). These help public agencies to understand the true expectations of citizens and decide what reputations should prioritized. For example, agencies like NASA which deals with tasks that are technical and specialized could emphasize technical reputations (Carpenter and Krause 2012). The strategic decision of managing multiple reputations help to change the negative attitudes of citizens and restore the relationship between citizens and government.

## The Impact of Public Agencies' Reputations on Legislatures

Reputation can offer political power to public agencies in their relationships with legislatures. Throughout history, politicians had superior status over public agencies, and this hierarchical political system was taken for granted in democratic systems. The US Constitution assigned the legislative branch a power to make the laws, as well as create, fund, and empower the public agencies to implement the laws (Carpenter 2001). The founders believed citizens could reveal what they want through regular elections. Elections gave legislators the legitimacy to obtain power over executives. The founders worried about the executive branch to make a tyranny more likely, which would jeopardize liberty of citizens (Lowery 1993). As a result, the legislature was in charge of preventing the executives from abusing power. The accountability of public agencies was being responsive toward legislatures by executing the rules made by politicians (Friedrich 1940).

However, as the society became more complex and larger, legislatures became more detached from the citizens while their reliance on executives increased. The numbers of politicians were too little to deliver all the requests of the whole population. The politicians had limited resources to reach all the problems that citizens faced in their daily lives. Comparable to the legislature, public agencies delivered more services and programs to citizens as the government was getting bigger. As public administration's size increased, public agencies gained more personal and financial resources to reach to the diverse range of citizens while implementing the policies (Friedrich 1940; Behn 2001). As the citizens' connections with public agencies broadened, their reliance and expectation on public agencies also increased.

The public agencies had limitations when handling the citizens' problems directly, because they lacked legitimacy to make independent decisions. People who followed traditional views argued that the problems caused by societal changes should be solved by designing the rules more accurately and effectively, which meant strengthening

legislatures instead of giving executives political powers (Finer 1941). Public agencies had weak legitimacy to make decisions independently because of those people who didn't want confusion in the systems.

Reputation-conditioned autonomy was suggested to offer legitimacy to the executive branch's power to make independent decisions from legislatures (Carpenter 2001). Carpenter (2001) argued that executives could make decisions based on their preferences regardless of that of politicians when the public agencies developed reputations for expertise, efficiency, or moral protection. Those reputations could be bedrocks for public agencies to establish legitimacy for making decisions. It was earning trust from politicians and multiple audiences that allowed them to serve the jobs without monitoring in hierarchical systems. If legislatures were persuaded that public agencies could do the work properly, it would give the agencies the leverage to decide and behave independently. It transformed legislatures' hierarchical control toward public agencies' self-control.

## Reputation and Network

Reputation influences organizational behavior within networks where multiple organizations are interdependently involved (O'Toole 2014). Networks have been regarded as new form of governance in current society. Unlikely past government systems which emphasized hierarchical systems, networks stress the horizontal relationship among diverse actors, such as private organization, public agencies, interest groups, and the general public. This means that the responsibility, compliance, and punishment became less clear in the structure, but relationships among those actors became significant. Cooperation and reciprocity among actors are important results in successful policy outcome (Powell 1990; Moynihan 2012; Ingold and Leifeld 2016). Reputation can be one of the sources that can help to build up cooperation and lead to successful outcomes of network governance.

It is believed that reputation can maintain reciprocal relationships between actors, which are an important feature of network governance. Reputation for trustful behavior, such as keeping promises and good performance, would lead the actor to earn trust from other actors for being trustworthy. This series of processes help the actors willing to participate in "mutually productive social exchange" (Ostrom 2003, p. 13). On the other side, reputation for being untrustworthy can have a function as punishment, because other actors in network try not to engage with the actor. When there are not clear measurements for selecting or evaluating the participants within network, the balance can be maintained through reputations (Ingold and Leifeld 2016). Without strict orders or monitoring processes, participants could have incentives to follow norms in network and produce mutually beneficial results.

However, we have to keep in mind that reputations of public agencies can be a "double-edged sword" (Moynihan 2012, p. 571). It is because public agencies have complex relationships with multiple audiences, and they don't perceive the agencies in the same ways. Public agencies implement the rules that are decided by legislatures, while their ultimate goal is to serve the public well. This means that public agencies are sensitive toward blame and criticism for their outcomes of the service provided by network. Their political responsibilities toward politicians and citizens sometimes are more important than trust and reciprocity norms with actors in network. The problem arises especially when the responsibilities of actors within network are vague. As more power imbalances exist within a network and costs of blame from outside of network become critical, public agencies try to sacrifice the reputations with network members to protect their reputation from outside of network (Carpenter 2001; Moynihan 2012).

## Conclusion

This entry suggests the meaning of organizational reputation in public administration. Reputation implies an assessment of the organization constructed by multiple audiences. For private organizations, reputation is an important asset to

ultimately gain financial benefits by attracting more investment or selling more products. However, reputation for the public sector has different meanings, because the expectations of multiple audiences are different for public organizations. Citizens want the public agencies to serve them better as well as the programs to fulfill their desire related to diverse public values. When citizens perceive that public agencies are doing well, they have more positive views that the organizations are trustworthy. This can lead to an increase of trust in government and gain the support from the public, which are essential to successful policy outcomes. Also, within the relationships with politicians, executives can earn more autonomy by gaining more positive reputations about their ability to do the work by themselves. This would create more political power to public agencies. Lastly, reputation would become more important in current governance structures which are emphasized on network. When more emphasis was put on reciprocity and horizontal relationships, reputation would become more important to maintain and regulate the behavior in network to govern the process.

## Synonyms

Onboarding; Professional socialization; Socialization; Socialization tactics

## Definition

Organizational socialization is the process by which newcomers become effective organizational members.

## Introduction

Public sector organizations are largely assessed by their effectiveness and to a large extent their effectiveness relies on their most important asset – employees. As such, how to transition new employees into effective organizational members who are likely to serve the organization for a long time is a key concern for public sector managers. They may expend a great deal of effort and resources to bring new employees onboard through activities such as orientation, training, mentoring, buddy systems, and on-the-job training. These activities comprise formal organizational socialization tactics – the means by which an organization inculcates newcomers with the organizational culture and transforms them into full-fledged, effective organizational members (Van Maanen and Schein 1979). A great deal of literature in the general organizations and management literature has focused on organizational socialization. In public administration, most research on organizational socialization is relatively recent, although it is a growing area.

Public sector organizations face unique challenges that make socialization especially important and that influence how they onboard newcomers. First, changing environmental factors, such as budget cuts and public administration reforms, require public employees to respond rapidly and effectively to changing, multiple, and sometimes conflicting demands. Second, public agencies face unique challenges in recruiting and motivating employees. They are typically more constrained than private sector organizations in using monetary incentives to attract new agents and foster their motivation. Their often negative bureaucratic image can also make it more difficult to attract and recruit qualified job candidates. Third, public sector employees are often attracted to public organizations because of their interest in policy-making, their compassion for others, or their desire to serve the public interest. But the reality of public service may make it difficult for them to maintain those inspirations over time, and as their tenure increases, they may actually become less idealistic (Kjeldsen 2014). Hence, socialization is especially important for public sector organizations because it transmits organizational values and culture among newcomers, fosters their organizational commitment, communicates expected behaviors, and instills skills needed to become productive organizational members (Romzek 1990; Van Maanen and Schein 1979).

Organizational socialization, or onboarding, is the process by which newcomers become full-fledged, productive organizational members (Louis 1980; Van Maanen and Schein 1979). When newcomers join an organization and assume a new role, they experience entry shock or surprise as they make sense of their new roles, responsibilities, and organizational norms (Ashforth 2001; Louis 1980). They absorb as much organizational and task-related information as possible while at the same time they must simply learn how to fit in. New employees also must determine "who is who" within the organization in terms of roles, power, influence, and access to resources. As a result, they must sort

through a great deal of information, signals, and expectations in order to become functional employees who fit in well. As such, one key function of socialization is uncertainty reduction for new employees (Bauer et al. 2007). Organizational socialization efforts are also geared toward instilling organizational values, norms, and culture and transferring knowledge and information needed to perform effectively (Bauer et al. 1998; Louis 1980; Romzek 1990; Van Maanen and Schein 1979). This process involves activities for new employees where they are "given broad responsibilities and autonomy, entrusted with "privileged" information, included in informal networks, encouraged to represent the organization, and sought out for advice and counsel by others" (Louis 1980, p. 231). Organizational socialization is a learning process – newcomers must become proficient in and understand the norms, expectations, roles, and responsibilities that define their organizational membership (Ashforth et al. 2007).

Organizational socialization tactics are generally categorized as "institutionalized" or "individualized" (Jones 1986; Van Maanen and Schein 1979). With institutionalized socialization, organizations invite newcomers to think and behave according to preestablished roles, thus encouraging them to follow very structured processes. In sharp contrast, organizations relying on individualized socialization integrate newcomers more by default than by design and invite them to be innovative and to actively design their own role in their new organization. Van Maanen and Schein (1979, pp. 232–247) further developed a typology of six dichotomous socialization tactics that have been the basis of a great deal of organizational socialization research:

- *Collective* vs. *individual*: Whether newcomers are placed into groups and given common experiences or socialized individually
- *Formal* vs. *informal*: Whether newcomers are segregated from organizational members and given experiences specifically for newcomers
- *Sequential* vs. *random*: The degree to which newcomers must follow a specific set of steps leading to the final role
- *Fixed* vs. *variable*: The degree to which steps in the process are linked to a specific timetable
- *Serial* vs. *disjunctive*: Whether experienced members serve as role models for newcomers who will adopt similar roles
- *Investiture* vs. *divestiture*: The degree to which the socialization process confirms or disconfirms the newcomer's preexisting identity (Saks and Ashforth 1997a, b, p. 49).

Although a great deal of research has focused its attention on the organization's efforts to onboard new employees, newcomers are not necessarily passive participants in the socialization process. They may engage in their own proactive efforts to access organizational information and job knowledge, to obtain performance feedback, and to connect with experienced organizational members (Morrison 1993; Saks and Ashforth 1997a, b). Newcomers themselves also influence how and whether they absorb and internalize new information about their work and the organization (Ashforth et al. 2007). Through their proactivity, newcomers seek to further reduce the uncertainties related to their new responsibilities by accessing people and information that may not be available through the channels provided by formal socialization tactics (Ashford and Black 1996). New employees seek information about how well they are performing, the nature of their relationships with other organizational members, and what is actually expected of them (Bauer et al. 2007). Levels of proactivity among new employees can vary based on individual differences and contextual factors such as the organizational culture or managerial support (Crant 2000).

Several factors can affect how well newcomers obtain and make sense of new knowledge, the organizational culture, and norms and expectations. Socialization antecedents include factors at the individual and organizational level (Bauer et al. 2007; Fang et al. 2011; Hatmaker 2015). At the individual level, identity, personality traits, proactivity, relationship building, and preexisting identity, knowledge, values, and beliefs influence the socialization process and ultimately its outcomes. Organizational culture and structure and the type of socialization tactics employed can also

affect how well newcomers become adjusted to their new role and organization.

Organizational socialization has been associated with a variety of key organizational outcomes that are important for public sector organizations. These outcomes can be viewed as relatively proximal outcomes associated primarily with newcomer adjustment and distal outcomes that affect both the newcomer and the organization. Newcomer adjustment includes role clarity, self-efficacy, increased organizational knowledge, task mastery, a sense of belonging, and identification (Bauer et al. 2007; Fang et al. 2011). Longer-term outcomes include career success factors such as performance, satisfaction, advancement, job growth, organizational commitment, intentions to remain, and turnover (Bauer et al. 2007; Fang et al. 2011). One outcome that may be of particular concern to public sector managers and organizations is how well newcomers develop a public service identity as a result of the formal and information socialization activities (Hatmaker 2015).

## Public Administration Research on Organizational Socialization

Three mainstreams of public administration research on organizational socialization may be distinguished. First, fit studies examine whether selection, onboarding, training, mentoring or promotion practices, as well as job and organizational characteristics, allow newcomers to become productive members of organizations as expressed by their levels of loyalty and commitment, their intentions to stay/quit, their job satisfaction, their competence, their social integration, as well as the perceptions on, or contribution to, their roles and goals within the organization (for recent examples, see Bright 2010; Dougherty and Van Gelder 2015; Jaskyte 2005; Jaskyte and Lee 2009; Peng et al. 2015). The main message that results from this literature is that organizational participation does not mechanically lead to higher person-organization fit: such a fit depends on a diversity of organizational antecedents (e.g., socialization tactics) and individual antecedents (e.g., proactive behaviors).

Second, some research looks at the effect of organizational participation on the level of public service motivation (Perry 1996) of newcomers (even if this research does not specifically refer to the concept of organizational socialization). This research shows that pre-entry levels of public service motivation tend to decrease after organizational entry. At the same time, some studies demonstrate the unequal influence of organizational socialization processes on the different dimensions of public service motivation (e.g., Davis 2011; Perry 1997). Decreases in public service motivation are theoretically attributed to postentry discrepancies (or "reality shocks": Kjeldsen 2014; Kjeldsen and Jacobsen 2013) between reality and newcomers' pre-entry expectations toward their supervisor, coworkers, and clients. Such decreases are reduced by some socialization antecedents, such as the importance attached by newcomers' colleagues to public values (Vandenabeele 2011) or "high commitment human resources practices" (Gould-Williams et al. 2014). Hence, organizations making special efforts to foster levels of public service motivation among their employees are able to temper the effects of discrepancies between newcomers' expectations and reality.

Third, several studies look at the constructivist process inducing "Eurocrats" such as European officials and state representatives into the norms and rules of supranational institutions (Checkel 2005). Eurocrats, this literature notices, learn about each other's beliefs and interests through their interactions. This process of "supranational socialization" influences Eurocrats' preferences on policies and in politics with an ultimate impact on supranational decisions and integration (e.g., Beyers 2010; Murdoch and Geys 2012; Suvarierol et al. 2013). Overall, this literature suggests that the importance of supranational socialization should not be exaggerated, especially when compared to more structural factors such as the Eurocrats' national affiliation of origin Quaglia et al. (2008) suggest that Eurocrats are multifaceted, becoming European in values but remaining attached to their national interests of origin.

The last category of studies is more heterogeneous. For example, Oberfield (2014) examines the effect of informal socialization influences (e.g., interactions with other newcomers and with veteran organizational members) and formal socialization tactics (e.g., training) on police officers' rule-following attitudes, use of force, as well as "service-oriented motivations" (e.g., "keeping order in the streets") and "self-interested motivations" (e.g., "getting a respected job"). He finds that, despite those influences, pre-entry attitudes and motivations are likely to remain the strongest predictors of postentry attitudes and motivations after some months or years of service. Van Kleef (2016) has also pinpointed the decisive influence of pre-entry norms, values, and attitudes of newcomers on their organizational socialization. Several other studies relate differences in organizational socialization processes with differences in public spending preferences of members from different organizations (Dolan 2002), in the perceptions of corruption of the elite and the public (Jackson and Smith 1996) or in the respective interests of elected officials and civil servants (Collins 1985).

Theoretically speaking, public administration studies use socialization effects to understand employees' perceptions, attitudes, and behaviors in two ways. A first category of studies contrasts socialization effects with other effects explaining homogeneity such as selection effects – public employees from the same organization being more homogenous in their attitudes and behaviors, not because the organization has transformed them, but because they were already similar when entering the organization. A second category of studies compares socialization effects with theories accounting for heterogeneity in organizational members' attitudes and behaviors. Typical of this category are European socialization scholars, who examine cases in which organizational socialization could overcome differences among Eurocrats resulting from diverging national interests. This is also typical of scholars comparing the homogenizing effect of organizational socialization and the effect of "representative bureaucracy," accounting for heterogeneity through the tendency of bureaucrats from different origins to "press for the interests and desires of those whom he is presumed to represent" (e.g., an ethnic minority or men/women: Bradbury and Kellough 2011, p. 158; Dolan 2002; Wilkins and Williams 2008, 2009).

## Agenda for Future Research

Despite the extant research on organizational socialization within the general organizations and management literature and the nascent research within public sector scholarship, there remain several avenues for future research. Public administration research could give more attention to informal socialization processes. Most studies remain focused on formal practices or patterns of organizational socialization, such as organizational tactics, trainings, mentoring, etc. Future research efforts could also be concentrated on informal socialization practices in additional to the formal tactics. This entails looking at employees' informal conversations during lunch or coffee breaks and analyzing the stories they tell each other. Doing so requires the use of more inductive and interpretive approaches, such as narrative inquiry, ethnography, and participant observation.

More research could also examine the process of socialization rather than focusing on outcomes. Doing so means going beyond quantitative data to collect qualitative data that can reveal the underlying dynamics of the socialization process. To analyze socialization as a process, longitudinal data is also required. Although there is some use of longitudinal data in socialization studies, an increase in the examination of socialization tactics and employee behaviors over time is needed. Future studies could examine the processes allowing newcomers to become similar to existing organizational members, as well as those that foster their creativity and divergence from the organizational norm. To the extent that new employees bring new perspectives and ways of doing things into an organization, future research may wish to examine a perhaps unintended part of the socialization process – how newcomers may change the organization at the same time they are

learning and adopting organizational ways of thinking and acting.

More comparative research is needed to specifically assess the differences and similarities of socialization in different contexts. Socialization research is scattered across disciplines and subfields such as PSM, street-level bureaucracy, and European socialization. These fields draw on similar theories, but are fairly isolated from each other. Comparing different contexts could further contribute to the development of socialization theories.

Public administration research could expand its focus on socialization antecedents that may be specific to the public sector at both the organizational and individual level. Public sector organizational culture, structure, and goals may differently influence socialization than those of the private sector. For example, to the extent that public sector may be more routinized and rule-based, offering employees less discretion, its structure, and processes may uniquely influence socialization and specific outcomes, such as employee innovation.

Future studies could also expand our understanding of newcomer proactivity and relationship building. In particular, the examination of newcomer social networks and how they change over time could lend more insight into informal socialization processes and their effects on socialization outcomes (Fang et al. 2011; Hatmaker 2015). Individual proactivity can influence to whom newcomers connect, and these connections can offer important organizational knowledge, job information, social capital, and other resources. Access to key organizational insiders may affect how quickly and the extent to which they become full-fledged organizational members. Peer-to-peer relationships can influence new employees develop a sense of belonging within the organization.

## Conclusion

A better understanding of organizational socialization processes taking place in public organizations is more important than ever. In such organizations, employees face increasing pressure to deal reach ambitious objectives with limited means. An understanding of how public managers can make their newcomers effective but at the same time innovative, motivated, and committed to the organization can be crucial to long-term organizational performance and survival.

# Organizational Structure and Crisis Management

Mahauganee Shaw and Shane Fudge
Miami University, Oxford, OH, USA

## Synonyms

Crisis-prone versus crisis-ready organizations; Organizational destabilization and restabilization; Managing organizational disequilibrium

## Definition

Organizational structure refers to the coordination of positions, operational procedures, and strategies within an organization. Organizational structure can also commonly refer to the system of task and authority relationships that assist an

organization's staff in maintaining coordination and control over their actions, while contributing to the achievement of common goals and objectives. Crisis management is the process of preparing for, mitigating, responding to, recovering from, and learning from emergency incidents. Crisis management can also be defined as the managerial functions and practices that attempt to expand upon strategies needed in times of emergency by involving a proactive perspective to risk assessment.

Organizational crisis can be defined as a scenario that is highly improbable, yet highly consequential, to an organization and its stakeholders. It has arisen due to the occurrence of a series of seemingly inconsequential, disconnected singular emergency events interacting in a chaotic (or nonlinear) fashion and resulting in an exponential growth pattern of negative consequences. These outcomes are highly devastating to the organization and its employees at both the functional organizational level and the personal-coping level. Organizational crises often result in alterations to the organizational structure; some revisions to organizational structure during crisis management are temporary and others can be permanent. Organizational crises leave behind a reduced capacity and sense of resilience in both the organization's technical and human systems. While crises are often viewed as bringing only negative consequences, theorists have noted the opportunity organizational crises bring for unique learning.

## Introduction

Within organizations, the manner in which employees approach and complete their work is usually highly structured. People know exactly where their position fits within the organizational structure and how their responsibilities interact with the work responsibilities of their colleagues in order to achieve the desired outcomes. While structure is useful in helping people to visualize the overall organizational functions and objectives, it can be thrown into disarray by an organizational crisis. When organizational crises occur, the organizational structure needs to be pliable enough to respond. The sections that follow describe various elements of both organizational structure and crisis management, as well as how they are interact throughout the crisis management process.

## Organizational Structure

Organizational structure refers to the systems of operation that organize a group's work, including positional levels and titles, policies and procedures, and strategies. *Positional levels and titles* refer to ranks within the organization. Often depicted on organizational charts – visual maps of how positions are structured within an organization, portraying both reporting lines and the vertical and lateral coordination of people and functions – position levels are usually arranged hierarchically with upper management positions at the top of the chart scaffolding down to lower level organizational members at the bottom of the chart. The people at the bottom of the chart are typically in front line positions that interact most with organizational clients while those at the top are responsible for overseeing daily operations, networking on behalf of the organization, and making leadership decisions. Positioning on the chart often aligns with one's pay grade, level of power and influence, and amount of responsibility within the organization.

The organizational chart also shows signs of other indicators of how positions are organized and how work flows throughout an organization; these indicators include vertical complexity and specialization of functions. Every organization will have a certain amount of *vertical complexity*, or a lack thereof. This type of complexity is evidenced by the number of levels that exist between the top and bottom levels of the organization; more levels equate to more vertical complexity (Daft 2010; Jones 2010). The formal position-authority dyad that exists between various levels of employees will be directly affected by the amount of vertical complexity found within an organization. *Specialization* refers to the division of labor and the amount of delegation present across all levels of the organization (Daft 2010). Quite often, organizational charts may be

organized according to the specialized functions that certain groups of employees perform. When there is a high amount of both specialization and complexity, an organization operates in a more centralized manner, where communication flows up and down the vertical levels, but communication across specialized areas is designated for those at the top levels. In contrast, flat organizations – those with little vertical complexity – operate in a more decentralized manner, where communication easily flows across the organization.

An organizational crisis will often require the free-flow of communication across many vertical levels and specialized functional areas that normally would more strictly contain communication within reporting lines. Having multiple layers of vertical complexity and specialization can create issues when it comes time to communicate across boundary lines in a crisis context (Mitroff 2004). Lower level employees are often not comfortable with the idea of communicating outside the normally structured lines of authority, for fear of reprisal. Furthermore, employees in different specialized functions may be unfamiliar with colleagues in other specialized areas and completely unaware of what resources exist within those areas (Coombs and Holladay 2012).

The second system of operation that contributes to organizational structure, *policies and procedures*, refers to the formal rules and regulations governing how people function within the organization (Daft 2010). Every organization has its own unique set of policies and procedures that regulate how people approach their daily tasks and achieve the goals of their positions. While some operational procedures of organizations are federally regulated, many procedures and policies are based solely on the operational needs and preferences of the specific organizational context in which they exist. In concert with these formal elements to structure, an organization will always have an informal dimension to its policies and procedures to consider. Informal dimensions relate to the ways in which the employees of the organization interact with each other on a personal level as they navigate their way through the official guidelines of the policies that govern their tasks (Jones 2010). Employees will learn through direct interaction with each other that certain individuals communicate best in certain ways or over certain topics, regardless of what the policy has written about how that function or task should be handled. Employees naturally adjust their behaviors with one another to accommodate personalities and this is in direct response to the desire to create the most efficient patterns of work. These informal dimensions of interaction across the structure will contribute to the organizational culture of a workplace and can have significant impacts on the mitigation or resolution of a crisis event (Mitroff 2004).

The final system of operation, *strategies*, refers to the processes and technologies used to achieve the work of the organization. While strategies can be mandated by policy and procedure, it is separate from that category. Strategies include the forms, communication systems, databases, software, and technological instruments that organizational members use to store data, share information, and perform the duties and responsibilities of their positions. Strategies are essential to maintaining organizational vitality as they dictate the direct action steps an organization is going to undertake to remain competitive in their marketplace or niche (Porter 2008).

As an organization ages, strategies are essential tools in the development and refinement of an organization's structure. This is because strategies contribute to the adjustment of an organization's goals, objectives, and mission. The strategy is a key element of the plans that various management and/or leadership figures create to keep all employees aware of the congruence between the three systems of operation within an organization. Strategies help everyone in the organization understand the steps that will be taken to maintain a competitive edge over other industry players. From an internal perspective, strategy can help organizational members learn and understand what they should be doing in certain scenarios or contingencies that arise over time (Porter 2008).

Strategy creation can be of immense help to an organization that may have to manage a crisis at some point in the future. Crisis management strategies are designed to deal with change, which is

an essential construct to understand if one is to successfully navigate the postcrisis environment. Such strategies also help organizations to clearly identify who they need to partner with in various situations to achieve their objectives. Developing a crisis management strategy creates the need to outline exactly how resources will be allocated in each contingency considered. This also allows for milestones to be identified. In the process of dealing with any issue, understanding progress as an achievement of a milestone can keep the employees involved motivated and feeling a sense of accomplishment, facilitated by the evidence of the plan actually working.

Together, these three systems of operation – position levels and titles, policies and procedures, and strategies – combine to create a structure that binds and directs life within an organization. As long as an organization is operating normally, this structure helps to sustain organizational operations by defining levels of authority and ensuring consistency in operations.

## Crisis Management and Organizational Structure

An organizational crisis is any incident that disrupts organizational operations and mission and threatens the safety of people, property, reputation, or financial status (Zdziarski 2006). It can encompass any event that is viewed as both personally and/or organizationally catastrophic. Crises can occur from within or without an organization and can be directly or indirectly linked to their marketplace or consumer base. Organizational crises differ from a general crisis in a key area, namely, organizational crises are specific, unexpected, and nonroutine events or series of events that create high levels of uncertainty and threat or perceived threat to a single organization's high priority goals (Seeger et al. 1998); this is a specific threat/urgency/uncertainty relationship that a crisis event has with the organization and its mandate.

A general crisis will not contain itself to the perspective or parameters of a specific organization. An important distinction must also be made between a crisis and any other type of risk or emergency – the loss of trust by those who witness it and in those who managed it (Pearson and Clair 1998). An emergency should be easily handled, in most contexts, by those who are trained to do so, because they are trained to monitor issues that pose risk. A crisis is significantly different in that it involves a deep psychological component on the part of those involved. The level of consequence of a crisis is so high and so devastating that people usually ignore its eventuality as a reality. People are cognitively limited in their ability to perceive potential risk escalating to that level (Mitroff 2004).

In short, they cannot reconcile their thoughts of "this is happening to us, it *seems* impossible." The outcome of this disbelief playing out across a gathered, collective psyche, such as that in an organization's staff is a loss of trust in the abilities of the leadership responsible for them. The inability of leaders to foresee the crisis and then to act accordingly while it was happening, creates this loss of trust, and elevates crises to another level.

The current gun-control issue in the United States is a developing example of what can be viewed as an organizational crisis that will affect the Government as an organization negatively as it unfolds. The population looks to the government for leadership and safe-keeping of their values. The lack of legislation on controlling access to high-powered weapons by any individual, no matter their intentions, creates a scenario in which the possibility for mass-shootings will increase. The occurrence of a mass-shooting in anyone's local area seems so devastating and also, *so unlikely*, that it prevents action steps that precede a mass shooting.

In response to this inability to correctly perceive the actual *high likelihood* that a shooting will occur eventually, there exists a lack of legislative change, due to a lack of urgency within any significant level of government authority. This leads to the eventual occurrence of mass-shootings, which have escalated in severity and casualties as the access issue has continued to go unaddressed or have limitations applied. This inability of the government to create necessary change leads to a loss of trust in their abilities to get anything constructive done about the issue in

the eyes of the public and voters. A further division of the public trust in the efficacy of the government is now exacerbated by this ongoing issue where no shifts in policy or structure seem possible. This will lead to an organizational crisis for the sitting President as no one will believe in their abilities to get something done on the issue.

The crisis management process cycles through five stages: planning, prevention/mitigation, response, recovery, and learning. The occurrence of a crisis immediately places an organization into the response stage of this cycle. Response includes the steps taken in the immediate aftermath of a crisis to contain the diffusion of damage throughout the organization and to ensure the continuity of normal organizational operations. Once this stage is complete, organizations enter a period of recovery, which is the long-term process to return organizational operations to a normal sate.

When an organizational crisis occurs, it destabilizes the organizational structure, thus allowing for shifts in authority and operations. This alters communication pathways and can provide opportunities for the *informal dimensions* of structure, to become valuable gateways for important information to get to the appropriate receiver quickly. An organizational crisis will challenge the belief structures that are in place, and employees will rely on each other as they observe what they perceive to be a failure of policy and procedure. Crisis management is the process of responding to this disruption of organizational structure – position levels and titles, policies and procedures, and strategies – in a manner that allows for continuity in organizational operations during disruption and an eventual restabilization of the organizational structure. An emergency shifts the organizational structure from one that focuses on the primary goal of achieving the organizational mission to one that focuses on the primary goal of ensuring damage containment and business continuity. This shift in focus causes subsequent shifts in organizational structure, some which are temporary and others which are permanent.

**Temporary Shifts** Temporary shifts are likely to occur most immediately; these include higher levels of authority being afforded to people on the lower levels of the organizational chart and a move from participative to directive decision making. These shifts happen because of how a crisis changes the context of the organizational environment. In the immediate aftermath of a crisis, organizational members are catapulted instantly into response mode. When responding to an emergency incident, there is seldom time to follow the normal chain of commands and authority. As well, organizational information and knowledge is stored at varying levels within the organization. Given that there is an immediate need to respond, the people who hold that knowledge and information need to have the authority to act on it regardless of their positioning within the organizational structure. Thus, preexisting position levels and titles, as well as policies and procedures, are rendered irrelevant.

This same reasoning explains the shift from participative to directive decision making. Participative decision making is more decentralized and inclusive. Planned change processes in an organization are usually participative. They are individually empowering, as they involve employees in the process of planning and implementing change, thus building organizational ownership from the lowest levels. Participative processes can lessen resistance to the final decisions and changes that are made within an organization. While assuaging resistance is desirable, crises often do not allow for universal inclusion in the decision making process. Any effort to increase the collective efficacy, or the belief in a group's ability to achieve goals, can be exacerbated in this context. However, if a group has a strong structure and informal dimensions that rely on high degrees of trust, employee morale can remain intact while also achieving a successful crisis management process.

In contrast, directive decision making is centralized and does not allow for the input of multiple organizational members. In the immediate aftermath of a crisis, when change is imposed on an organization, organizational leaders – those with the authoritative power granted to those at the top of the organizational chart – are likely to

use directive decision making in responding to that crisis and the changes it brings. The sense of urgency that crisis introduces to an organizational environment displaces, out of necessity, any previous culture of participative decision making. The aforementioned loss of trust and resilience in the workforce can also be triggered by this shift in decision making. If the ability to respond in ways that are personally meaningful is taken away from them, staff members will begin to resent the centralized approach taken by management. A centralized authority over decisions can make quick adjustments in the face of a crisis, but may overlook the specific details of how employees in particular functional areas are impacted by those leadership decisions and adjustments. Thus, centralized decisions may not adequately address all areas considered necessary by staff.

One caveat is that anecdotal accounts of crisis management usually present sentiments of organizational loyalty and the sense of camaraderie as heightened after a crisis. Thus, in the wake of an organizational crisis, when organizational loyalty is high, it may be possible to reframe directive changes as participative – making organizational members feel as if their acceptance of organizational changes is representative of their support for a swift recovery period. During the recovery stage, an organization that typically has a culture of participative decision making is likely to return to that style of operation.

**Permanent Shifts** Permanent shifts in organizational structure result from crises that carry extensive damage: disasters and catastrophes. While there are multiple levels of crises, these two categories are used to describe large-scale emergencies (Quarantelli 2006). A crisis is considered a disaster when it impacts not only an organization but the community or environment surrounding the organization. A catastrophe is a crisis that is qualitatively larger than a disaster with an impact that is deeper and more severe. When an organization experiences either a disaster or a catastrophe, the environmental context of the organization is deeply impacted, thus forcing shifts in the organizational context as well. While these shifts are permanent, they usually are implemented over an extended period of time as the organization recovers from the crisis.

## Conclusion

Crisis management is a process that requires leaders to strike the delicate balance between what is necessary to achieve organizational objectives and what is necessary to retain and organize employees throughout a period of crisis operations. The task of crisis management is further complicated by the increasing complexity of the technological, personal, and managerial systems we find throughout modern society. As the complexity of projects increases, the amount and type of potential crisis increases – be it general or organizational in nature. While there are multiple ways to view organizational structure, including any of the three systems of operation or other structural characteristics described above, each of these may be impacted by the threat or onset of a crisis. In order to enact a successful crisis response, organizational leaders must be attuned to how crisis can and does influence organizational structure. A strong organizational response will be based around a solid foundation of structure that encompasses the strengths of a well-built crisis management system. Namely, they will have considered all levels of employee response and mitigation, not just the top-tier. They will have considered the complexity of the project and its formal dimensions, while also considering the informal dimensions of their structure. When the crisis in question challenges their ability and resilience, they will lean on the informal dimensions of their culture to bolster the performance and ability of the organizational structure to respond as required. In the end, a more efficient structure will be created and recognized as a strategic tool for the organization's forward progress from any crisis event.

# Organizational Technology

Barbara L. Neuby
Department of Political Science and International Affairs, Kennesaw State University, Kennesaw, GA, USA

## Synonyms

E-government; Innovation; Interoperability; Strategic management; Technology

## Definition

Organizational technology is the sum total of man-made contrivances or developed processes that alter, refine, or create new goods and services delivered by organizations. It includes electronics, software, documents, new techniques, or any combination thereof used in the delivery of services.

## Introduction

Few would argue that technology has revolutionized the world and has been a driving force for societal and organizational expansion. Organizations, whether public, private, or nonprofit, provide us with the essentials of life on a daily basis. Food, housing, security, health care, machinery, vehicles, fuels, clothing, and defense are all produced by highly developed processes and all within organizations. No organization adopts technology in order to do less. Technology and specialized processes inform the hierarchy and workflow, create the product, form the image, manage the personnel, and sometimes become the organization themselves.

In early recorded time it was the development of a counting apparatus or a way to communicate between remote outposts. Maybe it was a better way to store food or wealth. The printing press, telegraph, and telephone, now cell phones, opened new lines of communication. Cars, planes, and trains moved us into new territory. With advanced electronics came unraveling of DNA. Truly wonderful advances fill us with the wonder of potential as we ask what lay in the years ahead.

Scholarly literature about technology in organizations predominates around information and communication technology, or, "ICT." Commonly known uses of technology in organizations also include database management, e-government, social media, and geographic information systems, or GIS, as well as more mundane uses like word processing and spreadsheet analysis. In addition there are other, lesser known applications such as frequency and biochemical applications, surveillance, and geoengineering. In today's organization

technology is ubiquitous and has shown to improve organizational performance and promote efficiency and effectiveness and organizational learning. Yet, challenges are evident in its application: cost, implementation, support, and privacy are a few examples.

The definition of technology is illustrative. The *American Heritage Dictionary* defines technology as "the application of science to industrial and commercial objectives" or "the entire body of methods and materials used to achieve such objectives" (1991). *Webster's Dictionary*, online, offers "the use of science in industry, engineering, etc., to invent useful things or to solve problems" and "a machine, piece of equipment, method, etc., that is created by technology." A differentiation is thus made between what actual devices, machine to do work, and the adaptations organizations have made to solve problems. Technology is thus broader than hardware alone and must include soft, or adaptive, methods, those intimately specific methods and techniques developed to suit some particular organizational purpose. How both hard and soft technologies operate within the organization and the impact they have on it and on society in turn is the subject of this chapter.

## Revolutions

### Computers

The desktop computer is still the number one office machine, despite the advent of more mobile electronics. Nearly every modern organization uses some variety of desktop hardware primarily for purposes of document and data management (Center for Digital Government 2015). Mundane but essential, word processing and database software manage vast amounts of documentation needed by most organizations. The efficiency of the fastest typist pales in comparison to the power of document software. Letters, invoices, forms, and even business cards are all easily and professionally produced within a few minutes. Spreadsheet software employs embedded formulas to extract meaningful information from reams of data saving weeks and months of hand calculations and with better accuracy. We can now telework from home. Database management for large public and private entities operate license systems, benefit applications, school records, public program data, building permits, taxes, personnel data, volunteer lists, profit and loss statements, budget data, and meeting minutes, all stored in huge electronic caches accessible in seconds with a click of the fingers. Local area networks (LAN) enable organizations to operate a private intranet, and enterprise resource management technology runs multinational organizations, public and private alike. Data once stored on paper in filing cabinets is now magnetized bits of charge on vinyl or stored somewhere in "the cloud" (Mergel and Bretschneider 2013). The power of computers and the cloud has also brought "Big Data," or, the broad and deep collections of public information that allow us to see a larger picture and compare performance of public programs. Big Data's advances inform policy maker's ability to analyze and disseminate this information and are transforming the policy process (Lavertu 2015).

Communications are also a major use of desktop and mobile computing devices. Face-to-face or phone conversations are replaced by email to those in the office next door or across the globe – the messages arrive at about the same time. For better or worse, we send office documents and quarterly reports alongside pictures of our pets and our children's weddings. There is virtually nothing that cannot be emailed across the world from one organization to another. Email has truly revolutionized the way organizations communicate. The same might be said for cell phones (mini-computers in and of themselves), Skype, texting, and voice over internet protocol (VOIP) calling that operate alongside a seemingly anachronistic yet persistent landline phone. Saving travel time and money, Skype is a virtual conference room, bringing organizations half a world away together in real time.

### The Internet

There are few words to describe the full nature of organizational changes wrought by the Internet, but one may suspect that, in the 1950s when ENIAC was created and again in 1969 when "ARPANET" was created, few understood their

true meaning. Designed as a way for scientists and the war planners to conduct research and to securely communicate, these tools were too powerful to be kept under wraps (Cortada 2014).

For governments and nonprofits, the Internet represents a vast opportunity but also challenges. Nonprofit organizations are the latest adopters: 98% of charitable organizations are networked for office processes, grant searches, a hunt for competitors and strategies, and basic information (Hackler and Saxton 2007). The Internet is now nonprofits' primary marketing tool through the use of social media that has increased their ability to attract donations and volunteers and to generate awareness of their mission. The virtual has replaced the actual in much of the nonprofit world, and this office is always open to potential clients. Internet use in nonprofits increases when the leaders support it, an implementation plan and funding exist, and there is no ambiguity about its purpose (Hackler and Saxton 2007).

Government offices use the Internet in myriad ways as shown in Table 1.

## Social Media

Social media plays a part in most of the above-listed uses as it blends user access with public service. It is an evolution of the technology revolution. Based on Web 2.0 architecture, social media systems provide for user generated content to be shared across all those on the platform. Social media is more than a communication channel; it is an interactive tool through which exchange occurs. Whether that marketer is in a private business, an animal rights organization, or a government agency, social media is a low-cost office space, open 24/7/365 with low maintenance and no health insurance (Mergel and Bretschneider 2013). For both nonprofits and government, social media and e-government initiatives bring awareness, education of one's organization, and public goodwill and have dramatically changed the way organizations operate (Leonardi et al. 2013).

## E-Government

All US federal, state, and most local governments maintain a website through which citizens interact with government whether on a social media platform or individually. Governments are leveraging their e-government platforms to promote economic growth and interoperability between agencies and programs. Seventy percent of state governments use social media to engage the public (Center for Digital Government 2015). Governments can spotlight favored programs; call attention to community issues; collect taxes, utility bills, and fines; manage job platforms; and receive bids for government contracts (Landsbergen and Wolken 2001). The public feels it is important for government to provide this information (Pew Foundation 2009) and is more positively disposed toward government for doing so (Dawes 2008). A survey by the Pew Research Foundation found that 61% of the American public has used a government website in some way: to access forms (41%), find policy information (48%), renew a license or vehicle registration (33%), apply for a government job (19%), or pay a fine (15%) (Smith 2010). In turn, governments accumulate data on public use

**Organizational Technology, Table 1** Technology uses in US federal, state, and municipal governments

| Municipal | State | Federal |
|---|---|---|
| Service delivery | E-government education and payment | Information management |
| Social media and blogs | Customer service and feedback | Surveys about website |
| E-government – payments | Consumer protection | Public education and awareness |
| Homeland security | Telecom regulation – cable, phone | Intelligence and analysis |
| Information sharing | Telemarketing regulation | Inter-agency communication |
| Public safety | Electronic commerce | Procurement |
| Emergency management | Homeland security | |
| Public education | Emergency management | |

Source: The Center for Digital Government. www.govtech.com

and use that data to improve public programs (Li and Feeny 2014).

In a survey by the Center for Digital Government, government leaders at all three levels stated their continued focus will include cybersecurity, transparency and open data, mobile applications, advancing their e-government portals, and cloud computing (2015). Sixty-nine percent of municipal governments are engaged in geospatial mapping (GIS) to assist with land-use planning and law enforcement. CompStat and CityStat are two examples of how local governments (New York and Baltimore, MD) make use of Big Data and GIS systems to make zoning and community policing more effective. Local governments are also employing the Internet and database systems for benchmarking, managing personnel, processing transactions, and sharing information with other governments. Suffice it to say that state legislatures are working on the policy aspects of technology implications and the legal forums are in their infancy of building case law (Dawes 2008).

## Important but Unconsidered Applications

### Global Grid and Military Systems

As of 2016, the US Department of Defense (DOD) and allied partners are creating perhaps the "next big thing" in computer networking with their Global Information Grid (GIG) project. The GIG will integrate computer networks across thousands of processes and servers around the world, and, while it is too soon to project the future of this amazing task, like the ENIAC and ARPANET before it, it is safe to assert that major changes in information sharing across organizational sectors will occur (National Security Agency 2015). For now, military organizations must make dramatic changes to their culture, strategy, and operations through use of this information architecture that is changing unit interoperability, deployments, and command and control hierarchies. Today's military organizations run on and survive via high-quality, well-managed technology. Satellites, encrypted radio communications, lasers, drones, robotics, and now warfighter physiological sensing have revolutionized the way conflicts, large or small, are conducted, and, eventually, all of this information and capacity will be embedded in the GIG. Much of it has already spread to state and local governments. Police forces now use drones and multiple surveillance tools, cities use robots in sewers, and most use encrypted communications. While it may seem inappropriate to include same here, it should be realized that much of the technology in use by governments today for peaceful purposes came out of military development from public agencies like the Defense Advanced Research Projects Agency, DARPA.

### Surveillance

Surveillance hardware and software is now in use by every large nation state and city. Communication satellites surveil the globe's emails, conversation, text messages, and web searches nearly in constant collection of bulk data. Privacy concerns aside, advanced photography can put an eye anywhere one wants it, and municipal governments worldwide have made the electronic photography industry rich. Millions of cameras dot light poles in every major city and together with GIS mapping have caused law enforcement to remodel its operations (Urban Institute 2011). Bulk data informs our security agencies and allows business to market potential customers but raises questions about privacy and security.

### Applied Biophysical Concepts

Organizational literature focuses on ICT, but the government's role in promoting other technologies has changed and will change society's public and private organizations in huge ways that must be considered for any review of organizational technology. It is often the case that inventions and developments come from or are chiefly promoted by the public realm and are then transferred to the private sector. A few will be discussed here.

### DNA Sequencing

In 2000, the US government promoted a race to sequence the human genome and created a program to begin the effort. Taking up this huge

technological challenge, private venture capitalist, Craig Venter, beat the government agency created for this purpose and, by 2003, sequenced the entire human genome. Now, the war over the rights to DNA is fought in government regulatory, scientific, and judicial forums, but the knowledge that has come from unraveling our DNA has revolutionized disease research, medical care, and law enforcement. The government's initiative and the private sector's success formed a new partnership that resulted in one of man's greatest achievements whose ramifications are not yet fully known.

### Biometrics

Biometrics represents a revolution in identity management. Nearly all driver's licenses, many credit cards, and organization badges are encoded with personal unique identifiers whether a fingerprint, an iris scan, a DNA sequence, a blood type, or some combination thereof. Every individual possesses their own, unique, intimate markers, and biometrics are becoming the identity management tool of choice by a wide range of governments (Electronic Frontier Foundation 2015). Data stored in the huge databases described above may in turn become "Big Data," able to be exploited for a myriad of uses.

### Frequency

Three frequency developments are changing the way public administration works. Closely related to the biometric identity movement is a frequency tool known as radio-frequency identification or "RFID." RFID was developed in World War II and used to track movement of materials. RFID is now commonplace in industry and governments in identification cards for access control, parking tags, driver's licenses, shipment tracking, and many other uses (Neuby and Rudin 2008). Smart electric meters replace existing dial meters and remotely send electric usage data to distant utilities, many of which are government operated (Energy Independence and Security Act of 2007). Control centers will be able to reroute electricity from where it is not used to where it is needed. Soon, a network of frequency-enabled appliances, termed the "Internet of Things," will combine data on home appliance use with smart meter technology to allow remote control and efficient utilization of electricity. The power industry and governments will be challenged to manage and regulate it well.

## Conclusion

Scholars have shown that organizations that adopt technology learn and mature but those that do, learn at an uneven pace. In other words, not every organization that brings database management or a new website is going to learn equally or in the same ways. It can bring efficiency and effective outcomes but those depend on the management and policies set forth for its use (Heintze and Brettschneider 2000). Organizations often adopt technology without a clear goal or a policy in place (Mergel and Bretschneider 2013). The technology itself becomes the goal. Without proper management, policies, and support, technology can reduce efficiency and effectiveness like a millstone holding the organization back. While many see technology as a panacea, we should consider that it does not alter hierarchy and management style nor decrease red tape unless the organization has a long history with a particular technology (Luna-Reyes and Gil-Garcia 2014; Pandey and Bretschneider 2013). In those rare cases, the organization has learned how to manage.

Having technology requires skilled management and support as well as upgrades to hardware and software. Organizations often lack the requisite staff and budget fluidity to keep up with new developments. An element of "keeping up with the Joneses" is in place where if one organization has certain capacities, all the organizations around it have to have the same abilities. If the private hospital has a PET scanner, the public hospital will need one too. Savvy salesmen can promote larger, more advanced purchases than are often warranted, and at other times, technology may be bought because it is the end of the fiscal year and the money is used for technology purchases. Better to use than lose it.

The public expects organizations, whether public, nonprofit, or private, to have the latest technology by which to deliver services. As more governments engage the public through e-government portals, more data is accessible and thus at risk. Serious cybersecurity breaches have occurred in the US federal government in the Department of Defense and the Office of Personnel Management and lesser events in state and local venues. As mobile applications spread throughout the country, security of organization data will be an even bigger concern. Nonprofits are less worried because of the salience of their databases. Few hackers are interested in lists of donors or volunteers, but this does not mean nonprofits can let their guard down.

Technology creates a market for itself. Once purchased, whether that be computer networks, servers, industrial equipment, or heart monitors, devices wear out requiring continual upgrades and maintenance. In tight budgets every dollar spent on technology is money not spent on other needs. Technology needs challenge all budgets and globalization further promotes the "must have" mentality: organizations cannot afford to be left in the dark with global clients. Technology is one of the biggest, and growing, sectors in public budgets today, and there is no end in sight as new advances enter the market.

We love our phones, computers, scanner/copiers, and the like, and our agencies run well in established routines, but when systems go down, chaos erupts in nearly every agency and little work is done. "The system is down" has become a euphemism to denote that no work will be done as the organization is dependent on machines that, like all other machines, sometimes fail. When this happens, organizations most often move toward the client, bending the rules or processes to deliver service (Tummers and Rocco 2015). Technology can limit organizations to the boundaries of its durability.

Machines can now do what the hand, eye, and mind once did in different ways and beg a question on which there is scant research. How does technology impact human growth patterns that come from working with others in organizations? Are we are less able to engage personally with those at work? It is said that computer systems save energy, paper, and therefore the environment and that using technology is "green." Yet having instant printing at one's fingertips would seem to promote use of more paper and power than if one was forced to retype a document.

Last but certainly not least is the issue of privacy about which there are as many questions as answers. If data is Internet accessible, it is at risk. A few large and hundreds of small breaches have thrown large masses of personal information to the wind. Security seems to require that our information be collected but what happens to it after that? Who has control and how is our data used? With the recent revelations about how our national security agencies collect and use data, Fourth and Fifth Amendment issues are raised. There are no answers to satisfy all, and it is apparent that more data is being collected now than ever before. Big Brother concerns are legitimate as organizations move more and more of our work and private lives into bits and bytes.

Many other technologies and adaptations are worthy of discussion here if time and space permitted. One thing is for sure – technology has revolutionized the way our organizations work and will continue to do so in the future and pose many as yet unseen challenges in the years ahead.

# Organizational Theory in Japan

Reiko Arami
Nagoya University, Nagoya, Japan

## Synonyms

Open office layout system; The Japanese organizational theory; The turf war

## Definition

Theoretical trends in organizational theory as developed in Japanese public administration and bureaucracy research, and the characteristics and current realities of Japanese public organizations.

## Introduction: Original Agenda of Bureaucracy and Organization in Japan

There are many commonalities shared across public administration, bureaucracy, and government under the rubric of "public organization." Japanese public administration theory has been significantly affected by the USA. This is especially true in terms of organizational theory despite the substantial differences between the two countries' democratic systems. As a result, Japanese organizational theory initially developed in two directions, theoretical and practical. Theory then evolved through ingesting other social science research. Later, empirical research has gradually been incorporated into theory, leading to convergence between theory and practice. This paper considers these characteristics of Japanese

organizational theory and how it has differentiated over time by exploring its origins, development, and transformation.

The paper begins with an overview on the origins of bureaucracy and organization research proceeds to how Japanese theory has been affected by scientific management, classical theory, modern theory, and decision-making theory. Next, it describes how Japanese researchers transformed organizational theory to fit the realities of Japan's systems and issues, covering decision-making processes such as ringi-sei, "interagency struggles" understood as as sectionalism (*sekushonarizumu*), the open office layout system (*obeya-shugi*), and the well-defined mobilizing system (*saidaidoin*). Then it follows how Japanese theory diverges from these earlier trends in research by introducing behavioral theory, contractual theory, social system theory, and institutionalism, among others. In addition, it focuses on recent topics, such as reputational theory and organizational ecology. Finally, this paper concludes by considering future research directions.

## Japanese Organizational Theory Affected by Foreign Theory

In a dictionary, the word "theory" is may be defined as "a plausible or scientifically acceptable general principle or body of principles offered to explain phenomena" (Merriam-Webster dictionary). Organizational theory is a body of general principles for explaining organizations. According to Starbuck (2005, p. 143), although people have been creating organizations for many thousands, perhaps tens of thousands of years, generalizations about organizations are almost entirely products of the last half of the twentieth century. People proposed very few generalizations about organizations before 1850, when a trickle of making such propositions began. Propositions about organizations remained infrequent until the late 1940s, and they did not become prevalent until the 1960s.

A similar transition has been taking place in Japan, although at different times. In this section, we examine how the study of organizations has developed in public administration and adjacent fields. "Organization" is one of the main concepts used in public administration. As Woodrow Wilson (1887) pointed out, "The field of administration is a field of business" (p. 493). American public administration has characterized the management of organizations through focusing on the commonalities between public and private organizations. Therefore, although the topic of this article is "organization theory in Japan," this article mainly focuses on public administration.

From around the 1950s onward, overseas research on organizations in various social science fields began to be introduced to Japanese scholars. Since 1980, the success of Japan's economic development has attracted worldwide attention. In order to explore the factors behind this success, international researchers have looked to political science and economic studies of Japan with particular attention paid to Japanese "organizations" such as its bureaucracies and business organizations. Case studies focusing on Japanese organizations also began to emerge. Since the 1990s, new institutional economics gained ascendency in scholarship, under which research on the economics of organizations has flourished. However, the concomitant diffusion of new institutionalism in political science had an opposite effect on research on organizations, with dwindling interest in public administration and little progress made in generating related empirical research. This has contributed to a lag in the advancement of research by Japanese scholars on the topic of organizational theory compared to overseas scholarship. In the following, this trend is examined in detail.

### Before and After World War II

Consideration of organizations began in the 1920s. Some Japanese translations were published to introduce Marxist theory of organization and anarchist theory of organization, as well as to introduce principles for the management of factory organizations based on the newly proposed theory of scientific management. In addition to these translations, there were publications on such topics as examination of industrial organization overseas (Kojima 1928), industrial

organization theory (Kitazawa 1930), and market organization theory (Uchiike 1924).

In the 1930s, essays on organizations related to public administration were also published. For example, Masamichi Royama wrote "Administrative Organization Theory" in 1930 (Royama 1965), and Hiroshi Ikeda, a bureaucrat in the Ministry of Home Affairs, left behind a treatise on the local government of Tokyo called "Tokyo's Ward System Theory" (Ikeda 1935). Masamichi Royama was put in charge of the newly established Department of Public Administration at the Faculty of Law, Tokyo Imperial University, in 1927. Royama was a pioneer in public administration, studying it through a functionalist approach and describing state functions and tasks. Along with making direct observations about administrative structure in England through his own travels, he studied administrative structure and organizational management at the London School of Economics and at Oxford University, with particular attention to the British cabinet system and reforms carried out in central-local relations in wide area administration. He was considering how to adapt and apply scientific management methods from overseas to Japan, but in the end, practical experience and theoretical considerations were not joined. In general, these studies were based on the compilation of observations about organizations regardless of the field. This research approach played an important role in the early development of the field, though it is very different from contemporary organizational theory.

## Organizational Theory Boom and Introduction of Overseas Research

In this way, although organizational theory found its way to Japan in the 1920s and 1930s, research on organizational theory in Japan started late, on a foundation of overseas theoretical developments in the 1960s. These foundational theories were proposed before and after World War II. American mechanical engineer and early management consultant Frederick Winslow Taylor produced many methods under the umbrella of scientific management, with the core being divisional management using the "science of work" to measure and standardize work. With the spread of workflow systems, management attention turned to the establishment of management structures, giving rise to classical organizational theory based on the principle of centralized command and the differentiation of staff and lines. In addition, human relations theory/neoclassical organization theory that focused on informal organizations was born. Building on these theories' emphasis on human behavior, modern organization theory emerged, triggered by the publication "The Functions of the Executive" by Chester Bernard in 1938 (Nishio 1990, p. 63).

It was after the 1950s that such organization studies from other countries were imported and introduced to Japan. Political scientist Takeshi Ishida criticized the boom in organization theory, which sprung from a desire to solve various post-war problems but led to excessive expectations and only served as a bandaid, given the difficult, social and political challenges facing Japan at the time (Ishida 1961, p. 238). Examination of the pre-war period revealed that organizations that were supposed to be independent and grassroots, such as found in Europe and the USA, were nonetheless absorbed by and came under the control of the government. This led to discussion on how Japan could establish a true democracy "from the bottom" as well as organization "from the bottom" in the post-war system. This question led to Japanese scholars poring over research from abroad.

Obviously, not all overseas organizational theories have been introduced to Japan. And the theories introduced in Japan are deeply related to the concerns about organizations in Japan. In addition, postwar public administration in Japan has been greatly influenced by American public administration. The history of organization theory in Japan contrasts with the history of public administration theory and managerial thought in Japan.

Of the foreign organization theories imported into Japan since the 1960s, American public administration research has been especially influential. At the time, American public administration theories were recognized as follows. The genealogy of American public administration

has two lineages: administrative theory and organizational theory (Nishio 1990, 2001). The public administration theory lineage arose from politics-administration dichotomy theory, morphed into public management studies, and then evolved into a politics-administration integration. The organizational theory lineage developed from scientific management methods, classical organizational theory, neoclassical organizational theory, and modern organizational theory. These two developed in parallel, and the two systems of classical organizational theory and administrative management theory were combined. Influenced by these developments, theories from abroad were introduced to Japan. In the first issue of the journal of the Japan Society for Public Administration, as an introduction to theoretical trends in public administration, Kiyoaki Tsuji categorized overseas research trends into three schools: the efficiency school that inherited the tradition of scientific management methods; the human relations school of Bernard and others; and the social environment school of Selznick and others. Many subsequent papers dealt with organizational theory, introducing many theoretical trends related to organizational theory from the 1960s to the 1980s. In particular, the 1975 Annual Review of Public Administration featured a special issue on "Organizations and People in Public Administration." In general, the influence of L. Gülick, P. Selznick, D. Waldo, C. Barnard, H. Simon, and J. March is significant. In the 1980s, there was a debate on how to respond to the two separate American theoretical lineages.

I would like to add that, like the study of organizations in the USA, organizational theory has spread to other areas of social science besides public administration.

For example, in political science, Takeshi Ishida examined key issues in modern organizational theory by applying Simon and Bernard's discussion and G.H. Mead's research with Waldo, Goodnow, and J. March at that time, and presented an analytical perspective that views the organizational process (basic human relations) as a symbolic process. Using agricultural cooperatives as a case study, he conducted research on pressure groups.

In sociology, Kenichi Tominaga (1997) analyzed Japanese management and business organizations sociologically, using organizational theory, P. Blau's social exchange theory, and Luhmann's social system theory as analytical perspectives.

## Transformation to Fit the Japanese System and Agenda

Starbuck (2005, p. 161) examined the development of organizational theory development and found that research in organizational theory after the nineteenth century generally can be categorized under two major themes. One theme emphasizes the defects of bureaucracy and studies how bureaucratic governments affect societies. The second theme focuses on how organizations can operate more effectively. He said that these themes were motivated by both perceived threats and perceived opportunities. Those who wrote about *bureaucracy* usually perceived it as a threat to something, such as to good government and individual freedom. In contrast, those who wrote about *organization design* were more likely to perceive organizations as offering attractive opportunities for something, such as efficient production, control by owners, and enhanced cooperation. After the 1960s, these two major themes merged, and organizational research became more scientific and empirical methods become more transparent.

As mentioned in the previous section, Japanese scholars have not produced many generalized theories that can be compared to those developed by researchers in other countries, but research in Japan has been conducted with a similar awareness of issues related to organizational design and decision-making. Such issues include how to manage superior-subordinate relations, how to overcome the dysfunction of the bureaucracy, how to effectively educate staff, how to optimally divide labor into specializations, and how to best use technologies. Some of these questions are examined below. This research is divided into two categories: research that uses foreign theories to explain the Japanese bureaucracy and Japanese

administrative organizations, and research that springs from observations that are especially characteristic of Japanese bureaucratic and administrative organizations.

What follows is an overview of research on four main topical themes in the latter category. These are: decision-making processes such as *ringi-sei*, interagency struggle or turf war as *kakkyo* or sectionalism, Japan's well-defined mobilizing system called *saidaidoin*, and a particular open office layout system, *obeya-shugi.*

### *Ringi-sei* Decision-Making Process

The "Ringi-system" was discussed in "A New Study of the Japanese Bureaucracy" by Kiyoaki Tsuji (1969), which is considered a classic study of Japanese bureaucracy. Specifically, Tsjui describes this process in which plans and decisions in the administration are made by first circulating a written request for approval, drafted by those closer to the bottom of the organizational hierarchy who then forward the document to formally receive a greenlight through a signature stamp called an *inkan* or *hanko* by the relevant officials. Next the stamped written request is relayed to higher officials for their review, who in turn transmit the document to the final decision-maker for approval. As a general rule, it is not necessary to hold a meeting at any time during this circulation and approval process. Although only the head of the administrative organ has the legal authority to approve a written request, this lengthy decision-making process continues to be practiced. Tsuji criticized this practice by pointing out that while it has certain benefits in terms of making it impossible for concerned parties to raise objections, securing cooperation, and preserving records, it has disadvantages in terms of reduced efficiency, dispersion of responsibility, and lack of leadership. Others have responded to Tsuji's criticism by contesting the accuracy of some of his characterizations of the process and asserting that the process is actually more flexible. Organizational decisions are also made through meetings and other processes without *ringi-sei* (Inoue 1981; Omori 1985). In addition, there are variations in the practice of *ringi-sei* in different ministries and agencies (Shiroyama et al. 1999).

### Interagency Struggle or Turf War as *Kakkyo* or *Sectionalism*

The concept of sectionalism, which was proposed by Kiyoaki Tsuji (1966) as a characteristic of the Japanese bureaucracy, was examined mainly by Tsunao Imamura (1978, 2006). Interagency struggle can be found to a greater or lesser extent in the administrative bureaucracy of any country, but its manifestation tends to be unique within each country. This is because bureaucracy is a historical and cultural phenomenon. After the Meiji Restoration, which aimed to dismantle shogunate rule and consolidate imperial control of Japan, a modernized "Kansei" bureacratic system was established. This Kansei continued to guide the ethos of the bureacratic system after World War II, resulting in conflict and competition among ministries and agencies over authority and jurisdiction. Imamura examined the ambivalence of the traditionally negative concept of sectionalism, and discussed the utility of interagency conflict and the need to manage conflict (Shimada 2011).

### The *Saidaidoin* Mobilization System

Focusing on the fact that the number of civil servants in Japan is small compared to other countries, Muramatsu (1994) summarized the state of the Japanese administrative system to date as "a system that efficiently mobilizes all human resources, funds, and institutions toward a goal." This system "has attempted to maximize the mobilization of the resources of society as a whole through the creation of networks that transcend administrative organizations and include private organizations, albeit on a ministry-by-ministry basis." He says that this is an "activist bureaucracy," a bureaucracy established under a continental-style administrative system in which the government plays an active role. He criticized this system for being rational as long as the goal was to catch up with the West, but after this goal was achieved, it began to work in a dysfunctional manner.

### The *Obeya-shugi* Layout System

Wataru Omori (1980, 1990, 2006) spearheaded research on the total control administrative management system and the open office layout

system, which are preeminent practices that characterize organizational arrangement in Japan. He clarified the characteristics of the large-room system, which is very different from the Western system of individual rooms and jobs specifically assigned to one individual. ***Obeya-shugi*** is the principle that the official unit of work assignment is the division or section, not an individual employee. It is the division of work among organizational units rather than among staff members. The tasks that individual staff members are responsible for are general in nature. The duties of each individual staff member are not clear as in a job classification system. Each staff member belongs to one of the organizations. Except for administrative staff, they are not directly assigned to individual job posts. They work together in a physically spacious room. They form a "territory" of desks. They sit opposite each other at their desks. Personnel transfers are carried out collectively by the human resources department within the government-wide general affairs organization. Direct supervisors do not do this. New employees learn how to perform their work through on-the-job training. The system is designed to avoid any disruption of workflow if a staff member is assigned to a new position. An advantage of the open-office layout system is that staff members can cooperate with, support, and assist each other while sharing the duties of the section as appropriate. A disadvantage is that although staff members can mutually evaluate each other's work performance, it is difficult to evaluate the performance of individual staff members. In particular, since a vague and reasonable "market rate" is formed for personnel evaluation, it is important to form and maintain human relationships. Having a nice disposition and regular communications with co-workers is important. The number of staff in an open office often remains unchanged, while the number of duties may accumulate, frequently exceeding the capacity or number of staff.

## Empirical Studies That Apply the Lens of Foreign Theories

The studies outlined above draw from real-life observations of the Japanese bureaucracy and Japanese administrative operations. The challenge then is how to relate such research to concepts in organizational theory developed overseas. Other empirical studies that use foreign theories to explain the decision-making mechanisms, organizational management, and organizational behavior of the Japanese bureaucracy have advanced in parallel with foreign studies. For example, Izuru Makihara (1994–1995) examined "consultation," a mechanism for horizontal coordination among central government organizations such as the Ministry of Construction, the Ministry of Agriculture, Forestry and Fisheries, and the Ministry of Transport, using construction management policy for public facilities as a case study, and found that coordination takes place in individual "consultation units."

Some studies also explain the implementation process of individual policies from the perspective of organizational theory. Hideyuki Takechi (1996) applied Simon's theory and principal-agent theory to study organizational control in the process of administering public assistance and community welfare in Japan. He argued that when the predictability of bureaucracy is reduced, the bureaucracy is more likely to manipulate information and incentives in order to obtain the maximum effect with the limited administrative resources of authority, financial resources, information, and personnel available. He also asserted that social relations are transformed into intraorganizational relations to ensure the efficiency and effectiveness of resource allocation and supply processes, which can indirectly improve the welfare of the people. In addition, he theorizes that the source of control is the authority of status rather than the authority of function. Altogether these factors uphold a system that prioritizes supplier sovereignty over consumer sovereignty, with incentive control as the key to control rather than information control.

On the other hand, while most research at the time focused on the central government, some studies emerged that examined the administrative organization of local governments and demonstrated their dissimilarities from the central government. Tao (1990) conducted a groundbreaking empirical study of the organization of local governments. He developed a theory of city hall

organization that focuses on a comparison of public and private organizations and a theory of organizational management that analyzes the behavior of section chiefs in city hall. He found that the bureaucratic model does not accurately characterize local governments, and instead demonstrated that Japanese local governments are organizations with more flexible functions by necessity. In particular, he argues that section chiefs in local governments should have the ability to act as "political managers" who can make decisions based on their understanding of the administrative environment and make value judgments as a member in an open organization that transcends the formal human relationships of subordinates, superiors, and colleagues.

## Focus on Japan and the Japanese Organization and the Bifurcation of Organizational Studies

Since the 2000s, research on bureaucratic and administrative organizations has ceased to apply concepts from organizational theory. Although the field of New Public Management (NPM) is closely related to organizational management, it has more of an emphasis on analyzing the current situation as it relates to institutional reform. For example, Hisashi Harada (2005) examined the broad reorganization of Japan's central government after the NPM reform, which included the separation of planning and implementation, the agency system, and the local independent administrative agency system. In particular, he examined interorganizational management of outsourcing, but did not apply organizational theory.

Second, since the 1990s, the theoretical trends in public administration in Japan have been strongly influenced by the new institutional theory popular in political science. As a result, public administration has been studied through a political process theory lens, with bureaucracy as one of the actors. For example, this research applies corporate contract theory, i.e., principal-agent theory, transaction cost theory, and game theory. Most of the research in this vein considers bureaucracy not as an organization but as a group of actors. In addition, the bureaucracy is positioned as a politician or an object controlled by politics. As a result, it has become unfashionable to analyze the internal organizational structure and nature of decision-making by focusing on the organization and the people who make up the organization. Although there has been a number of studies on bureaucracy that apply foreign theories, such as contingency theory, Daniel Carpenter's reputation theory (2001, 2010), and newer theoretical frameworks, they have been cited in Japan in fields other than organizational theory, outside of the theories' research origins.

In the 1980s, in order to understand the success of Japan's economic development, there was a lot of research conducted in the West on Japan in both the fields of political science and economics. In particular, in the study of government-political relations, political scientists from overseas conducted empirical research to come up with a theory of political superiority that rejected the theory of bureaucratic superiority, which had been the dominant argument in Japan, sparking debate. Since the 1990s, under the longstanding system of the one-party dominance of the Liberal Democratic Party (LDP), the nature of Japan's governance structure has been called into question, and a number of institutional reforms have been implemented to address the issues of how to strengthen the leadership of the prime minister and how to build a democracy in which there is a change of government. These reforms were attempts to strengthen politics against bureaucracy, and it can be said that research trends were dragged along.

In the fields of economics and business administration, unlike political science, the focus was rather on Japanese corporate "organizations" and organizational decision-making mechanisms, which are characterized by lifetime employment and seniority. Masahiko Aoki's series of studies (1988, 1989) using comparative institutional analysis received international acclaim and had a major impact on the above-mentioned research trends pursued by public administration scholars in terms of both conception and theory. Despite this, theoretical updates in the analysis of

Japanese administrative organizations and bureaucracies have stagnated.

Third, although empirical research has become standard in Japan, the disclosure of information on administrative organizations has not progressed, and the empirical data necessary for organizational research is difficult to obtain, unlike in other countries.

The only exception to these trends is a study by Shin (2013). By applying the population ecology model of organizational sociology and following the growth and decline process of health centers, Shin provides an excellent historical account of the mechanism of selection of health center organizations and municipalities by the Ministry of Health and Welfare. Although there are many theories that explain the growth or decline of organizations, this book clarifies aspects of organizational growth and decline together.

Since the 2000s, various administrative reforms have been implemented, starting with the reorganization of central government ministries and agencies; the implementation of NPM and other reforms in central government ministries and agencies as well as in local governments; the introduction of outsourcing and other forms of externalization, and the privatization of management. In addition, with the gradual development of digitalization and other technologies, the mechanisms that were once studied in Japan, such as the *ringi-system, sectionalism, saidaidoin*, and the *obeya-shugi* are likely to be transformed. An empirical examination of the state of administrative organizations in Japan after the reforms may have much to add to organizational theory itself.

## Conclusion: The Lost Three Decades

In this essay, the development of organizational theory in Japan is examined, and the following points are made clear. The development of organizational theory also corresponds to research trends in public administration in Japan. In Japan, the introduction of overseas research concepts was the main focus until the 1960s. Research was divided into two categories: research that used overseas theories to explain the Japanese bureaucracy, and research that identified characteristics and derived from observations of Japanese bureaucratic and administrative organizations. The latter has not received much international recognition, but it is necessary to examine its relationship to overseas organizational theories. In addition, of the two categories of organizational theory research, the themes related to bureaucracy and bureaucratic organization continue to take different forms, but there has been little empirical research on administrative management that enhances organizational efficiency.

Three major issues remain as challenges for organizational studies in Japanese public administration. First, there is a bias toward theoretical trends imported from overseas. As Japanese studies have flourished in Japan since the 1980s, Japanese scholars have begun to draw from Japanese political science instead of following the research trends in public administration and adjacent social sciences overseas. As a result, organizational research has become thin. With the decline of Japanese political research itself internationally, the development of theories has waned. Specifically, studies exploring postmodern theory, particularly interpretive theory, which is prevalent in other countries and other social science fields, have been ignored, and despite changes in the way ministries, agencies, and local governments have been organized since the 2000s through NPM-type reforms, these changes have not been sufficiently analyzed to address real issues. In the future, the digitization of government will continue. As the digitization of public administration advances in the future, the nature of organizations and decision-making within organizations are expected to change drastically, and there is a strong need for research to examine these areas.

Second, there is a need for methodological innovation and remedying the thinness and weakness of the empirical foundation of administrative management research, which is in turn the foundation of organizational theory research. Michio Muramatsu (1983, p. 57) also pointed out this issue in discussing the challenges and prospects of public administration. The scholarly treatment of the various issues related to organizations in

Japan, such as those introduced in the previous section, are mainly narrative and have not been refined to the point of being demonstrable propositions. In addition, regarding methodology, public administration research as a whole lags behind in collecting data related to organizations in a manner comparable to what is found in oversea studies, because researchers in this area often do not have the necessary skillsets to obtain primary data through means such as interviews and surveys.

Third, the state of data acquisition needs to be improved. Related to the second point, in business organizations, data related to organizational management is becoming more available, and joint research with companies is progressing, especially in economics. However, this is not the case in the field of public administration in Japan, where there has been less effort on the part of academia to fill this gap. Acquiring data and accumulating proper empirical research is vital for informing international comparative analysis of Japanese organizations.

Although there was a focus on the strength of Japanese organizations in the 1980s, a comparable assessment has not yet been carried out more recently. Current dysfunctions at the ministry level and other factors need to be fully examined. In addition, researchers need to answer fundamental questions such as how bureaucracies will be transformed, how they will affect society, and how organizations can work efficiently with the introduction of digitalization and other technological advances in public administration.

Reviewing the origins of organizational theory, Starbuck (2005, p. 176) has observed that organizational theory has developed considerable complexity, but the complexity of organizational theory makes sense, since organizations are diverse and complex, and they inhabit diverse and complex environments. He also pointed out that this complexity poses the classical dilemma of how complicated theories should be and that complex theories capture more aspects of what researchers observe, but they are more difficult to understand. Simple theories are easy to understand but they may overlook phenomena that some people deem important. In the case of Japan, the field of public administration in particular has not yet reached the stage of facing this dilemma. It is necessary for empirical research to evolve in order to compare the characteristics of existing Japanese administrative organizations. That is the task as was exhorted by Masamichi Royama, a great authority on public administration in Japan.

# Organizational Turnover

Riann Singh
The University of the West Indies, St. Augustine, Trinidad and Tobago

## Synonyms

Hiring and firing; Staff renewal rate; Staff resignations; Staff turnover

## Definition

Organizational Turnover refers to the process of employees leaving their job or organization of employment within the context of human resources.

## Introduction

Attracting, developing, and maintaining an effective workforce remain a challenge for all organizations and appear to be a management goal that remains elusive, especially when organizational turnover is not properly managed. The fact is that employees leave their job or organization of employment voluntarily or involuntarily, resulting in the turnover issue. Employees may seek career advancement and promotion elsewhere, and competitors and the wider job market may offer many attractive job alternatives. Organizations may replace low performers and economic factors may require downsizing resulting in job losses and lay-offs. Generally, therefore, voluntary turnover is attributed to the decision of the employee to seek alternative employment, while involuntary turnover is attributed to the employer's decision to terminate employees and to uncontrollable factors such as economic downturns.

Turnover, whether voluntary or involuntary, occurs in all organizations regardless of sector. Yes, the very nature and structure of public sector employment has become known for security of tenure with rewards and promotions linked to tenure and less involuntary turnover. At the same time, this sector has become known for more voluntary turnover especially in key or pivotal roles within developing economies. Yes, organizations may be pleased if the employees it labels as poor or average performers voluntarily quit yet disappointed if its high performing, potential stars leave. It is also true that low turnover can encourage creative stagnation and fresh thinking can be compromised. Generally though low turnover is seen as unproblematic, high voluntary turnover is deemed as costly and dysfunctional.

There is little dispute that the costs associated with voluntary turnover can be quite high regardless of the state of any economy. The total cost of voluntary turnover, including employees' reduced or lack of effort on the job and absenteeism prior to actual turnover, the disruption of the social and communication structures of employees who stay, the decrease in the cohesion and commitment among members of the workforce who may choose to stay, as well as the cost of hiring, training, developing, and retaining new recruits can amount to anywhere about and upwards of one-fifth of any company's annual pretax income on a rough estimate. The direct and indirect costs associated with this organizational issue can indeed be far reaching and can even be higher given that many indirect costs associated with turnover are not easily quantifiable. Voluntary turnover is also one of the most important criteria for evaluating and assessing organizational processes in public sector entities, such as employee recruitment/selection, which can impact service delivery as well. The public sector is the right hand of government in delivering services to the public. High turnover is therefore seen as an indicator of inefficient and ineffective organizational processes, which can reduce service quality and negatively impact the delivery of services within the public sector.

Since public administrations invest heavily in their employees and organizational processes, managers at all costs should attempt to minimize turnover. In order to address this issue of high turnover, it becomes important to answer the question: "Why do employees voluntarily leave their job and/or organization; what factors prompt the decision of employees to move on and how can managers address this issue"? If managers are to address voluntary turnover, it becomes imperative to first understand why employees leave.

## Perspectives on Organizational Turnover

For at least six decades, researchers have theorized about and empirically examined voluntary turnover to help management practitioners understand why their employees may take the decision to leave. Most of the early turnover models grew from the pioneering work of March and Simon (1958), which suggests that if employees are dissatisfied with their current job situation, they search for job alternatives, compare the alternatives to their job, and leave if any alternative is deemed better than their job. Steeped in this pioneering perspective of March and Simon

(1958), the attitudinal models of turnover emerged. These models focused on employee attitudes, job satisfaction and organizational commitment, as precursors to voluntary turnover. These attitudinal models argued that if employees are not satisfied with their job and if they are not committed to their organization of employment, managers should expect employees to leave (Mobley 1977). Further research on these employee attitudes suggest that satisfaction and commitment are shaped by many factors (Price and Mueller 1981) including perceived organizational support, perceptions of justice and employee burnout/stress, pay, social integration, communication, centralization, training, opportunities for promotion, and professionalism and that these attitudes combine with successful job searches to negatively predict voluntary turnover. These ideas summarize the attitudinal perspective on turnover.

A second perspective on voluntary turnover focused on nonwork factors. These models, known as the spill-over model of turnover, were based on the premise that family attachments, conflict between work and family roles, and nonwork commitments can explain why employees may leave their job or organization much more than employee attitudes.

Coinciding with the spill-over model was the organizational-factors model, which argue that organizational factors also shape voluntary turnover. Organizational inducements for employees to stay can derive from many factors such as working on projects and working in groups or teams, which increases the attachment that they feel to their job.

Newer perspectives explaining voluntary turnover focused on the decision to leave, outlining the different paths employees take as they choose to exit or leave their job known as the Unfolding Model of Voluntary Turnover (Lee and Mitchell 1994). This perspective suggests that employees make the decision to leave their job over a period of time and that even if employees are satisfied, committed, and choose not to engage in job searches, they may still leave due to shocks, jarring or precipitating events, rather than negative attitudes. This perspective therefore draws attention to the decisional aspect of voluntary turnover.

The most recent perspective on why employees voluntarily leave is Job Embeddedness theory (Mitchell et al. 2001). This perspective examined the issue of voluntary turnover by providing answers to the opposite question of why do employees stay? It suggests that there are on-the-job and off-the-job factors which determine how well employees fit with their jobs, the extent to which they develop linkages in their organization and the benefits they accumulate (termed sacrifices, if forfeited by leaving) over time. If employees fit well, if they develop strong linkages/relationships, and if they have to sacrifice a lot by leaving their organization and community, employees stay.

In summary, there are five broad perspectives that attempt to shed light on the question of why employees voluntarily leave their jobs/organizations of employment. Indeed, the issue of voluntary turnover has been and continues to be problematic, costly, and dysfunctional for public administrations. Turnover cuts at the heart of the organization since it has to do with human assets, the employees. For years, researchers and practitioners searched for answers to manage voluntary turnover and continue to do so in the hope of finding answers that offer a more holistic approach.

## Analysis: Managing Organizational Turnover

Suggestions on how to best manage organizational turnover stem from the five perspectives aforementioned, which each assume that in order to manage the turnover issue administrators must identify the underlying causes of turnover.

First, the attitudinal models suggest that the employees are at the heart of the organization, a tenet central to the practice of human resource management. Since these models focus on employee attitudes of satisfaction and commitment as precursors to turnover, attempts to manage turnover should focus on enhancing job satisfaction and organizational commitment. Indeed, from these models, it is deduced that if organizations focus their efforts on keeping their

employees satisfied and committed, they are expected to stay. They will not be motivated to search for job alternatives regardless of the state of the job market and will not leave their organization of employment. How logical is this argument? Yes, employees are at the heart of organizations and their attitudes are important. This point underlies human resource management. However, employee attitudes alone cannot predict voluntary turnover and managing those attitudes cannot guarantee that employees will stay. Employee attitudes account for as little as 5% of the variance in voluntary turnover (Griffeth et al. 2000) and when job markets offer attractive job alternatives as developing markets do, employees leave public sector jobs even if they are satisfied and committed (Carsten and Spector 1987). In many developing growing economies across the globe, there is the recent trend of employees moving from the public sector to private sector jobs coincident with economic development. The attitudinal models of turnover therefore offer some propositions for managing turnover focused on the employees, but alone, boosting employee attitudes may be insufficient to deal with the turnover issue.

Second, the spill-over model suggests that there are factors which may be outside of the organization or off-the-job that can impact on the decision of employees to leave. This perspective therefore implies that managers should focus on work-life balance policies to address voluntary turnover. Work-life balance policies have emerged within fairly recent times as a contemporary trend in the practice of human resource management. These policies recognize that the lives of employees are often imbalanced with little time or energy for other activities at home and hence provide time for leisure, community, and citizenship activities. Yes, work pressures and job attitudes spill-over to impact nonwork activities and commitments and similarly nonwork activities like family responsibilities can spill-over to impact work activities. It has also been suggested that nonwork commitments were better predictors of leaving an organization than some employee attitudes and hence offers a comparatively stronger approach for dealing with organizational turnover.

Third, the organizational-factors model suggests that focus should be placed on factors within the organization that can shape the decision of employees to voluntarily turnover and not employee attitudes. To manage the turnover issue, managers should therefore work on structures and creating a work environment that build attachment between the employee and his or her organization. For example, using teams, groups, and project work can encourage employees to work together and induce attachments to their jobs and organizations. In many public sector organizations, the working environment is characterized as bureaucratic and the conservative style of management emphasizes routine rather than collaboration. Management attitudes incline towards holding on to power and hence towards dictating orders rather than participation, teamwork, and group work. These characteristics make it difficult to encourage the development of inducements for employees to stay. In recent time, there have been some attempts to encourage teamwork and project work within public sector organizations in developing economies although to a limited extent. The bureaucratic work structures still predominate, thereby making the organizational-factors model of limited value in managing turnover in this sector.

Fourth, the unfolding model of turnover examines the decisional aspect of voluntary turnover and the different ways in which employees leave. To manage voluntary turnover, this perspective implies that focus must be placed on understanding the factors which precipitate shocks since there are precipitating events that shake employees or jolt them into the decision to leave, regardless of their satisfaction, commitment, and job search. However, the content of shocks precipitating the decision-making process of employees to leave their organization are less explored, although there have been suggestions that some turnover happens quickly, some happens more slowly, people leave organizations in different ways, and that shocks can occur frequently off-the-job as well. Managers are therefore provided with some clues as to the decision of employees to leave which may be unrelated to their attitudes and their job searches through this perspective.

Fifth, the job embeddedness model suggests that on-the-job and off-the-job fit, links, and sacrifices enmesh employees and keep them attached to their organization. To manage voluntary turnover, this perspective suggests that managers should focus on selecting employees that fit well with the goals and values of the organization. They should also provide a work context within the organization that encourages social networks and relationship building and promote the development of linkages with others in the organization. As the fit between the employee and their organization of employment increases and the linkages they develop are strengthened within their organization, they would perceive it as too costly a sacrifice to leave. In these ways, employee turnover can be managed and employees are expected to stay with their organization. Further, if employee fit well within their community and develop strong ties there, they should be further motivated to stay in their organization of employment since moving or leaving becomes a sacrifice they will not be willing to make. This proposition for managing voluntary turnover has been widely supported within the existing body of turnover research and empirical studies as fit, links, and sacrifices have been found to offer valid explanations for why employees stay. Mitchell et al. (2001) provided initial empirical support for job embeddedness as a strong negative predictor of voluntary turnover intentions and subsequent actual turnover. Since then, empirical studies across the United States and more recently in India and the Caribbean offered strong support for embeddedness as a mechanism for addressing voluntary turnover. In fact, job embeddedness indisputably was found to offer considerations for the management of turnover that significantly addressed the issue beyond all other existing turnover models. Embeddedness assessed new and meaningful variance in turnover in excess of that predicted by the major variables included in almost all the major models of turnover. This finding puts embeddedness and the idea of enhancing increasing fit, links, and sacrifices to reduce turnover as one of the most valid perspectives for understanding and managing this turnover issue.

In addition to the ideas espoused through the attitudinal model, the spill-over model, the organizational-factors model, the unfolding model, and the job embeddedness model, contemporary ideas have emerged surrounding employee empowerment and employee engagement as key motivational strategies that can be used successfully to manage voluntary turnover.

The empowerment of employees could help to keep them motivated to stay with their organization. When employees are empowered, managers delegate more decisions to their subordinates, employees have increased responsibility and managers act like coaches. This empowerment acts as a mechanism to provide employees with opportunities to take control of their performance and motivates them to stay. However, employee empowerment has been shown to be a better motivator of keeping employees with their organization within the private sector where empowerment initiatives are comparatively stronger compared to the hierarchical control structure typical of most public sector organizations. Further, not all employees respond positively to empowerment. Some employees are motivated to stay with organizations where control is exercised and directions are provided; that is, where they are less empowered.

Employees who are engaged in their organization are more dedicated, are absorbed in their job, and are invigorated by their work. Dedication describes an employee's sense of enthusiasm, inspiration, and pride in relation to their job; absorption describes the state of being fully concentrated and deeply engrossed in one's work and; vigor describes an employee's energy level, their mental resilience while working, their willingness to invest effort in their work, and their persistence in the face of difficulties. Employees who are engaged are more likely to be invested in their jobs and hence are less likely to voluntarily leave their organization of employment. Most of the suggestions on employee engagement and its relationship to organizational outcomes such as voluntary turnover, however, come from the practitioner literature and consulting firms with a dearth of research within the academic literature. Much more research must be done to provide

empirical support for the suggested relationship between engagement and voluntary turnover within the public sector in particular.

## Conclusions

Researchers have long been interested in the issue of organizational turnover as evidenced by the plethora of studies, which have attempted over the years to shed light on this issue. Within the public sector, it is widely argued that its very structure supports the notion of job security (Swailes and Al Fahdi 2011). As such, the contention exists that organizational turnover may not be an issue of concern for public sector employees. Notably, though, at the highest organizational levels, voluntary turnover in particular has emerged as a costly issue of concern for public sector executives worldwide. In this context, the management of voluntary turnover becomes important.

Over the past few decades, researchers have focused on developing answers to the question of why employees' voluntarily leave their organization of employment where they enjoy security of tenure. Indeed, voluntary turnover must be addressed if managers are to be in a position to retain employees in their organization and to enhance their competitiveness in this world of globalization. Managers must understand that employees in their organizations should be treated as assets of the organization and that keeping talented employees that add value is important for their very existence.

All perspectives that emerged over time to develop answers on voluntary turnover each recognized that managers should examine the sources of employee turnover and to manage this issue based on the sources. The earlier approaches which focused on employee attitudes (job satisfaction, organizational commitment) and job searches/the availability of job alternatives have been shown to be significant predictors of why employees may voluntarily leave their organization, but weak predictors at that. The spill-over and organizational-factors models provided comparatively stronger approaches for managing turnover citing that both off-the-job and on-the-job factors are important in the management of turnover. The unfolding model of voluntary turnover showed that employees can still leave regardless of their satisfaction, commitment, and job searches due to shocks over time. This model brought to the fore the shortcomings of the classical attitudinal models of voluntary turnover. The job embeddedness approach combined with the contemporary ideas of employee empowerment and employee engagement together provided the most compelling suggestions for managing voluntary turnover till date, compared to all other models by actually specifying on-the-job and off-the-job components and dimensions (fit, links, and sacrifices) that tie employees to their organization, thereby reducing voluntary turnover.

Yes, the effective management of turnover has long been a crucial issue for organizations. Yes, many approaches have been proposed and used with varying degrees of effectiveness in explaining voluntary turnover and its management as discussed here. However, it is expected that for an issue that had held the interest of researchers and practitioners for decades, the search will continue building on the existing approaches and perspectives to provide even more answers to understand organizational turnover and to support its management.

# Organizational Values

Emily Kay Hanks and James Craig Hanks
Texas State University, San Marcos, TX, USA

## Synonyms

Core Values; Organizational beliefs; Organizational ethics

## Definition

Organizational values are guiding principles or ideas in any organization shaping both internal practices and relationships with external stakeholders. These principles or ideas might be explicit as in a mission statement or implicit as enacted in day-to-day practices.

## Introduction

The purpose of this entry is to provide an overview of organizational values by exploring the question "What does it mean to say that an organization has values?" In so doing, it addresses the status of organizations as moral agents – that is whether or not it is appropriate to speak of organizational values at all – by surveying applicable US Supreme Court cases and recent theoretical work. Next, several common perspectives on the meaning of values in an organizational context are presented, and a discussion of how organizational values are manifested by explicit espousals and embedded in the enactment of organizational policies and procedures follows. In attempting to present a concise overview of the voluminous literature on organizational values, some aspects of the topic are, no doubt, overlooked or given scant attention. Hopefully, what readers might find lacking in detail is adequately compensated for by the scope of the entry and that it serves not only as a helpful introduction to organizational values but also as a springboard for future research.

## What Does It Mean to Say That Organizations Have Values?

It seems reasonable to claim that individuals have values, such as the ethical values, political values, and aesthetic values, present in making decisions about how to treat people, how to vote, or what sorts of music or art one enjoys. But, conventional wisdom has long held, organizations are merely groups of people, and whatever values are present belong to those individuals. Yet, in 1993, *Fortune* magazine reported that over half of all companies in the USA had statements of corporate values.

One reason that values are often understood as something possessed by individuals and not organizations is that the term "value" is often understood as designating "moral values." And moral values are often thought of as something individuals have and that they adhere to more or less well. Another reason that values are often thought of as belonging to individuals is that individuals are considered moral agents, capable of being morally responsible and deserving moral praise or blame. Individuals are typically thought of as being causally and morally responsible only insofar as they are capable of free reasoning, deciding, and acting. These ideas are perhaps most famously articulated by Aristotle, Kant, and Mill, each of which maintains that the possibility of being morally responsible rests on the capacities to reason and to act autonomously (or voluntarily). Similarly, Max Weber argued that groups cannot think or

form the intentions necessary to be moral agents. These theoretical and commonsense views that groups are not moral agents (and hence not possessing or enacting moral values) are challenged by a history of Supreme Court cases in the USA and recent theoretical work on organizations as moral agents.

In the context of US constitutional law, rights of persons as outlined in the Constitution are fundamental, and of special importance are those outlined in the Bill of Rights and other constitutional amendments. Since the beginning of the nineteenth century, the court has found that the 1st, 4th, 5th, and 14th amendments apply to corporations as citizens and as persons. Corporations take many forms, for-profit and nonprofit, private or public, and local and multinational. Considered as a person, corporations are moral actors, capable of doing good or ill, and reasonably understood as both possessing and enacting values.

In 1809, the Supreme Court issued a ruling in The Louisville, Cincinnati, and Charleston Railroad Company, Plaintiffs in Error, v. Thomas W. Letson, Defendant, 43 US, 497, on the questions of whether corporations could be sued or otherwise held accountable by the courts and if so which courts would have jurisdiction. The court ruled that a corporation is a legal citizen of the state in which it is incorporated. The notion of corporations as citizens was later expanded to the idea that corporations are persons in Santa Clara County v. Southern Pacific Railroad Company, 1886, 118 US, 294. Beginning in 1897, the Supreme Court would site Santa Clara as establishing that the 14th Amendment applied to corporations.

The twentieth century saw the court further expand the understanding of corporations as persons. In Hale v. Henkel, 1906, the court ruled that the Fourth Amendment of the US Constitution protects corporations against unreasonable searches and seizures. Going further in Russian Volunteer Fleet v. United States, 1931, the court ruled that the Fifth Amendment protects foreign, as well as domestic, corporations against unlawful government seizures.

More recently, in a pair of rulings, the court found that corporations have religious rights and rights to protected political speech. In 2010, the court ruled in a case challenging a controversial law regulating money spent on political advertising. In Citizens United v. FEC, the court found that the state may not legally restrict corporate spending on political speech. And, in 2014, ruling in Burwell v. Hobby Lobby, the majority decision argued that certain for-profit corporations count as persons under the Religious Freedom Restoration Act (1993) and granted closely held for-profit corporations an exemption from laws that violate the religious beliefs and values of shareholders.

The history of court rulings in the USA has been one of expanding the ways that corporations are considered legal actors or agents. This has meant both expanding notions of liability and responsibility and also expanding notions of rights. Recent theoretical work takes a slightly different approach. Instead of reifying corporate personhood, scholars sought to establish organizations as moral agents by articulating the relationships between the organization and its members.

Philosopher Joel Feinberg (1968) published a taxonomy of collective responsibility that identifies four different forms of the relationship between members and organizations and is an important step in developing a view of organizations as agents. The two axes of his account are (1) whether all members share the same fault and (2) whether members contribute to harm at the same, or different, levels. First, a group might be held morally responsible if some, but not all of its members are. This might be the case in situations where there is significant group solidarity and in which goods and harms are understood as collective. For example, a team in a competition could be penalized for the actions of one or more, but not all, members. Second, a group might be responsible if all members carry either contributory or noncontributory fault. This category draws on notions of character and moral luck. Imagine a group of friends all participating in a celebratory night of drinking before then each driving an individual vehicle. All participants are liable for faulty character, even if only one, or some, suffers the bad luck of causing harm. Third, a group might be responsible if all members bear

contributory fault. This category covers many sorts of groups that fall short of the highly formal levels of organization found in corporations and in which responsibility might be apportioned based on levels of contribution. Consider global climate change. All residents in industrialized countries (and beyond) are contributing, and the fault plausibly rests both with the society (at the group level) and the individuals that comprise the societies. Fourth, groups can be responsible in cases of collective nondistributory fault. Consider, as an example, an academic department that accepts a graduate student with a promise to supervise the student's graduate thesis. During the student's time in the department, the faculty members who were willing to serve as supervisors leave the department. The department might reasonably be understood as still having the responsibility to find a thesis supervisor, even if no current individual member is responsible for the problem.

Peter French (1979) published a significant and oft-cited article defending the view that a certain sort of group, a corporation, can be, and in many cases should be, considered a moral person. While many sorts of groups exhibit intentionality in their actions, he argued that corporations are a distinctive type of group because of their distinctive modes of governance and decision-making. These allow for a rationality and revisability about intentions and actions, similar to that necessary for individual agents. French distinguished between aggregate collectives (such as a crowd) and conglomerate collectives. He argued that insofar as the latter have internal decision-making structures and are capable of planning, they are reasonably considered moral persons. These include corporations, universities, churches, and other formally organized groups.

More recently, List and Petit (2011) develop a functionalist account of moral agency. They argue that insofar as organizations develop plans about how some aspect of the world should be and then act to bring about change in the world in accordance with these plans, then organizations are functionally similar to individual agents. They go further and make the case that because organizations can face morally significant choices, evaluate those choices, and then act in response to those evaluations, then organizations share the relevant functional characteristics with individual moral agents and should be treated as such.

In their article "Organizations and Moral Agents," published in this encyclopedia, Tholen and de Vries survey the literature on organizations as moral agents and conclude that some organizations are functionally similar to individual human moral agents. They continue to claim that considering some organizations as moral agents in some contexts could have a salutary impact on our moral practice. Making the case that it is difficult to think of organizations as having moral worth in the same way as individuals, it is important to identify, analyze, and justify the differences in rights and status held by individuals and organizations.

## Perspectives on Organizational Values

Yet, the question "What does it mean to say that organizations have values?" is asking about more than the complicated but relatively narrow issue of moral responsibility. Values "talk" proliferates in both scholarly and popular publications on organizations. Discussants include scholars from multiple academic disciplines and practitioners in fields such as public administration, business consultants, and cultural critics (to name just a few). It is possible to highlight three common perspectives on the meaning of values in an organizational context:

1. *Values are a means to achieving competitive advantage*. This might also be labeled an instrumental approach that is concerned with how organizations, in general, and managers, in particular, can use values to accomplish organizational objectives.
2. *Values have relatively little meaning*. No doubt that this cynicism is, at least in part, a reaction to the preponderance of literature in the first group, which, according to Jonsen et al. (2015), touched off a global management fad that resulted in the expectation that all organizations articulate and advertise their values. Yet because documents such as mission

statements oftentimes appear to say the same thing (who is against quality, for instance?) and are comprised of vague abstractions and the link between what a company says and what it does is often tenuous, organizational values are dismissed as "mere talk."

3. *Values are constitutive*. Values talk is not ancillary to the organization (e.g., added to improve performance or included on the company's logo), rather such discourse is generative. Put differently, it is the organization. This is a distinctly communication-centric perspective on understanding organizational values and draws on the view of organizations as constituted by communicative practices (Brummans et al. 2014). Koschmann and McDonald (2015) summarize the approach thusly: "organizations exist as communication and key organizational realities are best understood as communicative phenomena" (p. 234). It is possible to understand values not as something that organizations "have," rather organizations are created, maintained, and negotiated through the discourse of values.

The role of values in organizational life, as the diversity of these perspectives indicates, is contested. Nonetheless there is widespread agreement that values cannot be seen or heard. Because values are never subject to direct observation; they are only made visible when attached to a value manifestation. Where, then, are organizational values located? Fundamentally, these things called values are made manifest in words and deeds, that is, by espousal and enactment (Cheney 1999).

## Espoused Values

Jonsen et al. (2015) define espoused values as "the values a person or organization expresses or publishes in some manner" (p. 333). The espoused values of an organization are often articulated in various documents, goal and value statements, and policies of any organization. One of the best places to look for the explicit espoused values of any organization is the mission or goal statement. Development and dissemination of these documents is a standard and widespread practice – so much so that the work that these texts perform is at risk of being overlooked. These statements serve multiple functions. They can be used to motive and inspire, as in Patagonia's mission statement, "Build the best product, cause no unnecessary harm, use business to inspire and implement solutions to the environmental crisis," or to telegraph expectations and provide cues regarding current/future desired behavior, as in Google's post-2015 statement that the organization's mission is to "organize the world's information and make it universally accessible and useful." Interestingly, this statement represents a significant revision from the values espoused in Google's pre-2015 motto "don't be evil."

Espoused values also function to materialize the organization. Artifacts such as organizational value statements make the organization seem real by presenting us with a unified sense of the organization through a process known as "presentification" (Koschmann and McDonald 2015). Similarly, Jonsen et al. (2015) demonstrate that value statements can be read as a form of organizational self-presentation. Using the metaphor of the stage, they understand the importance of values in general and the articulation of values in particular, as a representation of organizational performance. A good example in this case is the Core Values and Heritage of the Marriott Corporation, which declares: "Our core values make us who we are."

Organizations espouse values in documents other than mission or goal statements. Ethics statements and codes of conduct are also important instances of written articulations of the ethical expectations and values of an organization and provide guidance for its members/employees. Although over 75% of US-based businesses now have codes of conduct/ethics, they are a relatively recent phenomenon, with most being written since 1970. These statements speak simultaneously to internal and external audiences. Internal to the organization, they play both instrumental and constitutive roles by articulating the ethical values and norms expected for individuals and for the organization. Externally, they help

those who might interact with the organization to know what sorts of behavior it is reasonable to expect. Ethics statements also serve a publicity function and a legitimating function insofar as they communicate the ethical aspirations and values for an organization. Some scholars view codes of conduct/ethics cynically, arguing that these statements primarily serve to coerce and/or control organizational members while enhancing and/or protecting the organization's external status.

More recently – especially since the 1987 United Nations report "Our Common Future" and the 1992 Rio Conference on Environment and Development – corporations also began to develop statements on sustainability and to issue sustainability reports. Environmental reports were first released in the 1980s by chemical companies in response to increased public awareness of environmental toxins and EPA Superfund sites. In 2010, the Securities and Exchange Commission promulgated formal guidelines requiring US companies to disclose to investors the possible risks they might face because of climate change. A KPMG global survey of corporate social responsibility in 2013 found that 43% of the world's 4100 largest companies issued sustainability reports. As with codes of ethics and conduct, these statements communicate/construct differing values, from valuing nonhuman nature or animals to protecting profits in a changing world. While businesses across all sectors are adopting sustainability statements, they are implementing them quite differently.

Organizational values are also espoused in procedure and process statements, which are often regarded as merely technical implementation statements. Consider, for example, human resource policies providing guidance on the hiring and treatment of employees. Such documents specify practices governing the solicitation and review of employment applications, leave and vacation policies, wage levels and promotion paths, among other things. Some of these policies clearly articulate values, as when an organization aspires to greater diversity or has no diversity policy at all. Other policies are often simply understood as setting the parameters for employee behavior and corporate actions, specifying the rate of accumulation of sick days, or determining whether or not there will be annual cost-of-living wage increases. However, such statements are not neutral guidelines; rather they articulate what the corporation or society writ large values about the issue in question. Differences in the number of vacation days among countries in the Organization for Economic Co-operation and Development (OECD) are another example. European countries, Australia, and New Zealand all establish legal rights to at least 20 paid vacation days each year and paid holidays, while 23% of US workers have no paid vacation, and 24% have no paid holidays. Far from being technical, value-neutral specifications of how to account for days worked and days off and policies regarding holidays or vacation time express what the organization and society value in work-life balance. Andrew Feenberg's recent work on technical codes in engineering and technology informs our understanding of how codes and policies are the product of value contests and directs our attention to how seemingly neutral procedural specifications reveal much about what an organization values.

Verbal or written statements and formal documents such as policies and procedures typically reflect the officially sanctioned views of top management, and the ability to establish and promote the organization's values is considered by some to be an essential function of the executive. This can be especially true of charismatic leaders in entrepreneurial organizations. Top management may articulate values in an attempt to differentiate and delineate their organization from others in a crowded field, to appear the cutting edge, and, thus, to gain competitive advantage (Jonsen et al. 2015). However, the force of institutions exerts a considerable pull. The values that are espoused by organizations tend to conform to the reigning cultural milieu and reflect the prevailing values of the institutional field.

Different sectors of modern societies are typically understood as fulfilling different roles, as pursuing different ends, and being governed by different values. This is one of the distinguishing characteristics of modern differentiated societies.

Organizations within modern societies are thus shaped by, and expected to live up to, value expectations appropriate to the type of organization – namely, as befitting the for-profit, not-for-profit, or public sector.

In the anglophone world, the dominant view of the appropriate ends and values of for-profit businesses is most succinctly captured by (Milton Friedman 1970). He wrote that "There is one and only one social responsibility of business – to use its resources and engage in activities designed to increase its profits." Friedman argued that when a for-profit corporation pursues any ends other than the increase of profits, it will tend toward a totalitarian imposition of values. Together with the additional specification that for-profit businesses play by the rules (avoid fraud and deception), this view came to be known as the Friedman Doctrine. It is a widely held view, which some trace as far back as Adam Smith's *The Wealth of Nations*, and that is frequently depicted in popular culture (consider the movies Wall Street and The Wolf of Wall Street).

An alternate view of the appropriate values of for-profit organizations is the corporate social responsibility (CSR) movement. There are many versions of CSR, but the overarching idea is that for-profit corporations ought appropriately be concerned with values and goals other than maximizing profits for shareholders. Although CSR came to be an important part of debates about the roles of corporations only during the latter half of the twentieth century (Carroll 1999), the idea that for-profit businesses should be concerned with social well-being can be traced to the Puritan idea that we have an obligation of stewardship and the nineteenth-century "gospel of wealth," which was widely proclaimed by the industrialist Andrew Carnegie. In more recent years, the rise of "ethical consumerism" has framed the pursuit of profits and the pursuit of social responsibility as compatible. Fourteen European Union countries have public policies that encourage or require CSR. Additionally, crises, such as global climate change, have increase pressure on for-profit corporations to expand their traditional frame for what counts as profitable and for the appropriate values of the sector.

Public organizations occupy a second sector in modern differentiated societies and have typically been expected to adhere to a different set of values than either for-profit or nonprofit organizations. These sector appropriate values have been conceptualized as "public values." While acknowledging that there is significant ambiguity with the concept of "public values," Reynaers (2014) identifies a set of values that appear most often in the literature. Public values include transparency and quality, solidarity and accountability, and responsiveness and responsibility. As with nonprofit organizations, public sector organizations have faced pressures to adopt a more instrumental and managerial approach governed by the value of efficiency. Further, movements, such as reinventing government (Osborne 1993) and New Public Management, have guided the dismantling of public organizations and the contracting out of public services to private organizations, both for-profit and nonprofit.

Nonprofit and voluntary organizations occupy a space commonly referred to as the third sector. The separation from government and for-profit businesses is premised on the notion that nonprofits adhere to a distinctive set of values. These values include altruism, trust, and collectiveness, and nonprofit organizations are presumed to act in ways consistent with the values of caring, enriching, and empowering (Salamon et al. 2012). This assumption led practitioners and researchers to suggest that nonprofit groups enjoy a special ideological privilege, which exempts them from some of the pressures considered appropriate to the for-profit sector and provides a nonprofit-specific source of competitive advantage (Helmig et al. 2015). As of late, however, the sector's privileged status has been challenged. Nonprofit organizations face increasing pressure to import values and practices associated with for-profit businesses – efficiency being the first and foremost – and what was once considered their unique value set has been subject to question (Balanoff 2013). No longer can we assume that nonprofit organizations are subject to one set of

values; they too are now governed by multiple goals and expectations (Helmig et al. 2015).

Recent work by Helmig et al. (2015) captures this reality. Their study compares the value priorities (values that are prized and most likely to be espoused by top managers) and implemented values (values embedded within the organization and affecting the process and structure of daily work) of nonprofit organizations to other ownership models. The results are striking; they find no significant differences in value prioritization between secular nonprofit, for-profit, and public organizations nor could they support the long-held claim that "certain nonprofit values are significantly more strongly implemented in nonprofit organizations" (p. 2571). In other words, there was no evidence to suggest a unique nonprofit value system. Their findings present a rich site for further exploration of the interplay between values and processes. As Jonsen et al. (2015) point out, most research focuses on values guiding action, but it could be that "action and reinterpretation guide the values processes, and thus potentially bring the espoused values in line with what is actually lived over time" (p. 338).

## Enacted Values

Organizational values are located in both what an organization says and what an organization does. Organizations enact their values through the actions they take. These actions might be consistent with expressed values, as when Staples worked with HP to reduce e-waste from all sources in keeping with their increased corporate emphasis on sustainability or when Marriott was recognized in 2016 for the tenth straight year as one of the world's most ethical companies by the Ethisphere Institute in keeping with its claim that "How we do business is as important as the business we do." Conversely, actions might not be consistent with espoused claims, as when the 2010 explosion of BP's Deep Water Horizon oil drilling platform and subsequent oil spill in the Gulf of Mexico stood in stark contradiction to BP's explicit goal of being an innovative and environmentally friendly energy company.

The actions taken by organizations have both material and symbolic impact. The material impact of the action can support or contradict the relevant explicit value. The action taken either communicates that the organization is a consistent actor or suggests that in reality the organization follows a quite different value than that stated. Some argue that the values implicit in the actions taken are the actual values and the explicit but not enacted values are thus articulations of self-deception or bad faith. On this view, what an organization does, the impact of its actions, should be the focus of analysis for identifying the values of the organization. Similarly, one might look at the values expressed through how an organization's actions support or challenge existing social structures and tendencies. For example, a nonprofit healthcare group that accepts contracts from a state health department to provide mental health services is simultaneously enacting values related to providing access to healthcare and values related to creating the hollow state. In this instance, the nonprofit is, in part, enacting values of public service, while also enacting, in part, values of diminishing the role and the legitimacy of the state (Milward and Provan 2000).

Because enacted values can be embedded in organizational behaviors and routines and expressed in symbolic interactions such as organizational rituals, enacted values can be thought of as indistinguishable from organizational culture. From this perspective, leadership is able to espouse the values of an organization, which are accepted by members and then eventually internalized and thus "create" an organization's culture. This is consistent with an instrumental or managerial approach to organizational culture that links values and performance. The idea being that if an organizational culture can be created that enacts certain values, values that will further the goals of the organization, then the organization is more likely to be successful in realizing those goals. Efforts to engineer a strong organizational culture can be a source of motivation and empowerment for employees

(Cheney 1999). Yet it is equally likely that to be experienced as a form of control as epitomized by the maxim often attributed to management guru Peter Drucker that "culture eats strategy for lunch."

Finally, organizational values are also enacted by practice. A practice is comprised of shared understandings, rules, and acceptable ends that are inherently tied to context such that all factors are mutually defined through the relationships. Put differently, values emerge through the interactions of what people say and do and their context. For example, there are 759 full members of the Association for the Advancement of Sustainability in Higher Education (AASHE). One of the strategies advocated for reducing energy consumption and carbon footprint on residential campuses is to supply drying racks in residence halls. Doing so is a practice likely to be consistent with espouse sustainability goals at member colleges and universities. However, none of those factors, singly or together – values statements, membership in a relevant organization, and material practices – will ensure that students use the drying racks. For humans to act in particular ways, especially if those actions run counter to existing norms of behavior or demand more emotional, psychological, mental, or moral effort than other options, requires either a particular individual character or an organizational culture that supports the action in question. As we have known, at least since Aristotle, the actions of individuals and the character of the culture they comprise are inextricable intertwined.

## Conclusion

In summary, this entry sought to provide an overview of organizational values by exploring the question "What does it mean to say that an organization has values?" Doing so required first addressing the status of organizations as moral agents – that is whether or not it is appropriate to speak of organizational values at all. After concluding that the history of US Supreme Court cases and recent theoretical work warranted further consideration of the question, several common perspectives on the meaning of values in an organizational context were highlighted followed by examples of how organizational values are manifested by explicit espousals and embedded in the enactment of organizational policies and procedures.

## Definition

Organizations – groupings of people in society that come together for specific purposes – have an impact on the natural environment and the natural environment, in turn, influences organizations.

## Introduction

Human society profoundly shapes the natural environment. We harvest natural resources, build elaborate urban settings, and deposit waste from economic processes back into nature. These processes produce deforestation, pollution, reduce biodiversity, and transform ecosystems. While it is common knowledge that human society influences nature, the converse is also true. The biophysical world shapes human society. Poverty and abundance, family and industry, are impacted by the landscape, stocks of natural resources, and weather. Human settlements follow the contours of watersheds. Economies are differently endowed with natural resource riches. At its core, the scholarship of organizational and environmental studies is concerned with this reciprocal interplay between human society and nature.

When we speak of human organizations we mean something a bit narrower than society. Organizations are companies, governments and other major subsocietal bureaucratic endeavors. Organizational studies – made up of organizational sociology and management studies – is the study of bureaucracy, governance, and management of human organizations.

We live in a moment of environmental crisis. Climate change, resource scarcity, and "natural" disaster have come to characterize the global environment of the twenty-first century. It is more urgent than ever, therefore, to understand the interplay of organization and environment. This article lays out the chief intersections of organizational studies and environmental social science. In the next section, we discuss the central concepts in the field of organizational studies and the relevance of these concepts for environmental concerns. In the third and fourth sections, we hone in on the two most salient points of intersection for organizational and environmental studies – sustainable development and climate change.

## Organizational Theory and the Environment

Organizational theory has been in fluctuation since its beginning. A variety of disciplines – from economics to business management to engineering – have made use of the concepts of organizational theory, each with their own unique application.

Organizational theory has its roots in the work of sociologist, Max Weber (1946), who, interested in the architecture of the modern capitalist economy, focused on the multidimensional intersections of social classes, status groups, and political parties. For Weber, these three dimensions were intricately attached to capitalism and operated within an organizational structure that both relied

on and prolonged their specialized roles. Weber aligned the development of capitalism, and the subsequent division of labor, along with the development of bureaucracies and bureaucratization.

For Weber (1946), a bureaucracy is a closed hierarchy of levels of graded authority which create a system of super- and subordination. This hierarchy coincides with the money economy. The increased bureaucratization of capitalist economies – or rational delineation of specialized activities and actions – matches the accumulation of goods and capital. These processes, then, create social class divisions. This set of concepts overlaps with Emile Durkheim's (1972: 143) notion of organic solidarity, where individuals in society become "co-ordinated and subordinated one to another around the same central organ which exercises a moderating action over the rest of the organism."

Weber's bureaucracy is still the basis for modern organizational sociologists' ideas about organizations, firms, and institutions. Yet, important contemporary departures from classical organizational sociology have emerged.

The first of these contemporary currents in organizational theory is a movement away from conceiving organizations as closed systems toward seeing them as open systems. Weber defined organizations as closed social relations with access granted only to specific individuals by a chief or director and an administrative staff (Scott 2004). However, contemporary organizations have more permeable, less fixed boundaries. For example, permanent workers have now been joined, sometimes even replaced, by temporary, part-time, and contract employees. Teams and project groups often include members from multiple independent firms, and organizations downsize and/or work with partners and competitors (Kanter et al. 1992). Similarly, production and service systems now extend across networks of independent companies and agencies.

The notion of externalization is similar to that of organizations and open systems. Classic organizational response to challenges (e.g., workers, technology, expertise) was to absorb and therefore mitigate these challenges by incorporating them into the bureaucracy. However, modern organizational sociologists observe a process of externalization whereby organizations dispose of internal units and contract out functions that were formerly performed in-house (Scott 2004). Along with the move toward open, flexible organizations comes a move toward horizontal systems of management as a complement to the traditional vertical systems.

These new characteristics of organizations hold implications for the natural environment. First the consolidation of bureaucracy as described by Weber ushered in the era of industrial and capitalist excess and the rise of the city in the early twentieth century, which began society's dependence on fossil fuels. This era of assembly lines and growing income disparities turned citizens into consumers and alienated workers. All of these qualities of twentieth century capitalism came part and parcel with environmental degradation. The sooty center cities of the mid-twentieth century and the minority groups that populated them comprised the first real cases of environmental injustice. Organizational theory, therefore, came of age in a moment and described a set of conditions that set society on the path to the acute environmental crisis.

The move in the late twentieth century toward open, flexible firms characterized by outsourcing and short-term contract work weakened organized labor and set the stage for the growth of precarious work. Organizations tend to pursue collective goals at the expense of individual goals (Coleman 1974). But the late twentieth century intensified the anomie experienced by individual workers. Scott (2004: 10) describes this phenomena writing, "rather than organizations serving as agents under our control to assist us in pursuing our goals, we more often spend time and energy serving as agents of organizations as they pursue their specialized and limited ends."

Technological innovations that came bundled with the advent of industrial capitalism (e.g., nuclear power, the medicalization of health, air travel, etc.) produce important social benefits but also represent serious risks. Organizational sociologists introduced the idea of "normal accidents" to explain these developments and their negative consequences (Perrow 1984). Perrow (1984)

argues that the complexity and interdependence of parts is so sensitive that accidents must be expected. Modern society is a risk society where organizational breakdowns become common occurrences. Society employs advanced technologies to clean up or mitigate the risk of future disasters, which, in turn, introduces new sets of risks (Beck 1992).

A final consequence of the rise of the firm, vis-à-vis the natural environment, is the implication of decentralized management and silos of expertise for the system knowledge and application necessary to treat environmental problems. When no one limb of a firm knows what the other limbs are doing, holding companies accountable becomes difficult. Decentralized management allows firms to claim ignorance regarding ethical, environmental, and labor problems. See Dougherty (2015) as an example of this in the context of corruption in the mining industry.

## Organizations and Sustainable Development

International organizations of governance, to a large extent, have established the contours of environmental discourse in the late twentieth and early twenty-first centuries. The predominant environmental discourse today is that of sustainability and sustainable development – a discourse which seeks to preserve capitalist production and consumption and places human life quality at the center.

Sustainable development as a concept originated with efforts of the United Nations in the 1980s to address both environmental degradation and underdevelopment in the global south. The United Nations' World Commission of Environment and Development, commonly known as the Brundtland Commission, took place in 1983. In 1987, the published report of that meeting, *Our Common Future*, introduced the sustainable development model as a solution to several global problems including food insecurity, uneven growth, and energy and resource scarcity. *Our Common Future* coined the definition of sustainable development, still in wide use today: development that meets the needs of the present without compromising the ability of future generations to meet their own needs.

The Bruntland Commission laid the foundation for the 1992 Earth Summit in Rio de Janeiro, formally known as the United Nations Conference on Environment and Development. This meeting established specific mechanisms to achieve sustainable development. One major outcome was the Rio Declaration on Environment and Development, which laid out the Rio Principles as guidelines for sustainable development. The Rio Declaration shifted the discourse around solving environmental problems from one of government regulation to one of market forces. This gave further momentum to the concept of sustainability, rendering it the dominant environmental discourse of the twenty-first century.

Twenty years after the original Earth Summit, in 2012, the United Nations hosted a follow-up conference entitled, Rio + 20. Like the previous meetings, this meeting was oriented towards market mechanisms to solve environmental problems, arguing that economic growth itself is the solution to environmental degradation.

Sustainable development appeals widely across the political spectrum, given its understanding of environmental stewardship and economic growth as codependent. The term "sustainable," as a result, is used to mean many different things and has become quite diluted in the process. As is pointed out by Humphrey, Lewis, and Buttel (2002: 224) no politician has ever claimed to be in support of "unsustainable development."

Economist Herman Daly (2003) offers a more precise definition for sustainable development as an alternative to the United Nations standard-bearer. Daly suggests that when the stocks of resources extracted from nature and introduced into the economy are replenished, in like or greater proportion, we have achieved sustainability. He calls this the throughput definition – where outputs equal inputs. Where the United Nations definition takes human society as the focal point, the throughput definition takes the biophysical world as the centerpiece.

Corporations are aware of the contradictions between management and environmental goals. Organizations approach such contradictions from varying perspectives (Van der Byl and Slawinski 2015). Some suggest that there are "win-win" arrangements in which organizations can promote sustainability and profit through green consumerism and green production. This approach is embodied in policy circles by the notion of the "green collar economy" (Jones 2008) and in the scholarly literature by ecological modernization theory (Mol 2003). Other companies see this contradiction as a set of tradeoffs or zero-sum choices (Van der Byl and Slawinski 2015).

Sustainability has become a buzzword in organizational and management studies to refer to practices designed to achieve organizational health and growth. This literature is often divorced from the environmental dimensions of sustainability. Organizations are rightly concerned with efficient use of resources as an integral dimension of organizational sustainability, but more often than not environmental costs are externalized and not captured in this accounting. For organizations to move closer to achieving sustainability in throughput terms, they must begin to internalize these environmental costs.

## Organizations and Climate Change

The dawn of the modern corporation at the turn of the twentieth century institutionalized rational, utility-maximizing logic (Linnenluecke and Griffiths 2015). This rise of the firm and the organization and the concomitant intensified resource use has led to dramatic increases in greenhouse gas emissions and the unequal distribution of the costs and burdens of the effects of these emissions (Linnenluecke and Griffiths 2015). In 2010 alone, commercial and industrial sources in the United States emitted three times the $CO_2$ of residential sources (U.S. Environmental Protection Agency 2016). As a recent Intergovernmental Panel on Climate Change (IPCC) report warned, the increasing magnitudes of warming exacerbate the likelihood of severe, pervasive, and irreversible impacts (IPCC 2014). This is emblematic of Ulrich Beck's (1992: 19) warning that "in advanced modernity, the social production wealth is systematically accompanied by the social production of risks."

There is a disconnect also between the prescription for stemming the tide of climate change – individual changes in lifestyle and consumption habits – and the scale on which the inputs and outputs to and from organizational bureaucracies emit greenhouse gases and threaten the global climate. This phenomenon might also be described as a disconnect between "the limits of exponential growth modes and their impacts on natural systems" stemming mostly from their inability to match human actions and ecological timeframes (Linnenluecke and Griffiths 2015). The tendency of modern society is to individualize risks, hazards, and environmental "bads," including climate change. Subsequently, the solutions or mitigation of such risks become individualized (Beck 1992). This characteristic dovetails with the tendency, described in the organizational studies literature, for organizations to externalize responsibilities onto the individual (Scott 2004). Maniates (2001) refers to this as the "individualization of responsibility." In blaming individuals for environmental bads we give organizations a pass when they should be at the forefront of proposing and implementing solutions.

This individualization of responsibility exonerates organizations from responsibility and thus fails to countervail climate change. Climate change, therefore, is a global problem with its roots in the rise of the modern organization. Climate change requires solutions constructed on the same grand scale and according to the same organizational principles as modern organizations. This observation does not make individuals exempt from responsibility for their lifestyle choices but serves to remind us that the most effective efforts to mitigate climate change must come from the organizational level at which the systematic problems originate. Howard-Grenville et al. (2014: 615) petition management and organizational scholars to integrate climate change into their agendas. "Climate change is so pervasive that its causes and consequences show up at every level of analysis of interest to organizational

scholars. . .climate change and responses to it will fundamentally reshape many of the phenomena, interactions, and relationships that are of central concern to management scholars."

## Conclusion

Organizations are agglomerations of humans within society that seek to accomplish specific goals. These can refer to organizations of governance at the local, national, or global level or can refer to private firms either with or without profit motives. Organizations are fundamental to modern human society and are the building block of the global capitalist economy. In this context, organizations to which conserving the biophysical world is external are likely to be in fundamental conflict with environmental goals. This is so despite the galvanized efforts, over the past 20 years, of organizations to support environmental goals through greening production and consumption and through corporate social responsibility programming. These efforts are known as greenwashing – claiming environmental contributions, which do not really exist, for promotional purposes (Lyon and Montgomery 2015).

As organizations move toward becoming ever more flexible and less centrally managed entities, their ability to work on behalf of the biophysical world is further diminished. The notion of sustainability and sustainable development, the dominant environmental discourse today, seeks to reconcile environmentalism with advanced capitalism in defense of consumer culture. This discourse dovetails with organizational goals, broadly construed. To organize society for environmental protection and stave off the adverse impacts of climate change, we must move away from an anthropocentric sustainability discourse toward a biocentric discourse – one with ecosystems at the center. We must also work to convince organizations and their regulatory apparatuses to transform accounting practices and require that firms internalize the environmental costs of production and pass those costs on to the consumer.

## Definition

Globalization – the transcendence of nation state boundaries and governmental authority by an increasingly complex and extensive array of economic, social, cultural, and technology-mediated patterns of human interaction. These patterns encompass material and symbolic modes of exchange.

## Introduction

The globe is connected through a multilevel maze of organizations and organizational agendas, shaped by multiple actors, large and small, public and private. The demand for international cooperation is substantial, and intergovernmental organizations (IGOs) form only one category among many in a global system characterized by increasing plurality (UIA 2015). Estimates of the number of IGOs range from several hundred to several thousand, but, by whichever criteria we use to enumerate these entities, unarguably, the scope of intergovernmental action has widened appreciably since 1945 and with this the scope of political globalization. The chapter reviews the evolution of the United Nations System and affiliated Bretton Woods Institutions (BWIs), to illustrate the role of power structures, discourses, and interests in the formulation of an increasingly plural system of global institutions of governance. Outside the state sphere, the scope for organized action is limitless. Commercial organizations, in production, trade, and finance, move in different patterns and at different tempos to these bureaucratic actors, but the largest shape the course of economic globalization and thus have a substantial bearing upon the integrity of the system as a whole. Between a state and market sits a vast and disaggregated space of social action, which resides social actors that either work to mediate between the global and the local or outright seek to resist the pressures to conform with executive prescriptions.

Forms and models of "organization" have altered substantially over the past half century. Machine-oriented archetypes of hierarchical industrial enterprises have given way to images of dynamic and adaptable ecological systems, configured to operate in a complex global world (Morgan 2006, p. 18). The impacts of these shifts are most evident in the commercial sphere but manifest also in the diversification of governmental and nongovernment actors at the international and global levels. Even for large and "heavy" bureaucracies, such as the major multilateral institutions, it has become the norm to pursue institutional agendas through extensive and multilayered networks of actors. This reflects the "open system" dynamics of globalization in both the opportunities created for coordinated action and the new competitive conditions arising from increasing plurality (Morgan 2006; Battersby 2014). Rather than focus upon "the organization," this chapter explores processes of assemblage and

change within networks of organizations in a complex global environment.

## Intergovernmental Organizations (IGOs)

### The United Nations System

The United Nations Charter (1948) tasks UN member states with the collective maintenance of "international peace and security" through the globalization of complementary norms. Collective security is both a principle and a practice of collective defense, in which parties agree not to make war against each other and to assist when mutual security is threatened from without or within. Written with the memories of World War II still fresh in the minds of all participants at the 1945 San Francisco Conference, the Organization's founding document places security and military cooperation at the top of the international agenda with "economic and social advancement," "tolerance," and respect for human rights counted as security enablers (UN Charter 1945). The UN is not a world government; it has no army, no police force, and no means of enforcing international laws without the consent of the five permanent members (P-5) of the UN Security Council (UNSC), the USA, China, Russia, Britain, and France. It is financially dependent upon member states with the USA its principal and oftentimes reluctant donor. Like its institutional predecessor, the ill-fated League of Nations, the UN is bound to uphold the principle of state sovereignty, which is fundamental to the *raison d'etre* of what is after all an association of nation states and which receives specific protection under the UN Charter (Article 2/7).

The UN is also not a unitary organization but a collection of self-governing programs and funds and independent but affiliated specialized agencies. The secretary-general and the UN General Assembly (UNGA) are technically placed at the apex of the UN's organization structure, but the authority of both is circumscribed by the fact that neither wields effective enforcement power, which resides in the UNSC. Here, the right of veto shared by the P-5 means that the particular interests of each of the permanent members limit the scope of possible actions. Military intervention to end conflicts or prevent mass atrocities can only be effected under international law with UNSC endorsement and requires the political will of larger states, primarily the USA, to provide military forces and financial resources. The willingness of the USA to contribute to international interventions under UN auspices diminished as communism collapsed in the 1990s and waned still further because of its costly twenty-first-century campaigns in Afghanistan and Iraq. After a brief moment of compromise in the early post-Cold War era, relations between the permanent members have become increasingly tense. The failure of the UNSC to act decisively to broker a solution to the civil war which erupted in Syria in 2011 reflected the widening gap between US and Russian models of geostrategic security. Yet, shared mental models on matters of global concern, notably the spread of Islamist terrorism out of the Middle East and global climate change, have enabled the patching over, if not the transcendence, of differences between the major powers.

Global security governance is still dominated by the P-5. In recent times however it has become common to add Germany to this strategic power grouping (the P5 + 1) in recognition of Germany's leadership role within the European Union where it has shaped EU security policy in the European P5, along with France and the departing UK (On June 23, 2016, the United Kingdom resolved through referendum to leave the European Union.). There is a realization within the UN's upper echelons that the twenty-first century demands a different perspective and a different set of operating principles, but deeply entrenched power structures are difficult to reform (Kennedy 2006, pp. 135–136).

If international cooperation is merely the pursuit of political self-interest through diplomatic means, then the lengthening UN agenda since 1945 suggests a broad harmony of interests at the international level, even allowing for disputes over detail. Institutional evolution reflects the lengthening postwar global development agenda and the emergence of new global issues, the environment and global warming, health, and

HIV/AIDS. World War II displaced hundreds of thousands of people across Europe, hence the formation of the United High Commissioner for Refugees (UNHCR) which oversees the implementation of the *1951 Convention Relating to the Status of Refugees*. UN development priorities address the "soft" or human infrastructure of liberal social progress with special emphasis on education and international "understanding." The United Nations Children's Education Fund (UNICEF) exemplifies the UN's aspirational emphasis upon youth as the symbolic and physical embodiment of the future of humankind. Because voting power in the United Nations General Assembly is based on the principle of one nation one vote, developing postcolonial states has played a larger part in shaping institutional arrangements. The United Nations Conference on Trade and Development (UNCTAD) (1965) and the United Nations Development Programme (UNDP) (1966) were formed in response to concerns voiced by states from the global South about the inequities of development which it was claimed perpetuated unequal power relations in the global political economy.

The UN Economic and Social Council (ECOSOC) coordinates the economic and social development work of UN programs and funds and specialized agencies, but its coordination powers are limited by the financial and bureaucratic independence of this latter group of organizations. The United Nations Economic, Social and Cultural Organization (UNESCO), for example, established as a specialized agency in 1945, to foster "moral and intellectual solidarity," has its own governing organs, membership, and budget derived principally from member state contributions (UNESCO 2015). The World Bank and International Monetary Fund (IMF) are likewise autonomous agencies within the UN system with substantially more financial resources at their disposal (Kennedy 2006, pp. 114–117). Viewed positively, these institutions demonstrate common concern for global issues; viewed critically, each agency is merely another opportunity for states to pursue their self-interest by diplomatic means (Table 1) (Weiss 2012).

In the 1990s, global policy makers began to acknowledge the complexity and cross-cutting nature of peace and security issues on the UN agenda. Beyond the strategic security sphere,

global policy has become more "businesslike" and less tolerant of the bureaucratic models of the past, even though patterns of centralized command and control persist. Adopting the language of modern corporate management, former UN Secretary-General Kofi Annan (1996–2006) foreshadowed a new model of global problem solving, one which placed emphasis upon "integration," "policy coherence," "flexibility," and "informational capacity" across government, non-government, and intergovernmental sectors, to address multidimensional and multi-sector security issues (Annan 2000, p. 14). This prescription foreshadowed a new spirit of entrepreneurialism in international responses to global challenges framed in the eight Millennium Development Goals (MDGs), superseded by 17 SDGs, which incorporate stronger statements on climate change and wealth inequality (For official details of the MDGs, see http://www.un.org/millenniumgoals/; for the SDGs, see http://www.un.org/sustainabledevelopment/sustainable-development-goals/.). Notions of complexity and multiplicity are embedded in new inventories of development, which are themselves exemplars of the increasing complexities of the global system (UN 2012).

While the UN development agenda accord a significant role to the state in providing necessary social investments, the ideology of market multilateralism has gained the ascendancy. Emblematic of this new business-friendly attitude is the UN Global Compact, coordinated out of the Secretariat and designed to foster involvement by business organizations and associations in the work of the UN, as project partners. This mode of cooperation coheres around the logic of "shared value," being the proposition that, post-2015, the SDGs are aligned with and complementary to the long-term interests of business (Global Compact and DNV GL 2015; Global Compact 2013; Ruggie 2013). "Neoliberal" models privilege market processes above all other considerations and exert a heavy influence on the framing of UN development programs. The UNDP's core operations echo this new spirit of entrepreneurialism. The organization declares its commitment to a strategy of "inclusive market development" adopting a "shared value" approach to multi-stakeholder engagement (UNDP 2014). UNDP has quickly become a significant procurer of development "services" and "goods," from business consultants to advanced telecommunications equipment, with a purchasing budget of US$3 billion in 2015 (UNDP 2015). In this new policy context, human capability development is human capital development with entrepreneurialism and sustainability heavily accentuated.

## Global Economic Governance

A historical distinction can be drawn between the social development agenda adopted by the UN and the economic orientation of intergovernmental organizations created to govern the world economy. Development thinking within the UN favored an interventionist, state-led model, as set forth in the analytical work of Argentinian economist and senior UN bureaucrat, Raul Prebisch, who held the posts of executive director for ECLAC (1950–1963) and secretary-general of UNCTAD (1964–1969) (Prebisch 1971; Kennedy 2006). The 1944 Bretton Woods Conference, in the US state of New Hampshire, led to the creation three key intergovernmental institutions – unofficially but conventionally grouped together as the Bretton Woods Institutions (BWIs) – tasked with governing the international economy to promote market-oriented economic stability and growth. These are the International Bank for Reconstruction and Development (IBRD), which is today one of five agencies within the World Bank Group; the General Agreement on Tariffs and Trade (GATT), superseded by the World Trade Organization (WTO) in 1995; and the International Monetary Fund (IMF). This institutionalization of global economic governance reflected a consensus among world leaders (and their advisors) there gathered that national regulatory arrangements, which worked effectively to ensure relatively orderly financial markets before World War I, were no longer sufficient to govern complex transnational capital movements (Isard 2005, pp. 24–29). There was also a widespread view that financial volatility and the depression of the 1930s contributed materially to the rise of fascism in Europe and hence to the outbreak of war.

The Agreement, at the insistence of the USA, fell short of the interventionist ideal espoused by Britain's lead negotiator, John Maynard Keynes, and entrenched the USA and the US dollar at the apex of the global financial system (Steil 2013). Strategic priorities set by the BWIs have, understandably, emphasized economic models and priorities, specifically investment in the physical means of development (World Bank), trade liberalization (GATT/WTO), and exchange rate stability (IMF). International trade followed an upward trajectory sustained by trade liberalization through the GATT and the receptiveness of US consumers to cheaper electronic goods and motor vehicles from industrializing East Asia. In the 1970s, the BWIs and national governments had to learn to cope with the end of the international regime of fixed exchange rates underpinned by the US dollar ("dollar convertibility"). Financialization, a form of economic globalization characterized by increasingly sophisticated financial innovation, growing foreign direct investment, and mergers and acquisitions through increasingly powerful global capital markets, heralded a new era of growth with volatility. The response from the IMF and the World Bank was to place the greatest burden of responsibility on developing countries to "balance the books" and adopt economic policies attuned to conventional liberal market theory, irrespective of local circumstances and despite serious local institutional shortcomings. As one former World Bank Country Director reflects, "the international system to support development is not a thing of beauty. It has evolved over the past 60 years in a way that defies logical explanation" (Kavalsky 2005, p. 43).

The so-called "Washington Consensus" became synonymous with neoliberal globalization in the 1990s, denoting a shared, but by no means, uniform, general policy orientation among the BWIs that favors economic deregulation and severe fiscal austerity in times of economic crisis (Rodrik 2011, p. 164; Denzau et al. 2007). Broadly, the shared assumptions were that deep government regulation constrains economic development and creates fiscal imbalances that, in extreme cases, occasion economic collapse. "Free market" competition by contrast enables economic relations to reach a natural equilibrium where economic fortunes fluctuate within an acceptable bandwidth of risk. This orthodoxy, as it became, ran counter to the logic of many economists who see a greater strategic economic role for the state and draw attention to the historical record of the growth creation through strategic industrial protection, exemplified by the successes of East Asian economies in the late twentieth century (Chang 2007, pp. 72–74; Rodrik 2011).

The model was derived, erroneously, from John Williamson's analysis of the causes of the Latin American debt crisis of the previous decade. Yet, Williamson's descriptive findings were not an endorsement of austere structural adjustment policies. His prescriptions did not call for the automatic reduction of government expenditures but rather the careful management of fiscal policy to effect debt reductions where appropriate but without choking the supply of finance essential to engines of economic recovery (Williamson 2004). Williamson sought a consensus about fiscal responsibility not the denial of credit that critics, including some World Bank officials, allege exacerbated the Asian financial crisis of 1997–1998 (Shivakumar 2005, pp. 318–319). There is convincing evidence of the damaging effects of aid and structural adjustment both on the populations of recipient countries, in the form of diminished economic opportunity, and on those decision-making and governance structures which fall prey to corruption by vested interests seeking personal financial gain from the rivers of multilateral cash and credit that flow in their direction (Easterly 2013).

There is intense pressure on national governments to institute reforms that correspond with the global "script" handed down by the BWIs and the World Economic Forum (WEF), as detailed in the latter's annual *Global Competitiveness Report* and Global Competitiveness Index. Both the Report and Index identify "pillars of competitiveness" and rank countries in terms of their performance against key competitiveness indicators, including strength of representative political institutions, market efficiency, health, education, levels of corruption, and more (Sala-i-Martin et al. 2015). "Competitiveness," more so

than stability, is today the defining global economic norm among financial policy elites that subscribe to the orthodox vision of liberal modernization (Rodrik 2011). World Bank strategy has veered markedly toward acknowledgment of the social and psychological dimensions of development and the reality that individual "choice" is often irrational and irregular, meaning that policies based upon notions of uniform human motivation are flawed (Stiglitz et al. 2010). That said, the goal of all BWIs remains to make markets work more efficiently.

Credit (or debt) is fundamental to a liberal economic system that thrives on financial risk taking and the expectation of future returns on investment. Whatever the social and environmental claims made in World Bank official statements, the World Bank Group exists to redirect financial resources in ways that further economic risk taking to (depending upon one's ideological standpoint) spread growth and development or expand the frontiers of liberal capitalism. The Group comprises the International Bank for Reconstruction and Development (IBRD), the International Development Association (IDA), the International Finance Corporation (IFC), the Multilateral Investment Guarantee Agency (MIGA), and the International Centre for Settlement of Investment Disputes (ICSID) (World Bank 2015a). As with the UNSC, the World Bank's 25-member executive reflects the economic strength and financial power of a select group of countries with the USA wielding the most influence by virtue of its financial contributions, the basis upon which voting privileges are allocated, and the requirement that the World Bank President be a US citizen. Unlike the Security Council, the World Bank has adjusted the economic rise of Japan and Germany and in 2012 moved to reallocate voting rights to reflect increased contributions from the BRIC economies – paralleling revised quota and voting provisions adopted by the IMF.

"Flexibility" is the watchword of contemporary neoliberal economic governance. World Bank development models are evolving away from grand-scale donor-driven infrastructure projects toward local "ownership" of planning priorities with the Bank acting as financier and facilitator. The Bank supplies expertise and project finance, through loans, credit facilities, and grants, for the construction of physical infrastructure and the development of new business ventures, but a large share of financial risk is borne by contractors. The significant rise in contracting out to private companies since 2000 is privatizing development, and spreading risk through the development supply chain, down to a local community level (World Bank 2012). The sophisticated means by which finance is marshalled and channeled into development projects and programs imposes demands, the so-called "conditionalities," upon recipient governments to reform public sector management practices and modernize their financial systems to accommodate increased financial flows and more abstract financial transactions. Because World Bank officials endorse the values, if not the methods, espoused in Bank policies, expert advice encourages further market reorientations and the adoption of mental models more attuned to the Bank's market logic (Poortman 2005, pp. 206–210).

It is also possible to plot patterns of financial norm diffusion across the global political economy through the agency, and the agents, of regional multilateral banks, most of which were, until recently, World Bank affiliates. This second tier of financial institutions incorporates the African Development Bank (AfDB), the Asian Development Bank (ADB), and Inter-American Development Bank (IDB). As with the World Bank, regional development banks are funded by member states but supplemented by finance from non-borrowing members in the industrialized Global North (Table 2).

Multilateral finance at the regional level is granted to governments through loans and credit facilities subject to approved economic and social development strategies. Unsurprisingly, the rules by which finance is approved mirror those set out by the World Bank Group. Yet more subtle forms of multilateral regulatory power manifest in the sphere of international financial risk insurance. The International Finance Corporation (IFC) adheres to the World Bank poverty alleviation mantra declaring its mission as one of brokering opportunities "for people to escape poverty and

improve their lives [. . .] by *leveraging our global presence* [emphasis added] and expertise to provide investment and advice that help developing countries achieve long-term, sustainable growth" (IFC 2012, pp. 7–8, 38–39). The 175-member Multilateral Investment Guarantee Agency (MIGA) likewise encourages transnational investments by underwriting contingencies, for example, asset losses, through conflict or government expropriation. Established in the 1980s, when there was a rapid and significant increase in global equity flows, MIGA is a consequence of the increasingly transnational nature of production and investment and the need, within a liberal capitalist system, to price and mitigate financial risk (MIGA 2012, pp. 2–4). These specialized entities still operate within a multilateral system of economic governance that remains highly centralized. Institutionalized power structures are not immutable, and, partly attributable to the inadequacies of global institutions, newer intergovernmental organizations and networks have emerged to fill policy and organizational voids.

## New Global Actors

The preeminent exemplar of regionalism, the European Union (EU), is the latest stage in an experiment in regional cooperation that began with the revival of Europe after the Second World War. A European community of states was foreshadowed in the US-funded Marshall Plan for European reconstruction, European institutions built under the protection of the US and NATO, and an evolutionary trajectory sustained in part by common economic interests and a shared belief that Franco-German cooperation was central to a durable regional peace. European cooperation has evolved far beyond the confines of macroeconomic coordination to accommodate "external actions" that encompass security and development. It is an exemplar of how trade protection can be an effective means of economic and political integration. Expansion of the former European Economic Community in the 1960s was encouraged with a generous Common Agricultural Policy (CAP), which guaranteed prices for farm commodities to secure the "buy-in" from key agrarian constituencies in establishment and new member states. The template for the EU as an economic and monetary union was laid down in the *Maastricht Treaty* of 1992, but the social character and priorities of the Union continental member states were apparent in the common social and environmental provisions contained in this and subsequent key treaties, culminating in the *Treaty of Lisbon* (2007) (Hix and Hoyland 2011, p. 22).

The 27-member institution (Formerly a 28-member union, the UK resolved to withdraw from the EU after a referendum in 2016. Technically, the UK remains a member state until its withdrawal is effected in law.) is a global actor with substantial diplomatic resources at its disposal to purse separate international economic, security, development agendas. The *Treaty of Lisbon* states that the European Union's development cooperation strategy is committed as "its primary objective [to] the reduction and, in the long term, the eradication of poverty" (EU 2007/c 306/1 161a). Development cooperation serves as an instrument of EU soft or "smart" power and is distinguished from humanitarian aid which

forms a central element of the Union's crisis response-oriented Common Security and Defence Policy. Development, aid, and security cooperation sit within the EU's more broadly conceived Common Foreign and Security Policy (CFSP) where their conceptual complementarities become manifestly evident in the alignment with "good governance," human rights, and democracy, which are specified as key to regional and global "stability" (Ashton 2013; EC 2014).

One of the dominant narratives of global economic change in the 1980s and 1990s centered on the apparent "shift" in the locus of global dynamism toward Asia and the Pacific. Global economic restructuring continues despite the 1997 Asian financial crisis, which did not bring the era of rapid Asian industrialization to an abrupt end as some had forecast. Though Japan's economic ascent stalled, China experienced phenomenal economic expansion. Brazil, Russia, India, and China are now commonly grouped with South Africa into the BRICS, representing new centers of regional and global influence in a "post-Western world" (Stuenkel 2015, p. 126). Pressure to reform of voting powers in the World Bank and IMF is intensified by the formation of new multilateral banks, the so-called "BRICS Bank" and the Asian Infrastructure Investment Bank (AIIB). Both constitute alternative sources of development financing independent of established multilateral banking institutions.

The BRICS emergency stabilization fund, the Contingent Reserve Arrangement, is arguably an outgrowth of deep-seated and historical mistrust of the fashionable neoliberal policy prescriptions handed down by IMF (BRICS 2014; AIIB 2015; Baily 2015). The AIIB initiative is driven by China, which holds 26.6% of voting rights, and is yet one more tangible manifestation of the pluralization of global economic governance, if not fragmentation of the global financial system (Sun 2015). The predominance of Middle East and Asian nations in the AIIB reflects that institution's geographic focus but also underscores the growing appetite for South-South and South-North multilateral cooperation, where non-Western states take the lead in setting agendas.

## Networked States

The EU, like the UN, the BWIs, and the BRICS Bank, is comprised of nation states which, as demonstrated by the UK's decision to leave, retain significant scope for independent action, despite being drawn into an ever-broadening array of interlocking multilateral, regional, and bilateral agreements. The sovereign nation state is conventionally defined as a self-governing territorial entity in which supreme legislative and executive power is exercised by a central government. There are an estimated 206 state entities worldwide, but not all are formally recognized. The UN comprises 193 sovereign member states and a further two nonmember states, the Holy See and the State of Palestine, where in the case of the latter, sovereignty and statehood remain in dispute at the time of writing (UN 2015). In global policy discourses, states are often categorized into simple binary opposites defined according to economic, cultural, or political criteria as "developed" and "developing" (a more palatable version of the older "first"- and "third"-world distinction), "industrialized" and "industrializing," "western" and "non-Western," and the Global North and Global South, which connote political as well as economic commonalities. The UN and World Bank rank countries by income category into high, middle, and low, with gradations in between. Then there are least developed countries (formerly classified as "underdeveloped") distinguished by alarmingly low outcomes across most of the key criteria by which development is officially measured (Alonso et al. 2014; World Bank 2015c). In reality, economic outcomes and geoeconomic interests vary substantially within these groupings and are widening further.

The USA pursues its hegemonic interests in a post-hegemonic or multipolar world, which goes some way to explaining the sizeable military component in its foreign aid budget, a consequence of ongoing involvement in Middle East conflicts. Out of a foreign operations and assistance budget of nearly US$42 billion in 2015, only US$15.9 billion was allocated to bilateral aid, while a further US$6.9 billion was spent on security priorities (including US$4.9 billion given to foreign

militaries). The total includes a historically consistent allocation to the World Bank Group, where the USA holds a 16.9% share of World Bank capital. In return, the USA receives 16% of votes at the IBRD and one of the five permanent seats on the World Bank's Boards of Directors granted to the five largest shareholders (US DoS 2015; World Bank 2015d). The Bank's location in Washington DC and the requirement for Bank Presidents to be US citizens give the impression of strategic capture.

The People's Republic of China (PRC), despite its global economic importance, ranks as an upper middle-income developing country. However, as already indicated, the PRC's rapid economic growth translates into increased bargaining power at the World Bank and IMF, where its contributions and thus voting rights are growing. As of 2015, China held a 4.62% voting share at the World Bank and, as the third largest shareholder, appoints an Executive Director to the Bank's Board (http://siteresources.worldbank.org/BODINT/Resources/278027-1215524804501/IBRDCountryVotingTable.pdf (Accessed July 7, 2016) and http://siteresources.worldbank.org/BODINT/Resources/278027-1215526322295/BankExecutiveDirectors.pdf (Accessed July 7, 2016).). The PRC opened to the West in the 1970s adopting a market economic system that continues to attract substantial foreign investment from the USA, Europe, and prosperous Asian neighbors. And yet, paradoxically, like India and Brazil, China also receives substantial bilateral and multilateral financial aid (Total World Bank lending to China stood at US$ 54 billion in 2015 (World Bank 2015e).).

Patterns of global coalition formation indicate degrees of convergence and divergence within the global system. In the economic sphere, the most influential state coalitions, not because of number but economic weight, are the Group of Eight (G-8) and the Group of Twenty (G-20) (G-20 membership: Argentina, Australia, Brazil, Canada, China, France, Germany, India, Indonesia, Italy, Japan, Republic of Korea, Mexico, Russia, Saudi Arabia, South Africa, Turkey, the UK, the USA, and EU.). These informal dialogue forums have the power to affect the global economy by shaping policy responses in the world's largest states, even if decisions are only loosely coordinated and impact "patchy" at best (Payne 2005, pp. 105–106). The G-8 was until the late 1990s the G-7, a coalition of leading economies comprising the USA, the UK, Germany, Canada, Italy, France, and Japan. In the late 1990s, Russia, not because of its economic clout but its political and geostrategic significance, was admitted to what became the G-8. Viewed by the USA as a welcome alterative to heavily bureaucratized UN processes and negotiations, intergovernmental gatherings to address specific global issues have become of increasing diplomatic significance. The approach reached a new level when the G-20 dialogue process was elevated with the first Leaders' Summit in Washington in 2008. This was a crisis meeting that brought together the heads of government from the world's 19 largest economies, including the EU, to avert a collapse of the global financial system through a coordinated emergency response. The G-20 has become an annual international event of considerable pomp, supported by ongoing discussions between diplomatic and technical representatives. In contrast to the G-8, and the Group of 77 (G-77) developing countries, formed in the 1960s to press for global trade justice at the UN, the G-20 spans North and South incorporating significant emerging market economies and oil producers. It is an expanded but nonetheless elite arrangement between globally significant states where the pursuit of geopolitical self-interest is balanced, precariously, with a vested interest in the preservation of global economic stability.

While it is standard for liberal global policy elites to assert that this evolving system can be governed in the interests of an emergent global public, decision-making power remains skewed. The global system is a weighted system in which some actors wield considerably more influence than others. Established structures of global authority are slowly being reformulated as new ideas and influencers emerge to challenge the old order, but the processes of change are slow and outcomes uncertain (Battersby 2014).

## Global Public Space

### International Nongovernment Organizations (INGOs)

A significant feature of late twentieth-century globalization is the growth, diversity, and complexity of nongovernment and civil society organizations. Because of their social orientation and institutional independence from states and commercial enterprises, nongovernment organizations are often categorized as elements of civil society and a nascent "global civil society" and referred to alternatively as civil society organizations (CSOs). A nongovernment organization (NGO) is so called because it is created independently of any government agency. These range in size from one or two persons to several hundred or more in the larger international nongovernment organizations (INGOs). From a handful of INGOs in the early 1900s, numbers rose over the next century reaching 59, 383, from which we can deduce a much larger number of affiliated or parallel national level NGOs of varying size (UIA 2014). Any not-for-profit, non-state organization operating in two or more countries can be categorized as an INGO, which in part explains the numerical growth of the past century. It requires surprisingly few resources to establish and run a small-scale organized international development program, but attrition rates are high for such normative microenterprises. Large INGOs in contrast like World Vision, for example, operate through global federal structures within which national affiliates draw upon significant local resources and exercise considerable autonomy. All are in some way agents that disseminate both complementary and heterogeneous ideas about justice, rights, freedoms, and social obligations (Table 3).

Nongovernment or civil society organizations (CSOs) vary greatly in size and sophistication, and there are many different criteria by which they can be categorized. One useful typology

**Organizations and Globalization, Table 3** Not-for-profit and civic entities in global perspective

| | Global | Local[a] |

Source: Developed from Costoya (2007)
[a]Incorporating national branches of international federations of NGOs and NGOs headquartered in one country but which maintain development and/or humanitarian programs in other parts of the world

distinguishes between highly structured actors that warrant the title *organization* and more amorphous *movements* with the former identifiable by formal decision-making structures, delegated responsibilities, budgets, and programs and the latter "civic" entities more fluid, inchoate, and volatile in the sense that they ebb and flow in tandem with global issues and the shifting priorities of those who organize them (Costoya 2007, pp. 10–12). Building upon these distinctions, organizations can be subdivided by role or "mission" into those that provide development assistance or emergency relief as their primary function and those that advocate on humanitarian and environmental issues. Then there is the significant sphere of faith-based NGOs, many of which promote an explicit religious message through their aid work and are uncomfortable with western secular human rights discourse (Petersen 2014).

INGO formation was spurred by the globalization of humanitarian concern and a lengthening development agenda after 1945 (Barnett 2011, p. 50). Decolonization and the struggle of newly independent countries to achieve social and economic development created a "demand" for assistance that governments and intergovernmental organizations were unable to meet. Formation, replication, and multiplication of these entities are driven by collective humanitarian concern and, among larger entities, a quest for social impact and political relevance. Whatever their accurate number, these nongovernmental actors have, in the areas of service delivery, won increased credence at the UN and other multilateral institutions that today rely upon international- and national-level NGO assistance to implement development projects.

Patterns of organizational change reflect the influence of dominant discourses and the system-wide pressures to survive to which even altruistic organizations are exposed. Relief agencies and many service-oriented entities operate across a wide range of societal extremes, from conflict zones to zones of severe deprivation and disease, placing enormous demands upon the resources, skills, and expertise of their staff. As NGO budgets become larger and as donors demand greater financial accountability, humanitarian actors have had to adopt modern management practices and develop organizational structures that mirror the private sector. Those who urge greater professionalism and greater concern for efficiency and accountability in the nongovernmental sector welcome this convergence (Lindenberg and Bryant 2001). Others are concerned that donor influence and contractual requirements generate an incremental process of "isomorphic change" in which NGOs become corporatized and subordinated to the governments and institutions from which they derive essential funding (Hopgood 2008; Stern 2008).

## The Commercial Sphere

### Transnational Networks of Production and Finance

Transnational corporations (TNCs) (Used here in preference to the term multinational corporation or MNC.), purveying a different and arguably contrary liberalism, significantly outnumber intergovernmental and international nongovernmental organizations. Benefiting from the relatively open and accommodating international business environment in the West and in industrializing Asia after 1945, TNCs have grown rapidly in number, scale, and complexity. By 2007, there were estimated 78,411 of such corporations headquartered predominantly in Western Europe, North America, and East Asia with 777,647 affiliates worldwide (UNCTAD 2007, p. 218). The deepening intricacies of transnational commercial organization render enumeration increasingly difficult. However, research by Stefania Vitali, James Glattfelder, and Stefano Battiston suggests that "control" over as much as 80% of TNC networks might be exercised, through complex contracting, investment, and other modes of financing, by less than 1000 companies (Vitali et al. 2011, pp. 1–6). Thus, while organizational plurality contributes to a rising quantum of global exchange, there is a global undercurrent of elite consolidation that can be glimpsed through the material and ideational linkages between global commercial and policy elites.

Transnational corporations (TNCs) are the most ubiquitous exemplars of deepening global complexity. Postindustrial or "post-Fordist" society reflects the increased application of knowledge to systemic processes. In the 1990s, this transition was epitomized by Just-in-Time (JIT) production, pioneered by the Japanese company, Toyota, in which the manufacturing processes is governed by strict inventory tailored to consumer demand (Castells 2000, pp. 168–172.).

The largest global corporations have achieved a position of economic power where they can, if not dictate terms, place enormous pressure upon governments to accommodate their transnational operations with generous tax incentives and weak or nonexistent environmental regulations (Wilks 2013). Their rapid growth in number and scale of operations is explained by the drive to escape government regulation and to access overseas markets by establishing manufacturing and assembly operations offshore (Picciotto 2011, pp. 115, 130–135). A sharp rise in TNC formation within developing countries since 1992, accompanied by a rise in South-South investment, adds further weight to claims that the geographic division of the world economy, between the industrialized North and underdeveloped South, is, to a large extent, breaking down (UNCTAD 2010, pp. 17–18).

Patterns of organizational transformation under globalization are of course irregular, with a wide variety of organizational types, but the general tendency in private enterprise, at least, is toward nebulous, organic, and intricate networks (Castells 2000; Gibson and Mats 1994, p. 10). In Zygmunt Bauman's analysis of contemporary society, the "heavy capitalism" of industrialization – often referred to as "Fordism" after Henry Ford whose surname became the eponym for an industrial epoch and whose Ford Motor Company came to symbolize the scientific management of mass manufacturing – is supplanted by "light capitalism" in a "liquid" context of smaller more flexible companies navigating a globalized world of hyper-competition and increasing volatility (Baumann 2000, p. 59).

The corporation, as a single entity, is no longer the norm. Many corporations and brands are household names, IBM, Chrysler, Standard Oil, Philips, Coca-Cola, Sony, Mitsubishi, Toyota, Nokia, Motorola, BHP-Billiton, Exxon, and many more. But today these companies cooperate in networks or "clusters" of corporations, to achieve efficiency gains from "internal" comparative advantages. qForms of corporate networks vary considerably as do the kinds of linkages within and between corporate clusters. TNCs are moving away from direct ownership of offshore operations toward alliances with in-country partners and increasingly to non-equity relationships with suppliers. These non-equity relationships or modes give greater flexibility to transnationals in selecting production locations and with shifting resources across geographical space in pursuit of greatest investment returns without being forced into protracted licensing negotiations with government agents (UNCTAD 2011, pp. 165–161). This at once delivers greater negotiating power to the contracting corporation and pressures prospective suppliers to comply with the globalized production and financing norms (Dicken 2011). What we have, according to Castells, is a society of thickening interdependencies and networked enterprises, introducing a confusing array of TNC clusters, which replace the monolithic but easily identifiable corporation (Castells 2000).

## Conclusion

This chapter has explored the evolution and transformation of international actors operating in the state sphere and the commercial and non-governmental development spheres. It highlights the increasing plurality of organized entities and organizational forms in an open global system that is more fluid and less predictable than the heyday of Fordism. It foregrounds relations and interactions between organizations to exemplify the ways in which ideas and practices become institutionalized and globalized over time. Large multilateral bureaucracies, the UN, and BWIs were formed to address specific issues and mobilize resources to achieve long-term structural changes but have been forced to adopt more flexible, multi-sector, and multilevel strategies to achieve

their objectives. Systemic pressures to conform to liberal economic principles within organizations are perhaps most clearly in evidence in the non-government sector, among civil society actors that have grown appreciably in size to accommodate lengthening global development and humanitarian agendas. Financial constraints imposed by increased scale, but also the changing global funding environment, have forced a reprioritization of organizational aims, to accommodate demands for accountability and efficiency and to demonstrate utility. At the international and global levels, the notion of the business organization as a single entity – upon which regulatory systems are built – is at odds with the dense and often impenetrable networks of ties between commercial actors, between financiers, producers, distributors, and parent company. The ideals and discourses of liberalism pervade this system, but, even as the ideology of market capitalism reaches its apogee in the early twenty-first century, diversification under globalization is engendering new discursive and institutional challenges to the global status quo that will lead to further and more far-reaching transformations in the decades to come.

# Organizations as Moral Agents

Berry Tholen and Michiel S. de Vries
Institute for Management Research, Department of Public Administration, Radboud University Nijmegen, Nijmegen, The Netherlands

## Synonyms

Collective responsibility; Organizational agency; Organizational responsibility

## Introduction

The evaluation of actions is a central element of social and political practice. Individuals, whether as citizens or in some official capacity, receive blame or praise for what they did or failed to do. The same goes for organizations. Judgments like the following are quite common: "Shell is responsible for the environmental disaster in Nigeria"; "The Organization for the Prohibition of Chemical Weapons really deserves the Nobel Peace Prize"; "Germany has to bear an historical guilt"; "Parliament is not an innocent bystander in this case"; "Trade unions must be praised for their efforts"; or "The UN has Rwandan blood on its hands." In statements like these organizations are referred to in the same way is common in the case of human individuals. The organizations are presented as moral agents in their own right that can be held accountable and that deserve praise or blame.

Yet, is it really appropriate to treat organizations as moral agents and thus equate them on this important point as human individuals?

Three types of comments have been raised against this practice. First, critics maintain that an organization cannot be understood as an individual actor as it consists of a plurality of individuals. "Organizational agency" should be understood and judged as what is really is: actions of (a number of) individuals. Secondly, an organization cannot be a *moral* agent. It lacks all the characteristics and capacities considered essential for a human person as a moral actor: having a conscience, feeling guilt, being able to deliberate and decide between right and wrong, and the like. And finally, accepting organizations as moral agents would have grave consequences. It would undermine the practice of holding individuals accountable – they might easily evade blame by presenting their actions as part of the organizational dealings. It would also imply that one has to consider organizations as equal to human beings, granting them the same rights individuals have, for instance.

Can the common practice to treat organizations as moral actors be defended against these

comments or must judgments, like the one's mentioned above, be understood as a matter of metaphorical speech without real consequence?

The next sections deal with the issue whether organizations might be understood as agents, whether it makes sense to treat organizations as *moral* agents, and whether taking organizations to be moral agents undermines moral practice. This entry is concluded with an assessment of the implications and complications of treating organizations as moral agents.

Organizations are seen as cooperative ventures being established for a certain aim, for a longer period of time, characterized by some form of internal decision-making and a capacity to act upon a decision. This description will return in the conclusion.

In the field of law and jurisprudence, it is also common practice to treat organizations as singular autonomous actors. Corporations and other types of collective arrangements are granted certain rights, they have legal obligations, and they can be held legally accountable. There might be particular legal considerations for this practice. In this entry the focus is on morals. That does not mean that moral considerations are of no relevance to law and jurisprudence. This issue, however, is not addressed in this entry.

## Can an Organization Be an Agent?

For organizations to be considered as *moral* agents they must at least be agents. According to a particular school of thought that is unreasonable. Adherents of *methodological individualism* claim that only individual human beings can be considered as true rational actors and that explanations of social phenomena can only refer to the actions and intentions of such individuals. This individualistic approach typically maintains that organizations – and other collectives for that matter – do not act themselves. Particular individuals think and act but not collectives. The particular civil servant performs a "state-action." Taking an organization as an actor is like failing to see the strings that move the puppet and believing that it moves all by itself. Presenting an organization as an actor in its own right implies that one takes a bureau, a firm, or any other collective as a creature that in some way exceeds or transcends its composing elements. By doing so, one adds a mystical entity or force to the world that actually is not necessary to explain the phenomena. In methodological terms: taking an organization as an actor violates the rule of parsimony. It implies the conjecture of an entity that cannot be tested or measured and that, in terms of explanation, does not have added value. Methodological individualism implies that granting agency to organizations is like taking metaphorical speech literally, comparable to presupposing a real acting creature when one hears an economist speak of "the invisible hand" (e.g., Downie 1969; Hayek 1955; Miller and Makela 2005; Popper 1960).

This individualist critique of organizational agency has been countered in several ways. One reply focuses on the *ontological* status of organizations and other collective entities. One can point out the parts of, say, a dog or a functioning state, but a dog or a state are not the same as an enumeration of their composing elements. The functioning as a whole makes that one can see and understand and meaningfully speak thereof as a whole. One can identify characteristics of a dog (say its hunting skills or loyalty) that are not meaningfully attributed to one or even the collection of its parts. Accepting a dog as actor in its own right thus does not at all violate the principle of parsimony and neither presumes some mystic substance or force. The same goes for an organization. It also has typical characteristics (e.g., the organizational culture) that cannot be reduced to the individuals being members of the organization or working in the organization.

Closely connected is the *epistemological* argument countering the methodological individualism. Its argument is that many social phenomena cannot be explained and understood adequately by reference to individual qualities and actions alone. Organizations often bring about policies and actions none of its individual members intended or favored. Organizational decision procedures, division of labor, culture, routines, and

the like make for a very complex relation between individual intentions and actions and organizational decisions and outcomes. Reducing all collective (or organizational) actions to those of individuals provides for a partial and biased understanding of what really is going on. Explanations that focus on the organizational level would do much better. This is similar to biological or psychological reasoning. Explanations for actions might be sought at a lower level of aggregation (cells or organs within organisms; neurological paths within the human brain), but some phenomena demand explanations on the higher level (the organism as a biological unity, human mind as intentional and conscious unity). Including organizations in the category of agents, therefore, is not just adding a superfluous item (e.g., List and Pettit 2011).

## Can an Organization Be a *Moral* Agent?

A second critique of taking organizations as moral agents might be called *moral individualism*. According to this approach, moral action is a unique characteristic of human beings. Being able to distinguish right from wrong, deliberate on what is appropriate, what deserves respect and consideration, is what sets human individuals apart from all other entities in the universe. This is a basic understanding, already expressed in ancient myths, like the one in book Genesis. This does not imply, however, that there is no variation in the understanding of human moral actor-ship. In Western philosophical thinking, two traditions can be distinguished: one can already be found in the work of Aristotle and another is expressed by Immanuel Kant.

In Aristotle's understanding, a moral person is able to deliberate on what is appropriate to do in particular circumstances and act upon it. That means that he/she has certain rational abilities and the capacity to make judgments. He/she also has moral feelings like pride, a sense of shame and consideration. Furthermore, he/she needs to have the self-discipline to act upon his or her judgments. Aristotle maintained that a person can, and should, develop moral capacities. A good person has developed a virtuous disposition or character. Moral agency is not only about particular actions but also about the continuous moral (re-) orientation of a person (Aristotle 2000).

Kant also emphasized the ability of judgment in the human being as a moral actor. He, however, focuses on man as a thinking and free creature. Autonomy, that is, the ability to think independently and act freely, makes for human dignity and demands respect. All individuals should respect this dignity in themselves and in every other person. No human individual should be treated merely as an instrument, and each should have equal rights in shaping the common world (Kant 2012). This basic notion of human dignity is also expressed in the Universal Declaration of Human Rights.

Moral individualism maintains that organizations cannot and should not be understood as moral agents. They do not have the moral competencies that, for instance, Aristotle expressed: They do not have desires and intentions and they cannot judge or feel grief. Organizations, moreover, cannot be said to have the type of continuity or constancy that individuals have: They might have a regularly changing set of members. Organizations also lack the Kantian dignity that one feels for individual human beings. In this individualist view, it would be absurd if organizations would be granted certain rights, like the right to live or not be sold as a property. Even though an organization constituted by contract by a set of individuals might be said to have rights (as is common in law), the organization is still not a moral agent in its own right. Its status and its rights completely depend on those of the constituting individuals (e.g., Lewis 1948; Velasquez 1983; Weber 1978).

Advocates of organizational moral agency argue that although organizations miss certain characteristics of human beings, these characteristics are not the ones crucial to moral agency. In this view, organizations can fulfill all the functions of a moral agent. They can gather information and investigate options; they can deliberate on different courses of actions; they can reach an informed

decision taking into account moral considerations; they can implement their decisions; they can be punished for their actions; and they can adjust to manage future situations in a better way. Needed is only a proper organizational structure. An organization that incorporates a proper deliberation and decision-making structure, a system that enforces decisions to be implemented, and a capacity for self-regulation can function as a moral agent. An organization with these three characteristics can take proper actions in particular cases and has enduring qualities like being just or unjust. It is of no consequence that individual membership within such an organization might change. The continuity is guaranteed by the organizational structure and other characteristics like a shared focus or we-perspective and a set of shared understandings among members of the organization (the organization's culture). The gist of this functional argument is that a well-structured organization in its functioning looks like a moral agent, and therefore it is a moral agent (e.g., Bratman 1999; Copp 2006; French 1984; List and Pettit 2011; Gilbert 2006; Rovane 1997; Tuomela 2006; Velleman 1997).

Advocates of organizational moral agency also address the argument of moral worth or dignity. Their argument resembles the reply to methodological individualism. What is typical and worthwhile for groups or organizations cannot completely be reduced to the constituting individuals. For one, organizations often outlive their founding fathers, after which those individuals can no longer be held responsible for things happening within the organization. Secondly, organizations seen as collectives deserve certain rights (and obligations) in order to respect and protect something that transcends the individual members or participants. This applies to cultural, religious, ethnic, and national group rights. The rights given, for instance, to a native tribe or a regional language group are meant to protect the collective. The advocates of this line of reasoning add that this does not mean that organizations can be said to deserve right and respect completely equal to that of individual human beings (e.g., Kymlicka 1989; Taylor 1994).

## The Consequences of Organizational Agency for Our Moral Practice

A third critique of taking organizations as moral agents focuses on its consequences and argues that doing so undermines our moral practice. This threat has several forms. First, if organizations are allowed to take the blame for particular wrongs or harms, individuals can wave their accountability. They might refer to one of the many organizations they are a member of and deny their own liability ("I played only a minor role, I was only part of the organizational machinery, I have no idea what others do with it"). This shift in blame (and praise) from the individual to the organization undermines individual moral development and complicates mutual trust and cooperation. Another aspect of holding organizations morally accountable strengthens the effect: the sanctions involved in case of wrongdoing. Sanctioning organizations (through fines or public blame) in practice might hurt the members of the organization (salary cuts or losing jobs), most of whom are not causally responsible for the harm done. It might even be the case that they were not yet a member of the organization when the harm was done, they might not even been born yet (like past wrongs attributed to war faring states or colonial powers). In all such cases, people are blamed and punished for actions that they had no causal role in and that they might never have intended. In short, holding organizations accountable threatens to eradicate the link between individual intentions and actions on the one hand and blame and praise on the other, with dire consequences (e.g., Thompson 1980).

Another type of threat arising from the practice of granting rights to organizations as moral agents is that group rights can be used as trumps against individuals. They might be invoked against outsiders (for instance, to protect the grounds of a native tribe) and against members themselves (natives that are not allowed to sell their property as they please). Granting group rights may be at odds with individual freedom and could violate the principle of human equality as it favors some over others (e.g., Barry 2001).

In reaction to this third type of comment, the advocates of organizational moral agency reverse the claim: Accepting organizations as moral agents does not undermine but strengthen moral practice. Society consists of a multitude of organizations and in that context the moral practice of judging actions and attributing praise and blame can only be effective if organizations are treated as moral agents. If that would not be possible, one would be confined in ascribing responsibility, because there are no individuals to blame, since the individuals involved lacked the overview, were unable to master the powers involved, and could not have taken such risks. This also applies to issues at the international level. If states, the EU, the UN, or the World Bank are not regarded as moral agents, issues of peace and security, refugees, or the environment could not be judged in ethical terms. By including these organizations in our moral vocabulary, they can be induced to act. By blaming and praising these organizations, they are stimulated to reorient and develop themselves and to improve (e.g., Baier 1991; French 1984; Forrest 2006; List and Pettit 2011; Neuhäuser 2014; O'Neill 1986; Wasserstrom 1991).

The claim that accepting organizational moral agency undermines individual morality is unwarranted, the retort continues. The argument of some kind of zero-sum-perspective in which more organizational responsibility automatically implies less individual responsibility fails. In this line of thinking, it is very well possible that the organization as well as particular individuals are to blame for particular wrongdoings. The responsibility of the UN for the tragedy in Srebrenica, for example, does not exclude specific military officers from their responsibility for their particular actions and the consequences thereof.

Also, it is true that blaming or sanctioning organizations might have negative consequences for innocent members. That, however, is not something that is unique for the case of organizations as moral agents. If sanctions are imposed on parents as individuals, the children involved might share in the burden. This is not a reason to dispense of punishment (let alone of holding people responsible) but rather a reason to try to find the most proper sanction or blame in particular circumstances (e.g., French 1984; List and Pettit 2011).

A last retort concerns organizational or group rights. Here again, possible negative consequences can be neutralized by taken countervailing measures. For example, individuals might be granted rights to opt out in order to guarantee their individual liberties (in the case of citizens of a sovereign state having the right to migrate), and nonmembers might have the right to compensating measures if policies are prejudicial to them (e.g., Kymlicka 1989).

## Conclusion

The conclusion cannot but be that the idea of organizations as moral agents is a disputed concept and that either or not accepting the idea of organizations as moral agents is only half of the story. Well-structured organizations can perform the same functions that one attributes to human moral agents, and accepting organizations as moral agents might therefore be beneficial for our moral practice. Yet, the elaboration that led to this conclusion also disclosed some complications.

First, one has to note that moral actor-ship is an ambiguous concept. It involves, at least, the (Aristotelean) aspect of having moral capacities and the (Kantian) aspect of moral worth. A well-structured organization might be said to have the same moral capacities as an individual human being, but in case of moral worth, the identification cannot be that complete. Organizations might have rights, but these rights are different from the rights granted to individuals. Even if organizations are granted moral agency, their status is not identical to that of individual human beings. Moral actor-ship, probably, might best be understood as a plural or scale concept (e.g., Bratman 1999; Griffin 2008; Hindriks 2014).

A second issue concerns the exact definition of an organization that deserves the status of moral

agent and the finding that alternate arguments for or against organizations a moral agents are related to the understanding of organizations as a unity. Some advocates of organizational moral agency focus on the internal decision-making structure (e.g., Copp 2006; French 1984; List and Pettit 2011). Others argue that joint commitments and a "we-perspective" of individual members is the crucial point (e.g., Bratman 1999; Gilbert 2006; Tuomela 2006; Velleman 1997). These two approaches seem complementary but can result in opposite claims. The structure approach would hold a bureaucratic organization responsible even if the members are disinterested, while the commitment approach would not, because of the absence of joint intentions. The commitment approach would be able to morally judge an unorganized collective like "the medical profession" or "the Muslim community" in a particular case, while such a group obviously fails on internal decision-making structure.

As to the consequences of accepting organizations as moral agents, it was argued that including organizations into the moral universe might have severe consequences for the position of individual members of such an organization. Advocates of organizational moral agency maintain that these consequences can be remedied. It remains a disputed matter whether that is a tenable position (e.g., Barry 2001).

# Organizing Unions as Social Policy

Jaz Brisack
University of Mississippi, Oxford, MS, USA

## Definition

Card check: An alternative to a union election, in which the NLRB verifies that more than half of the eligible employees at a company have signed union authorization cards and then certifies that the union has been approved. The company must agree to this process.

Closed shop: Unionized companies in which joining the union is a condition of employment. Outlawed under right-to-work laws.

Fair election principles: A set of guidelines establishing "equal time" for both the company and the union to discuss their positions during work hours. The company must allow organizers onto company property to conduct meetings, video screenings, flyer distribution, etc. It also must refrain from threatening workers and allow them to decide freely.

Neutrality: The company agrees to refrain from interfering with the unionization effort by showing antiunion videos, making antiunion statements, intimidating or threatening workers, or otherwise attempting to prejudice workers against the union. However, it does not include "equal time."

NLRB: National Labor Relations Board, a federal agency that governs union elections and oversees the organization process.

Right-to-work laws: Legislation prohibiting closed shops.

## Introduction

*When the union's inspiration through the worker's blood shall run,*
*There can be no power greater anywhere beneath the sun,*
*Yet what force on earth is weaker than the feeble strength of one?*
*For the union makes us strong.*

Thus begins "Solidarity Forever," the anthem of organized labor (Kornbluh 2011, 26). As in Aesop's fable of the bundle of sticks, that could only be broken when untied and snapped individually, the labor movement's central tenet can be summed up in the old axiom that there is strength in numbers.

Labor unions form as a direct response to oppressive working conditions, giving workers a chance to improve their own lives. Collective bargaining makes working men and women equal with management when they meet to negotiate a contract. From ending child labor to establishing a minimum wage, from weekends to overtime, from health care plans to pensions, from unemployment benefits to paid time off, from sick days to parental leave, from grievance procedures to health and safety regulations, labor unions have given workers the ability to improve their lives.

Thinking of these improvements, the civil libertarian lawyer Clarence Darrow once said that "With all their faults, trade-unions have done more for humanity than any other organization of men that ever existed. They have done more for decency, for honesty, for education, for the betterment of the race, for the developing of character in man, than any other association of men" (Darrow 1909).

The history of organizing labor unions is a bloody one. Mary Harris "Mother" Jones, an organizer for the United Mine Workers in the early twentieth century, wrote that, "Life comes to the miners out of their deaths, and death out of their lives" (Jones 2012, 122). Massacres, murders, lynchings, tarring and featherings, beatings, imprisonments, and deportations have all been used to try to stop workers from demanding their rights. From the Pullman strike of the 1890s to the Battle of Blair Mountain in the 1920s to the Charleston longshoremen's picket of 2000, government force has been a powerful weapon in the attempt to quash labor. Recently, legislatures across the country have passed laws to hamstring unions' ability to organize.

Yet, despite these odds, unions remain a powerful force for justice and reform. They continue to call attention to deep-seated societal problems while providing a basis for intersectional activism.

## Unions in the United States

### Private-Sector Unions

The history of private-sector unions is rooted in a centuries-long struggle to replace, or ameliorate the abuses of, capitalism. During the Industrial Revolution, massive factories replaced craftsmen's workshops. No longer the owners of the means of production, workers became interchangeable parts of a vast machine. Rather than reaping the rewards of their work, they received scanty wages from the businessmen their labor enriched. This oppression begot radical alternatives.

Industrialization reached the United States just after the end of the Civil War. Soldiers returning from a bloody battle to make men free were forced to work under conditions that endangered their safety, stripped them of their ability to provide for their families, and burdened them under ever-mounting debts. Remembering the chattel slavery they had fought against, many of them began referring to their new economic reality as a system of "industrial" or "wage slavery."

In 1869, a group of these veterans, from both sides of the Mason-Dixon line, formed an association to struggle against these conditions. The resulting organization, the Knights of Labor, was based on a new and revolutionary concept: class struggle. At a time when nearly all other groups were exclusive to advancing the interests of white Protestant men, the Knights of Labor welcomed women, African-Americans and Catholics into its ranks. They organized skilled and unskilled workers alike, developing the "one big union" concept. In their efforts to secure reforms, including the 8-h day, the abolition of the scrip system, and the end of child and convict labor, they pioneered the tactical use of strikes (Boyer and Morais 1955).

Subsequent labor unions have diverged in certain respects from this original organizational template. Issues of contention have evolved over the years, as automation develops and multinational corporations grow. Some unions have decided to focus on specific trades, while others have organized a broader base. The use of strikes has gone in and out of favor. New labor laws have introduced new methods of – and barriers to – organizing.

Yet, most unions have incorporated significant aspects of this prototype. In the 1900s, the Industrial Workers of the World married the organizing strategies of the Knights of Labor with a radical anarcho-syndicalist philosophy. Many unions, from the Southern Tenant Farmers Union in 1930s Arkansas to the Gulfcoast Pulpwood Association in 1970s Mississippi to the SEIU's nationwide Fight for $15 campaign today, have continued the tradition of incorporating civil rights activism into their drives for economic justice. And, for nearly all unions, strikes remain an integral tool for securing members' rights.

The development of laws regulating unions has had a significant impact on the trajectory of unions' internal structure. Prior to the New Deal, the most effective labor unions were characterized by a radical opposition to the corporate-controlled government that inexorably opposed their organizing efforts. The state was viewed responsible for maintaining the capitalist system that oppressed workers. During the First World War, which most labor organizers considered a trumped-up conflict designed to enrich munitions manufacturers and other corporations, antiwar activism was central to labor's platform.

The policies of Franklin D. Roosevelt's administration signaled a marked shift in the attitude of labor toward government. While many of these laws – such as the National Labor Relations Act – did not go as far in ensuring workers' rights as many unions had hoped, they were nevertheless a significant improvement on the status quo. In a reversal of their previous policy, labor agreed to refrain from striking during Second World War to ensure continuous production.

This cooperation with the government has had negative influences on the labor movement. Rather than trusting to the power of united workers, union leadership has developed a

tendency to lobby politicians, even after they have displayed tendencies to renege on their promises. Over the years, this has led to reactionary and counterproductive stances, from the United Mine Workers' purge of suspected Communists during the Red Scare to the United Auto Workers' support of the South Korea free trade pact and the AFL-CIO's endorsement of the Dakota Access Pipeline. It also enabled the rise to power of compromised individuals, such as AFL-CIO president George Meany, who boasted of "never walking a picket line" (Washington Post 1980).

Union leadership has undergone many changes over the years, and is in the midst of another change. In the beginning, radical rank-and-file organizers explicitly grappled with the forces of capitalism, risking their lives and refusing to compromise, even with other labor unions, such as the discriminatory and elitist AFL under the leadership of Samuel Gompers. Charismatic and fiery organizers like Eugene Debs, Bill Haywood, Mother Jones, Lucy Parsons, and Elizabeth Gurley Flynn were typically reluctant to assume leadership roles but extremely effective once they agreed to do so.

As time went on, labor leaders became more conciliatory: John Llewellyn Lewis of the United Mine Workers cooperated with McCarthyism, while other labor leaders supported the military-industrial complex by encouraging increased munitions production. At the turn of the last century, union leadership underwent a new transition, as the student activists of the 1960s who had joined the movement as idealistic young organizers – typically, well-educated, Northern, white men – began to assume leadership positions. Some, like Bruce Raynor, attempted to rekindle the "one big union" philosophy by merging labor unions together. While this strategy can strengthen unions, it also tends to supersede the beginning of new organization drives to recruit members.

Today, as the demographics of union members skew increasingly toward women and racial minorities, leadership is undergoing a new shift. Women still comprise a slightly smaller segment of the unionized workforce than men, but have been steadily closing the gender gap. Unions have had successes in organizing hotel housekeepers, waitresses, nurses, teachers, and other "pink-collar" workers, even as traditionally male-dominated manufacturing jobs have been moving overseas. The leadership of several major unions has become increasingly integrated as women are finally elected to the highest positions, indicating an understanding that increasing inclusivity is critical if unions are to successfully organize in the twenty-first century.

### Public-Sector Unions

Organizing the public sector is a significantly different proposition than organizing the public sector. Public perceptions often run counter to the interests of the workers, while strict laws often forbid the use of certain tactics. For these reasons, the rate of unionization within the public sector is just 6.4%, as opposed to 34.4% of private-sector employees (Bureau of Labor Statistics 2017).

While unions have enjoyed considerable success in organizing certain segments of the public workforce – notably, teachers and police officers – the perception that public employees are essential to maintaining society's operations can cripple organizing efforts and has resulted in laws outlawing strikes. Moreover, the struggle is framed as a dispute between workers and taxpayers or the general public, rather than workers and businessmen or capitalists or even shareholders: public opinion tends to favor workers in the latter situation far more than in the former.

## Organizing Unions: Techniques and Practices

The first step in organizing a union centers around strategy. For workers seeking unionization at their company, this means uniting with coworkers around this common goal and then identifying a union that represents their industry and agrees to work with them on their campaign. Often, a catalyst, such as a loss of benefits, a significant cut in wages, or a death or injury of a coworker, ignites this effort and accelerates the process.

For a union planning a new drive, this involves identifying a target company and researching its operations, working conditions, and position within the broader supply chain. For example, the United Auto Workers' campaign at Nissan in Canton, Mississippi, was a strategic objective, as the organization of a large multinational corporation almost always results in the subsequent organization of smaller supplier companies. This principle was recently illustrated by the organization of the Faurecia facilities in Tuscaloosa, Alabama, and Cleveland, Mississippi, which was made easier by the fact that their largest customer is the unionized General Motors.

Once a unionization effort is underway, workers must sign authorization cards declaring their support of the union and desire for a vote on union representation. This process can be speedy or protracted, depending on a variety of factors, ranging from employee satisfaction to intimidation by management to familiarity with unions. At least 35% of eligible workers at a company must have signed cards before the union can petition the National Labor Relations Board for a vote; however, because 50% plus one of the vote is required to win an election, the card-signing goal is typically far higher.

In order to recruit workers into the organizing effort, union organizers use a variety of tactics. House calls, involving visits to workers' homes, are a particularly effective measure, while phone calls can also help. Establishing and building a worker committee is crucial: workers have access to their company and can discuss the union with coworkers on the job (United Electrical Workers n.d.). Maintaining visibility is important, and the worker committee plays an integral role in this by wearing T-shirts, buttons and hats, signing up workers as they enter or leave the plant, and holding conversations at work and on social media. Sometimes, large demonstrations involving the broader community can build momentum: the United Auto Workers held a mass march, featuring Senator Bernie Sanders and activist actor Danny Glover, to the Nissan plant to catalyze support for a vote (Elk 2017).

The ability to maintain accurate and consistent charts is one of the most important qualifications for a union organizer, particularly when the company involved employs a large number of people. Charts give a graphic representation of the progress of a campaign, identifying which workers are for or against the union, the leaders of the unionization effort within the plant, undecided and wavering workers, and areas of concern. While the exact layout of these charts varies from one campaign to the next, they are a critical part of ensuring a victory.

Some union organizing campaigns are made significantly easier by the cooperation of the company. While many companies run antiunion campaigns, hiring union-busting consulting firms and intimidating workers, others refrain from such activity. For example, a company can agree to a card check rather than an election, which favors unions by avoiding the possibility of former union supporters defecting under pressure from the company or outside influences. It can also agree to neutrality, or to abide by fair election principles. Public opinion campaigns, or pressure from other unionized companies, are an important part of getting companies to abide by these conditions.

### Right-to-Work States

Contrary to their intention, and despite the fact that they pose new difficulties in membership maintenance and add to the financial burden on labor unions, right-to-work laws have actually made union *organizing* easier.

Right-to-work laws, which are in place in 28 US states and Guam, outlaw closed shops (National Conference of State Legislatures 2017). Employees thus have the right to join, or not to join, a union at their company. This circumstance means that employers cannot threaten that workers who do not join the union will be fired, a statement that can dissuade some undecided workers in nonright-to-work states.

That said, the political climate of right-to-work states is usually far more hostile to unionization, which produces other barriers to organizing. Politicians often bolster company antiunion campaigns by threatening that plants will close or that their states will stop attracting new companies if workers vote yes. During the United Auto Workers election at Volkswagen in Chattanooga,

during which the company had agreed to neutrality, Senator Bob Corker ensured defeat by promising during voting that new product would come to the plant should workers vote no. Governor Nikki Haley joined Boeing's antiunion campaign in South Carolina by appearing on radio ads, mentioning her opposition in her State of the State address, and posting on social media. Mississippi governor Phil Bryant has engaged in similar behavior during the Nissan campaign. Furthermore, states that have passed right-to-work laws have often passed even harsher anti-union legislation, such as North Carolina's new farm bill that curtails union organizing in the agriculture industry.

## Conclusion

Labor unions in the United States occupy a paradoxical position. Simultaneously persecuted and praised, they are courted at election time by the very politicians who will pass laws to undermine them as soon as they are in office. Written out of school textbooks, demonized by right-wing think tanks, and dismissed as "no longer necessary," labor unions nevertheless continue to make substantial improvements in people's daily lives. Though its objectives and challenges have evolved over the years, labor has the ability to draw on the experience of its rich and varied history for guidance in its present-day campaigns.

## Synonyms

Ireland; Local administration; Local authority; Local government.

## Definition

Local government is generally defined as a subnational government, comprising a complex set of democratically elected local councils and representative authorities that are created by constitutional or statutory parliamentary provisions for the purpose of providing and administering social services to the inhabitants of a particular local area or district, with a degree of autonomy and structural independence from the central government.

## Introduction

A characteristic feature perhaps peculiar to contemporary Ireland in terms of the tenacity and persistence of exogenous institutional forms is that the origin and structure of its local government had its roots in the long history of conquest and invasion that began with the Anglo-Normans in the twelfth century, culminating in British colonial rule over Ireland. Indeed, much of the pre-nineteenth-century local government system of Ireland was the result of reform trajectories that

evolved out of the long course of Irish history in which different groups had profoundly shaped the system, leaving in their tracks, a trail of political and administrative imprints that endured to this day. Specifically, the origin of contemporary Irish local government can be traced to two closely related historical developments: the Anglo-Norman invasion and the English colonial rule.

## Local Government During the Anglo-Norman

While the Celts, who arrived in England and Ireland around 500 BC, were the first group in a long chain of settlers to institute a locally oriented administration, the Anglo-Normans, who established a colony of the region during the twelfth c., were said to have introduced rudimentary forms of municipal administration. Although the bulk of Irish towns and urban centers had emerged on the heels of a series of invasions and successions, they were, by and large, the creation of the Danish Vikings: barbarian invaders from northern Europe who conquered Ireland in 795 AD. These latter bands of foreign raiders, which came in a series of waves, soon began to settle and establish fortified structures, which subsequently transformed into urban settlements that came to be known as the Norse cities. Thus, for example, a number of Ireland's major cities, including Dublin, Cork, Limerick, Wexford, and Waterford, are considered to have been of Danes origin (McManus 1993, p. 32; Haslam 2003, p. 17). They existed as a conglomeration of independent kingdoms and autonomous principalities mainly located along the long strip of the eastern coastal areas of the island of Ireland.

It was the Normans, however, who, originating from England and Wales, expanded the already existing towns all the while establishing new settlements and urban centers further inland. With the Norman castles, military forts, abbeys and cathedrals forming as centers of political, military, religious, and social organization around which new towns and urban centers revolved, they provided further impetus to the growth and emergence of new settlements, which went deep into the heartland of the island. Moreover, it was following the Norman conquest of Ireland that spatial, demographic, and economic criteria were devised in which towns and centers of population were granted the status of boroughs. The granting of royal charter to larger towns not only provided the legal framework which contributed to the conditions that enabled self-government but also marked the transition from the static land-based serf-landlord relations to market and tax-based burgess-crown relations.

Once organized and established, these towns and urban centers were subsequently opened up for new settlers from England who were induced by privileges, promises of land and tax exemptions in the venture to make Ireland their new home. The general body of town dwellers, which came to be referred to as burgesses were vested with charter land, hitherto in the possession of the town, as well as land that was acquired from the surrounding territories by expansion and occupation. Despite interwoven by deep running sentiments of local loyalties, these settlements were, however, devoid of any form of central authority. And this lack of a centrifugal political force, combined with the effects of regional and physical geographic fragmentation, gave rise to a complex situation where endless inter-tribal rivalries, which were accompanied by a new set of conflict between de jure and de facto feudal lords spilt over into carnage and bloodshed, taking on sometimes epic and mythic proportions.

More often than not, the Norman kings ruled from outside Ireland proper through their representatives called *justiciar*. The whole territory of the island and its major towns were designated as *liberties*: a cluster of towns or a fixed amount of territory that the Norman king distributed to his immediate family members or to the royal knights. Alternately, the king entrusted the administration of *nonliberties* territories and subregional enclaves to the royal sheriffs who ruled their respective locality on behalf of the king (Otway-Ruthven 1980, p. 176). In the regions of early Anglo-Norman settlements, while large territorial administrative areas were commonly referred to as *cantred,* whose jurisdiction compares to the modern day barony, the smaller territorial

subdivisional areas were commonly referred to as *commote* – a designation, which corresponds to the Irish *tuath* – a term synonymous to the medieval Latin *theodum* (Moody et al. 1982, p. 74).

With the Norman king of England exercising Lordship over Ireland, and the Lord Lieutenant forming the personal representative of the king, the Anglo-Normans had been able to lay down the rudimentary political and social institutions, which in time evolved into more complex forms. Indeed, the ever growing degree of political and administrative prowess, which meant the establishment of organizations and filling them with a corps of professionals and administrators: a form of civil service that bore a vague resemblance to the modern system of administration, establishing an accounting and budgeting systems, which were banded together under a presiding treasurer.

Perhaps most significant in terms of the process of state formation and consolidation was a legal system that the Anglo-Normans transplanted to Ireland. It was a form of legal order, which encapsulated a jury system that foreshadowed the beginning of a county organization. Out of this jury system gradually evolved a permanent representative body of law-makers called parliament. Rather than legislation in any conventional sense of the word, parliament was more of a transient and less prolific nature as gatherings were sporadic and momentary and only much later that they became a permanent and regular feature of a law making institution. Nonetheless, it could be described as an innovative mode of political and legal organization, in terms of its configurations, which denoted rudimentary parliamentary mechanisms of debate and its nexus of communication and decision-making. Moreover, it led to the cultivation of a sense of political belonging that was inspired by common identity features of an exclusive class of Anglo-Irish, whose single-minded and exploitative pursuit of self-interest further spurred the development of a new set of political and legal institutions, marking the emergence of the perceptions and expressions of Irish statehood (Boyce 1995, p. 32).

As far as local government during this time was concerned, there were various levels of territorial subdivisions where townships and urban settlements were redefined and restructured with the chartered borough of England serving as a benchmark. Having added newly conquered towns to the already established tribal lands, a similar form of government was extended to the newly acquired regions. More specifically, the town government was organized around an elected mayor and town council. The mayor, also known invariably as *portreeve* or *sovereign*, who exemplified what could be considered a very close approximation to the contemporary form of municipal local government system, where the mayor is chief executive of the town council, enjoyed wide ranging powers and tremendous prestige. The mayor was backed up by an army of administrative staff, which involved the shire *reeve*, who was the chief magistrate of the town and the coroners who looked after the private property and financial interests of the king.

Similarly, the organization of the functions of the town council involved dual bodies. Whereas an inner circle, which worked closely with the mayor, assisting him in carrying out the day to day administration of the town, the assembly or the common council, on the other hand, concerned itself with legislative matters of the town. Rudimentary forms of municipal functions and services, which encapsulated the maintenance of law and order, town defense, construction and upkeep of town conduits, causeways, bridges, asylums, houses of correction, and public buildings, chartering of markets and fairs, and the organization of town celebrations, and religious events were performed. Besides, there were a band of clerks, butlers, stewards, chamberlains, and constables manning and running the day to day affairs of the royal courts, including the judicial services and local military orders. Similarly, it was part of the administrative staff duty, especially of the exchequer to collect revenue required for the upkeep of the town. It was mainly derived from geld, which was a form of land tax levied on the king's land owning subjects as well as taxes levied on income, in the form of sheep poll taxes and rents exacted from movable and immovable municipal properties.

The notion of self-government was always there and was bestowed as an honor and privilege

exclusively to a few select towns. Self-government meant the vesting of electoral rights, which applied categorically to those dwelling within the town proper, in terms of electing the mayor and the establishment of the town council as well as courts of law and judicial tribunals. Those who resided without the town, however, merely enjoyed access to markets and fairs. Overall, the structure, organization and process of the municipal government of Ireland during this period paralleled more or less to what obtained erstwhile elsewhere in Western Europe. At this stage, however, the establishment of corporate governance, which constituted the mayor and town dwellers as a body of citizens, was unknown, not even a vague notion of it until much later. In fact, it emerged during the late fifteenth to early sixteenth century, which coincided with the ascendancy of the Tudor dynasty, where all the major towns acquired the privileged status of chartered towns in the reign of Henry VII, and subsequently grew to become self-governing boroughs modeled after the English model. The government features of the towns, which qualified remotely anything as municipal regimes, had their own courts of elected officials and magistrates, who managed their own affairs free of royal interference – common example of local government patters that obtained across Europe (Webb 1918, pp. 1–20).

## Local Government Under the Tudor Re-Conquest of Ireland

The sixteenth century was a period, which saw the emergence of central authority, where English Reformation and re-conquest under the Tudor dynasty altered the hitherto Lordship of Ireland into the Kingdom of Ireland, with Henry VIII at the helm. Initially, he asserted and consolidated his rule over areas around Dublin. Eventually, however, he spread his rule across the whole of Ireland through the king's writ – known as the county sheriff (which later on came to be known as the Lord Lieutenant). This event, which could be regarded as watershed in the history of Ireland, marked the beginning of a long-standing and bitter antagonism that was expressed in racial and religious relationships, often descending into open rebellion and warfare. Land ownership and economic rights, including the introduction of draconian penal laws and commercial codes, during the seventeenth and eighteenth centuries, which curtailed religious and economic freedoms were some of the key underlying drivers of the conflict that further fuelled sectarian tensions.

In order to consolidate their rule over Ireland, Tudor kings established exclusive royal lands and conferring the same to loyal tribal lords and clan chiefs. Moreover, they managed to centralize power at the center by entrusting the local administration into the hands of an appointed official, called the Lord Lieutenant who was responsible to a royal council called the Privy Council. Similarly, they expanded the role and power of the Justices of the Peace – local officials who were responsible for the maintenance of law and order, the administration of justice, and the organization of local defense and mobilization of militia. The administration of justice and the adjudication of local cases operated under a system of a roaming circuit of judges called Assize Courts. They were drawn from the clergy and landed nobility and owed their power directly to the king. The local administration was buttressed by an array of local officials, including record keepers, churchwardens, constables, mayors, and city aldermen who carried out the-day-to-day local functions and were responsible to the Lord Lieutenant. What was peculiar during the Tudor period was the development of a town charter based on the fundamental notions of legal existence, where towns were organized as a body corporate with clauses that granted powers not only to the general citizenry but also to the mayors and burgesses (Haslam in Callanan and Keogan 2003, p. 17).

The political dynamics between England and Ireland would culminate in what came to be known as the Acts of Union 1800, which dissolved the short-lived Irish parliament of 1782–1800 and incorporated the hitherto kingdom of Ireland into a new state – the United Kingdom of Great Britain and Ireland. Political, social and economic relations, which were more animated by class and commercial considerations

and ethno-religious sentiments were further reinforced by British policy of indifference which manifested itself throughout the height of the ravages of famine and the ensued emigration whose severity was sometimes placated, if not checked, within a political context of a parliamentary form of British state that appeared to bear the hallmarks of colonialism. In this age-old conflict, where reforms on almost every issue could be vigorously challenged by every aggrieved and discontent social force at every social and cultural level, it would appear that the very reforms that had been introduced to remedy a situation did not always suffice and indeed backfired, making matters even worse. Thus, for example, the apparently well-intentioned land reforms that sought to give access and security of land to tenants were accompanied by contingent consequences that widened rather than bridged the chasm of sectarian tensions, which resulted in permanently partitioning Ireland politically and ideologically between two protagonists: loyalists and republicans.

The period under English rule largely followed the prevailing model in England, culminating in what came to be known as the Victorian era. Ever since the early nineteenth century, the prevalent local government model in Ireland was that of Westminster. It pretty much reflected the long-established framework of a centralized authority into which Ireland had been integrated. Much of legislation affecting local government of Ireland during this time was the result of policies, which had been formulated in the Imperial Cabinet rather than in Ireland. As a result, the local government system of Ireland came to reflect that of the English local structures and practices, where cities, towns, and boroughs operated under a few appointed councils of professionals and oligarchies chaired by the mayor.

## Municipal Corporations (Ireland) Act, 1840

Starting from the middle of the nineteenth c. on, however, a more elaborate form of local government was established. Specifically, as a result of the Municipal Corporations (Ireland) Act, 1840, which sought to reform municipal boroughs, major cities were incorporated and hence handled their affairs like a corporation managed by elected bodies. Similarly, while towns were reorganized under town commissioners – who were also elected representatives – villages and rural counties were set up under the leadership of the Grand Jury: a group of people made up of substantial property owners, who were accountable to the county sheriff. Overall, while mid-nineteenth-century Ireland saw a reform that established Municipal Corporations (Ireland) Act, 1840, the end of the nineteenth century was marked by the establishment of what came to be known as the foundation statute of Irish local government, the Local Government (Ireland) Act, 1898. The ultimate goal of the Act was to eliminate the inefficiencies and corruption by the Grand Jurors, which was best thought to be achieved by abolishing the entire system of Grand Jury and by broadening the democratic representation of tax payers in the county administration.

## Local Government (Ireland) Act, 1898

The introduction of the Local Government (Ireland) Act, 1898 represented a watershed in the history of the development of the modern local government system of Ireland. This reform Act ushered in drastic changes that fundamentally transformed the structure, organization, and process of the local government units in Ireland. Introduced by the conservative government of Gerald Balfour, the reform wrought drastic changes in terms of the replacement of all forms of political appointments, including the Grand Juries and Poor Law Guardians (hitherto largely appointed officials who were legally responsible for the administration and running of indoor relief services for the poor) with elected representatives. The Local Government (Ireland) Act, 1898, which enfranchised women for the first time, granting eligibility to vote in local elections, did also massively broadened the franchise to male householders and people occupying part of a house, making it possible for them to vote, thereby allowing parliamentary electorates to

became electorates of local government elections. Indeed, it was a landmark piece of legislation, establishing for the first time democratically elected councils on a much broader popular franchise.

Moreover, the scope and substance of current local government functions were expanded and, not least, the Act introduced at the territorial level, regional, and local government units by creating a two-tier system. Whereas in the major cities and urban centers, both county-boroughs and county-councils formed the upper tier, the rural and urban district councils, in the rural and larger towns, respectively, constituted the lower tier. As much a democratic as a legal-administrative project, the local reform Act of 1898 was intended to be representative enough to warrant mass participation in politics, which drifted down the lowest levels of the local government units. But, perhaps most importantly, the 1898 reforms produced contingent consequences, which were crucial in generating nationalist sentiments in the psyche of the new-generation of locally elected representatives who identified local democracy with the wider national agenda of independence. The reforms were instrumental in not only mobilizing local solidarity needed for national agenda but also in creating new political opportunities and resources for political schooling and civic leadership for the new office holders who often put national issues ahead of the local ones.

This single-minded pursuit of national objective further entailed the need to lay the groundwork for national strategy in terms, not only of the creation in 1905 of a political party called *Sinn Fein*, but also the reordering and reorganizing of political priorities and roles, including the compilation of a national constitution and the formation of a legislative assembly, in 1918, called the *Dàil Eireann* – all in anticipation of independence. Moreover, it was during the years leading up to the independence of Ireland in 1922, that the restructuring and reforming of the local government system was conceived as an ideal, which *Sinn Fein* leaders had envisioned and held in the highest esteem to implement when they came to exercise power at the local and later on at the national level. Having established first, their own independent parliament, *Sinn Fein* they then proceeded to establish a local government department and local government units that encapsulated the desire for self-sufficiency and independence. To this end, they undertook major policy changes involving the geographic modification of regions in order to override what they saw narrow regional sentiments, which proved instrumental in expediting the progress towards national independence. As such, the 1898 reforms could be considered as a harbinger of epic political transition, in terms of advancing and accelerating the formation of Irish statehood that would eventually be realized.

In the immediate pre-independence period, the local government structure, including the overall direction and finance of local government was overhauled by British authorities who operated through the British Local Government Board whose headquarters was in Dublin Castle: the seat of British administration in Ireland. In spite of the appearance of formal democratic processes and elections, the board continued to exercise considerable central control. In fact, the exercise of tight central control could be demonstrated by the number of inspectors employed by the Board to overhaul local authorities, which was by far greater than what one would find in England or Wales. Direct central control was accompanied by strict control over the use and sources of financial resources. Indeed, the restrictive effect of these provisions, which had the secondary goal of ensuring loyalty and allegiance to the British Crown, was further augmented by the threat of withdrawal of the annual grants on which local government units depended. It was in their bid to break away from the constant alerts and demands that the British authorities were making over the local government units that *Sinn Fein* leaders embarked upon an ambitious and daring project of creating a separate local department. Once established, it began to drift away with complete structural and organizational independence, serving as a gateway to new financial access, which helped the nationalists to shore up local funds sufficiently, if not desirably, as they had to collect the somehow unpopular local rates secretly from the prying eyes of the Royal Irish Constabulary.

## Conclusion

The foundation and development of local government in Ireland is attributed to the Anglo-Normans who established a colony of the region during the twelfth century. What was more peculiar during the Norman period was that these features encouraged new town settlements that came into existence as a result of new Anglo-Norman wave of population movements from England into Ireland, which through conquest had now become part of their kingdom. These new settlements were often founded around castles and were largely driven by external incentives in the form of granting settlers powers of self-government, which encapsulated the election of town officers, councils, courts, magistrates, enabling office-holders to wield enormous administrative and economic powers over their jurisdiction. To this end, the Norman royal charter designated two categories of land: royal land and town land. While the charter for the use of royal land rested with the king or his heirs and successors, the charter that provided for the use of town land was conferred upon the whole citizens or burgesses. The Norman period was also marked with the introduction of a relatively complex set of municipal administrative structures.

However, it was during the Tudor conquest of Ireland that a centralized and more consolidated state and local government structures appeared to emerge. The modernization of local government and the consolidation of democracy at the local level, however, came much later with the Local Government (Ireland) Act, 1898, which could be regarded as a landmark in the history of the development of local government in Ireland. Particularly, the provision, which extended the franchise both to women and to male householders or occupiers, so that the parliamentary electorate would become the local government electorate, ultimately resulted in the emergence of local representation in which elected councilors took control of county, urban and rural districts councils. The contingent feature of this reform would give further impetus to the struggle for national independence. Following independence, and indeed long before it, Ireland has undergone a series of reforms designed to deal with new political, economic, and social circumstances, and as a result, it has been able to acquire its own unique political and administrative institutions. Yet, the British legacy has long permeated upon its national and local government institutions that the reforms often appear to heavily draw on institutional values and practices that had been preeminent under the British rule.

## Definition

Occupational Safety and Health Act also commonly referred to as occupational health and safety (OHS) or workplace health and safety (WHS) is an area concerned with the safety, health, and welfare of people engaged in work or employment.

The Social Security Act of 1935 established a system of old-age benefits for workers, benefits for victims of industrial accidents, unemployment insurance, and aid for dependent mothers

and children, the blind, and the physically handicapped.

The Fair Labor Standards Act of 1938 introduced the 40-h work week, established a national minimum wage, guaranteed "time-and-a-half" for overtime in certain jobs, and prohibited most employment of minors in "oppressive child labor." It applies to employees engaged in interstate commerce or employed by an enterprise engaged in commerce or in the production of goods for commerce, unless the employer can claim an exemption from coverage.

The Walsh-Healey Public Contracts Act is a US federal law that applies to US government contracts exceeding $10,000 for the manufacture or furnishing of goods. Walsh-Healey establishes overtime pay for hours worked by contractor employees in excess of 40 h per week and sets the minimum wage equal to the prevailing wage as determined by the Secretary of Labor. The law prohibits the employment of youths less than 16 years of age and convicts (only those currently in prison), except under certain conditions. The Act sets standards for the use of convict labor and job health and safety standards. The Walsh-Healey Act does not apply to commercial items.

Longshoremen's and Harbor Workers' Compensation Act gave the Labor Department authority to set safety and health standards for the very small workforce covered under this law.

## Introduction

Public efforts to improve safety date from the very beginnings of industrialization. States established regulatory commissions as early as the 1840s, but they had few powers and were rarely able to exert much influence on working conditions. Most of the early commissions were ineffectual (Whiteside 1990). However, in the years between 1900 and World War I, progressive reformers, muckraking journalists, businessmen, and labor unions pressed for changes in many areas of American life. Work safety became of increased public concern. In response, Congress passed a host of modest regulations that addressed rather minor risks (Aldrich 1997).

In factories after the Civil War, many workplace hazards confronted workers. The reports of state labor bureaus in the 1870s and 1880s indicated many tragedies, and the industrial accident statistics that state labor bureaus collected encouraged social reformers and labor organizations to call for state factory safety and health laws. In 1877, Massachusetts passed the nation's first factory inspection law (Massachusetts Bureau of Statistics of Labor 1872; Commons and Andrews 1916). Its passage prompted a burst of state factory acts. By 1890, nine states provided for factory inspectors, 13 required machines guarding, and 21 made limited provision for health hazards (MacLaury 1970). However, since the passage of the first law, there have been many amendments to cover new hazards, etc.

It is highly impossible to discuss Occupational Safety and Health Act (OSHA) without an overview of worker's compensation. Thus, this topical area will provide an overview of worker's compensation law in the United States, a summary of OSHA, a brief discussion on why the OSH Act is important, OSHA as a social policy, and conclusion.

## Worker's Compensation in the United States

A European ideal, in 2010 New York, became the first state to pass a workmen's compensation law. Instead of requiring injured workers to sue for damages in court and prove the employer was negligent, the new law automatically compensated all injuries at a fixed rate. Compensation appealed to businesses because it made costs more predictable and reduced labor strife. Between 1911 and 1921 forty-four states passed compensation laws (Fishback and Kantor 2000). The sharp rise in accident costs that resulted from compensation laws and tighter employers' liability initiated the modern concern with work safety and initiated the long-term decline in work accidents and injuries. Large firms suddenly became interested in safety, and companies began to guard machines and power sources, while machinery makers developed safer designs. Managers

began to look for hidden dangers at work and require that workers wear hard hats and safety glasses. They also set up safety departments run by engineers and safety committees that included both workers and managers. In 1913, companies founded the National Safety Council to pool information. Government agencies provided scientific support while universities researched safety problems for firms and industries (Aldrich 1997, 1999; Fishback and Kantor 2000; Worrall 1983).

A workers' compensation advocate, John R. Commons of the University of Wisconsin, urged the creation of the first permanent State Industrial Commission which developed and enforced safety and health regulations after hearing comments from labor, management, and others in the United States (Commons and Andrews 1958). This idea was widely accepted and became a guide for future state and federal regulations of occupational safety and health.

In 1913, Congress created the Department of Labor and one of its main purposes was to improve working conditions. Entry of the United States into World War I precipitated a crisis in health and safety conditions in the hard-pressed war production industries. To meet this challenge, Congress initiated the working condition service. The service inspected war production sites, advised companies on reducing hazards, and helped states develop and enforce safety and health standards. When the war ended, the service was allowed to expire, but the Labor Department ordered its records saved for the time "when public and legislative opinion again shall have become focused upon the necessity for a constructive organization of this character" (U.S. Department of Labor 1919).

Under the administration of President Franklin D. Roosevelt a Bureau of Labor Standards in 1934 was a rallying point for those interested in job safety and health (Perkins 1934; MacMahon and Millett 1939). This was the first permanent federal agency established primarily to promote safety and health for the entire workforce. The Bureau helped state governments improve their administration of job safety and health laws and raise the level of their protective legislation. Additionally, Congress enacted three laws as part of Roosevelt's New Deal which amplified the federal government's role in protecting people on the job:

1. The Social Security Act of 1935
2. The Fair Labor Standards Act of 1938
3. The Walsh-Healey Public Contracts Act of 1936

By the late 1950s, the federal-state partnership was no longer adequate to deal with growing threats to workers' safety and health. Consequently, in 1958, Congress passed the Longshoremen's and Harbor Workers' Compensation Act which gave the Labor Department authority to set safety and health standards for the very small workforce covered under this law. Under the Act, the Secretary of Labor was authorized to seek penalties against willful violators, but not against those who only carelessly broke the rules. After holding public hearings, the department began enforcing standards in 1960. Compliance was good, and the high accident rates declined sharply (Gilhooley 1958).

In the 1960s, economic expansion again led to rising injury rates, and the resulting political pressures led Congress to establish the Occupational Safety and Health Administration (OSHA) and the Mine Safety and Health Administration in 1970 (Derickson 1993; Fairris 1998; Mendeloff 1979). In December 1960, the Labor Department issued its own a set of mandatory safety and health standards under the Walsh-Healey Act. The department had previously issued most of these standards in a *Green Book* of informal guidelines to aid federal and state inspectors. States had been encouraged to inspect federal contractors and enforce their own rules. Now they were barred from applying their standards and had to enforce the federal rules. For the first time, the federal occupational safety and health requirements were applied to the whole range of industry (U.S. Department of Labor 1960).

Spurred by criticism and a number of tragic incidents in the workplaces, in 1967 the standard unsuccessfully advocated before the Federal Radiation Council was adopted (Chittenden 1964). This move had a decisive impact on the shaping of a national job safety and health

program. The basic problem with the implementation of the Act is that there was no fundamental agreement either on the Act's goals or on the practical methods of balancing considerations of greater safety and health against considerations of cost. Also, there was no agreement among policy makers or lobbyists on the framework that should be used for the discussion of these issues primarily because safety and health are generally regarded as "goods" of inestimable, if not infinite, value (Smith 1976). Therefore, for 3 years, Congress battled to pass a bill to protect workers on the job that was acceptable to both Democrats and Republicans. In 1970, Congress passed and on December 29, 1970, President Richard Nixon signed the Occupational Safety and Health Act (MacLaury 1970).

## Summary of the Occupational Safety and Health Act

Congress passed the Occupational and Safety Health Act (OSHA), 29 U.S.C. §651 et seq. in 1970. Under the OSH Act, employers are responsible for providing a safe and healthful workplace. OSHA's mission is to assure safe and healthful workplaces by setting and enforcing standards and by providing training, outreach, education, and assistance. Their goal was to make sure employers provide their workers a place of employment free from recognized hazards to safety and health, such as exposure to toxic chemicals, excessive noise levels, mechanical dangers, heat or cold stress, or unsanitary conditions (https://www.epa.gov/laws-regulations/summary-occupational-safety-and-health-act).

The Occupational Health and Safety Administration Occupational Safety and Health Administration (OSHA) administer the Occupational Safety and Health (OSH) Act. Safety and health conditions in most private industries are regulated by OSHA or OSHA-approved state plans (U.S. Department of Labor, https://www.dol.gov/general/topic/safety-health). Additionally, the Office of Workers' Compensation Programs administers four major disability compensation programs which provide wage replacement benefits, medical treatment, vocational rehabilitation, and other benefits to certain workers or their dependents who experience work-related injury or occupational disease. Other specific groups are covered by the Energy Employees Occupational Illness Compensation Program, Federal Employees' Compensation Program, Longshore and Harbor Workers' Compensation Program, and Black Lung Benefits Program (https://www.dol.gov/general/topic/workcomp). The Office of the Ombudsman for the Energy Employees Occupational Illness Compensation Program (EEOMBD) and the SHARE initiative also play a role in the administration of DOL workplace safety and health programs (Ibid). These entities serve employee groups covered under the relevant statutes and regulations by mitigating the financial burden resulting from workplace injury. In order to establish standards for workplace health and safety, the OSH Act also created the National Institute for Occupational Safety and Health (NIOSH) as the research institution for OSHA. OSHA is a division of the US Department of Labor that oversees the administration of the Act and enforces standards in all 50 states (https://www.epa.gov/laws-regulations/summary-occupational-safety-and-health-act).

OSHA Jurisdiction:

- Covers private sector employers
- Excludes self-employed, family farm workers, and government workers (except in state plan states)
- Approves and monitors 28 state plan states which cover private and public sector employees
- Assists Federal Agency Programs

OSHA inspectors, called compliance safety and health officers, are experienced, well-trained industrial hygienists and safety professionals whose goal is to assure compliance with OSHA requirements and help employers and workers reduce on-the-job hazards and prevent injuries, illnesses, and deaths in the workplace. Normally, OSHA conducts inspections without advance notice and on site or by phone or fax by highly trained compliance officers. The on-site

inspection begins with the presentation of the compliance officer's credentials, which include both a photograph and a serial number. If this is not presented, employers have the right to require compliance officers to obtain an inspection warrant before entering the worksite. During an opening conference, the compliance officers explain why OSHA selected the workplace for inspection and describe the scope of the inspection, walk-around procedures, employee representation, and employee interviews. The employer then selects a representative to accompany the compliance officer during the inspection. An authorized representative of the employees, if any, also has the right to go along. In any case, the compliance officer will consult privately with a reasonable number of employees during the inspection.

*Walk-around*. Following the opening conference, the compliance officer and the representatives will walk through the portions of the workplace covered by the inspection, inspecting for hazards that could lead to employee injury or illness. The compliance officer will also review worksite injury and illness records and the posting of the official OSHA poster. During the walk-around, compliance officers may point out some apparent violations that can be corrected immediately. While the law requires that these hazards must still be cited, prompt correction is a sign of good faith on the part of the employer. Compliance officers try to minimize work interruptions during the inspection and will keep confidential any trade secrets they observe.

*Closing conference*. After the walk-around, the compliance officer holds a closing conference with the employer and the employee representatives to discuss the findings. The compliance officer discusses possible courses of action an employer may take following an inspection, which could include an informal conference with OSHA or contesting citations and proposed penalties. The compliance officer also discusses consultation services and employee rights.

OSHA carefully prioritizes all complaints it receives based on their severity. For lower-priority hazards, with permission of a complainant, OSHA may telephone the employer to describe safety and health concerns, following up with a fax providing details on alleged safety and health hazards. The employer must respond in writing within five working days, identifying any problems found and noting corrective actions taken or planned. If the response is adequate and the complainant is satisfied with the response, OSHA generally will not conduct an on-site inspection. Before conducting an inspection, OSHA compliance officers research the inspection history of a worksite using various data sources and review the operations and processes in use and the standards most likely to apply. They gather appropriate personal protective equipment and testing instruments to measure potential hazards. The agency seeks to focus its inspection resources on the most hazardous workplaces in the following order of priority:

1. *Imminent danger situations* – hazards that could cause death or serious physical harm receive top priority. Compliance officers will ask employers to correct these hazards immediately or remove endangered employees.
2. *Severe injuries and illnesses* – employers must report:
   - All work-related fatalities within 8 h
   - All work-related inpatient hospitalizations, amputations, or losses of an eye within 24 h
3. *Worker Complaints* – allegations of hazards or violations also receive a high priority. Employees may request anonymity when they file complaints.
4. *Referrals* of hazards from other federal, state or local agencies, individuals, organizations, or the media receive consideration for inspection.
5. *Targeted inspections* – inspections aimed at specific high-hazard industries or individual workplaces that have experienced high rates of injuries and illnesses also receive priority.
6. *Follow-up inspections* – checks for abatement of violations cited during previous inspections are also conducted by the agency in certain circumstances (OSHA, https://www.osha.gov/dep/index.html).

When an inspector finds violations of OSHA standards or serious hazards, OSHA may issue citations and fines. OSHA must issue a citation

and proposed penalty within 6 months of the violation's occurrence. Citations describe OSHA requirements allegedly violated, list any proposed penalties and give a deadline for correcting the alleged hazards. Violations are categorized as willful, serious, other than serious, de minimis, failure to abate, and repeated. Penalties may range up to $7,000 for each serious violation and up to $70,000 for each willful or repeated violation. In settling a penalty, OSHA has a policy of reducing penalties for small employers and those acting in good faith. For serious violations, OSHA may also reduce the proposed penalty based on the gravity of the alleged violation. No good faith adjustment will be made for alleged willful violations.

The Occupational Safety and Health Administration's revised recordkeeping rule includes two key changes: First, the rule updates the list of industries that are exempt from the requirement to routinely keep OSHA injury and illness records, due to relatively low occupational injury and illness rates. The previous list of industries was based on the old Standard Industrial Classification (SIC) system and injury and illness data from the Bureau of Labor Statistics (BLS) 1996, 1997, and 1998. The new list of industries that are exempt from routinely keeping OSHA injury and illness records is based on the North American Industry Classification System (NAICS) and injury and illness data from the Bureau of Labor Statistics (BLS) from 2007, 2008, and 2009. The new rule retains the exemption for any employer with ten or fewer employees, regardless of their industry classification, from the requirement to routinely keep records. Second, the rule expands the list of severe work-related injuries that all covered employers must report to OSHA. The revised rule retains the current requirement to report all work-related fatalities within eight hours and adds the requirement to report all work-related inpatient hospitalizations, amputations, and loss of an eye within 24 h to OSHA.

Establishments located in states under federal OSHA jurisdiction were required to comply with the new requirements on January 1, 2015. Establishments located in states that operate their own safety and health programs (state plan states) were informed to check with their state plan for the implementation date of the new requirements. The final rule allows OSHA to focus its efforts more effectively to prevent fatalities and serious work-related injuries and illnesses. It also improved access by employers, employees, researchers, and the public to information about workplace safety and health and increase their ability to identify and abate serious hazards.

### Appeals

When OSHA issues a citation to an employer, it also offers the employer an opportunity for an informal conference with the OSHA Area Director to discuss citations, penalties, abatement dates, or any other information pertinent to the inspection. The agency and the employer may work out a settlement agreement to resolve the matter and to eliminate the hazard. OSHA's primary goal is correcting hazards and maintaining compliance rather than issuing citations or collecting penalties.

Alternatively, employers have 15 working days after receipt of citations and proposed penalties to formally contest the alleged violations and/or penalties by sending a written notice to the Area Director. OSHA forwards the contest to the Occupational Safety and Health Review Commission for independent review. Alternatively, citations, penalties, and abatement dates that are not challenged by the employer or settled become a final order of the Occupational Safety and Health Review Commission (https://www.osha.gov/OshDoc/data_General_Facts/factsheet-inspections.pdf).

## Why Is Occupational Safety and Health Important?

Work is one of the most important determinants of a person's health. The US civilian workforce employed approximately **140** million people in 2009 (http://www.bls.gov/cps/cpsaat01.pdf [PDF – 26 KB]). Since the passage of the OSH Act of 1970, workplace deaths decreased nearly 66% and occupational injury and illness rates decreased 67% (https://www.osha.gov/dep/

2015_enforcement_summary.html). However, it is argued that addressing occupational safety and health poses numerous challenges:

1. The US population is becoming increasingly diverse. These demographic changes result in new safety and health issues which will more than like have increased risks of work-related diseases and injuries.
2. Workplaces are rapidly evolving as jobs in the current economy continue to shift from manufacturing to services.
3. Major changes are also occurring in the way work is organized. Longer hours, compressed work weeks, shift work, reduced job security, and part-time and temporary work are realities of the modern workplace and are increasingly affecting the health and lives of workers.
4. New chemicals, materials, processes, and equipment are being developed at an ever-accelerating pace pose emerging risks to occupational health.

Hence, OSHA continues to respond to new challenges from emerging industries, new technologies, and an ever-changing workforce by utilizing strategic mechanisms such as site-specific targeting (SST), National Emphasis Programs (NEPs), the Severe Violator Enforcement Program, and corporate-wide settlement agreements.

## OSHA as a Social Policy

In *A Tattered Safety Net*: *Social Policy and American Inequality*, Colin Gordon provided a short history of American social policy. Accordingly, he indicated that social policy exists to cushion the impact of the market – including the inequality that follows from disparate patterns of education, employment, and opportunity. Gordon maintains that it aims to secure the income of workers and to bolster the incomes of those who cannot (or cannot be expected to) work (Gordon 2014). Social policy refers to the aspects of public policy that affect the distribution of income and wealth within a community, the relationships between people in communities, the well-being of individuals and family units, and the relative security or risk that individual citizens experience in their relationship to the economy.

Social policy is generally considered to include policy and programs dealing with income security and income redistribution, as well as health, education, and social services that support individuals' quality of life in communities (August 2007). Thus, these policies help ensure the human resource base and stability of social relations that are preconditions to a healthy economy. The most effective social policies are developed with strong reference to economic issues and relations and vice versa. Social policy can have a number of purposes: to redistribute resources among individuals or family units to ensure that "social minimum" standards of living are maintained, to influence or modify relationships among citizens to make a community more cohesive and secure, to shape peoples' social or economic behaviors, or to mediate the impacts of market forces and social trends on individuals and families.

A term which is applied to various areas of policy, social policy, can refer to guidelines, principles, legislation, and activities that affect the living conditions conductive to human welfare such as a person's quality of life, usually within a governmental or political setting (Spicker 2014). Social policy aims to improve human welfare and to meet human needs for education, health, housing, and economic security. Important areas of social policy are well-being and welfare, social security, justice, unemployment insurance, living conditions, animal rights, pensions, healthcare, social housing, family policy, social care, child protection, social exclusion, education policy, crime and criminal justice, urban development, and labor issues. Insurance has been a growing policy topic, and a recent example of healthcare law as social policy is the Patient Protection and Affordable Care Act formed by the 111th US Congress and signed into law by President Barack Obama, a Democrat, on March 23, 2010.

According to Spicker, social policy is the study of social services and the welfare state. In general terms, it looks at the idea of social welfare and its

relationship to politics and society. More specifically, it also considers:

- The policy and administration of social services, including policies for health, housing, income maintenance, education, and social work
- The needs and issues affecting the users of services, including poverty, old age, health, disability, and family policy
- The delivery of welfare (Ibid.)

Made in response to some issue or problem that requires attention, social policy might take the form of law, or regulation, or the set of all the laws and regulations that govern a particular issue or problem, and is made on behalf of the public as the solution to a problem. These policies are made by government, even if the ideas come from outside government or through the interaction of government with the public. Nearly every employee in the nation comes under OSHA's jurisdiction with some exceptions such as miners, some transportation workers, many public employees, and the self-employed. Employers subject to the OSH Act also have a general duty to provide work and a workplace free from recognized, serious hazards (DOL, https://www.dol.gov/general/topic/safety-health). Many governments have agencies which formulate and administrate social policies, and governments approach social issues in a variety of ways. The immediate effect of social policies can be economic and social improvement in a nation.

## Mechanisms for Social Policy

Governments at the federal, state, or local level formulate most social policy. While they have the principal role in establishing social policy and often in funding social programs, the actual implementation of social policy may occur in a number of ways, often involving nongovernment stakeholders. Some social policies and programs are implemented directly by government through programs and services delivered by public servants. Government may also pay a private business or individual to deliver a social program directly to citizens, e.g., residential services for adults requiring special care, operated by private individuals or corporations, while private businesses are active in areas such as disability supports. Other services may be delivered by agencies or institutions outside of government, but subject to varying degrees of government control or influence exercised through funding relationships. These so-called "third party" social policy agents can range from small local community social service organizations to large, complex, and long-standing institutions. Some social policies are implemented by regulating markets or relations between citizens, rather than by providing social benefits or services. An example of this type of policy would be labor laws and regulations that set minimum standards for wages and employment conditions. By influencing the behavior of employers toward their employees, these public policy measures help society maintain minimum work and living standards among the significant proportion of the population that makes a living through paid employment.

Governments may also transfer funds directly to citizens to help them buy the supports or services they need from existing private or public markets. A significant proportion of tax revenue is spent on such transfers to individuals. Therefore, based on the definition and mechanisms of a social policy, it would be defensible to say that the OSH Act is a social policy because it seeks to advance the general welfare of the citizens in the United States.

## Conclusion

Workplace safety is a health issue. Thus, health and safety programs are an important part of preventing injury and illness in the workplace. Workplace safety and health laws were enacted to eliminate personal injuries and illnesses from occurring in the workplace and to help employers and employees understand the potential hazards they are exposed to. The laws consist primarily of federal and state statutes. Federal laws and regulations preempt state ones where they overlap or contradict one another.

However, the OSH Act has been controversial, in part because of the extent to which it allows the federal government to reach into states and regulate private businesses. Many states, however, operate federally subsidized workplace health and safety plans that include workers in both the private and public sectors.

The main statute protecting the health and safety of workers in the workplace is the Occupational and Safety Health Act (OSHA). Congress enacted this legislation under its constitutional grant of authority to regulate interstate commerce. OSHA requires the Secretary of Labor to promulgate regulations and safety and health standards to protect employees and their families. Every private employer who engages in interstate commerce is subject to the regulations promulgated under OSHA. In order to aid the Secretary of Labor in promulgating and enforcing regulations, the Act establishes the National Advisory Committee on Occupational Safety and Health.

OSHA establishes the Occupational Safety and Health Review Commission to review citation orders of the Secretary of Labor. The Commission's decision is subject to judicial review. Federal agencies must establish their own safety and health regulations. The regulations that have been promulgated under OSHA are extensive, currently filling five volumes of the Code of Federal Regulations.

Under OSHA, states are not allowed, without permission of the Secretary of Labor, to promulgate any laws that regulate an area directly covered by OSHA regulations. They may, however, regulate in areas not governed by federal OSHA regulations. States wishing to regulate areas covered by OSHA regulations must submit a plan for federal approval. The amount of state regulation varies greatly (https://www.law.cornell.edu/wex/workplace_safety).

According to Mark Aldrich, the dangers of work are usually measured by the number of injuries or fatalities occurring to a group of workers, usually over a period of one year. However, he maintains that as a result of the gradual shift of jobs from relatively dangerous goods production into such comparatively safe work as retail trade and services such measures reveal a striking improvement in the safety of work. While the AFL-CIO agrees that the passage of the Occupational Safety and Health Act of 1970, safety, and health conditions in our nation's workplaces have improved, it maintains that too many employers continue to cut corners and violate the law, putting workers in serious danger and costing lives. Many hazards remain unregulated. Thus, the job safety law needs to be updated to provide protection for all workers who lack coverage and to strengthen enforcement and workers' rights (AFL-CIO, http://www.aflcio.org/Issues/Job-Safety).

# Outlaw Citizenship

Amelia A. Pridemore
Florida International University, Miami, FL, USA

## Synonyms

Citizen participation; Protest; Social equity

## Definition of Outlaw Citizenship

Outlaw citizenship is when citizens eschew normative means of citizen participation, such as speaking at government meetings, for nontraditional and often confrontational activities such as protests and online organizing.

## Introduction

When citizens want their governments to hear them and they have a door literally or figuratively shut in their faces, many of them will resort to less traditional forms of citizen participation in the political process. This less-than-orthodox form of citizen participation that includes protests and online organizing is known as "outlaw citizenship" (as cited by King and Nank 2015).

Outlaw citizenship, as termed by American public administration scholars Cheryl S. King, at the Evergreen State College in Olympia, Washington, and Renee Nank, of the University of Texas Rio Grande Valley (2015), happens when citizens eschew traditional means of citizen participation such as speaking at public hearings for nontraditional and often confrontational activities

such as protests and online organizing, according to Craig Rimmerman, an American Public Policy scholar at the Hobart and William Smith Colleges in New York state (2011). This is extremely important for the public administration discipline to understand for two main reasons. It is on the rise, and it is now the most commonly used form of citizen participation in government. This encyclopedia entry will, namely, explore outlaw citizenship's roots to understand this phenomenon. The key takeaway point is that outlaw citizenship is not spontaneous, according to Sadiya Akram, a lecturer in British Politics at Queen Mary University's School of Politics and International Relations in the United Kingdom (2014). It is the result of a long buildup of citizen frustration – largely because of social inequity and a lack of access to traditional forums – that eventually reaches a tipping point. Administrators need to not only consider social equity in their decision-making but also recognize its very related consequence, outlaw citizenship, and work to create a constructive dialog with disaffected, marginalized citizens.

Outlaw citizenship activities can be both nonviolent and violent and legal and illegal (Rimmerman 2011). Rimmerman notes that illegal activities do not necessarily have to be violent and points to the examples such as the nonviolent, civil disobedience protests such as the sit-ins during the American Civil Rights Movement (which he notes is a very positive and effective example of outlaw citizenship). However, outlaw citizenship can range from a legally, permitted nonviolent demonstration and nonviolent civil disobedience to violent ones such as vandalism, rioting, and even terrorism. The violent forms, Rimmerman contends, often do nothing to attract others to a group's cause and often turn the public against groups who undertake such activities.

Social inequity is, most often, the roots of outlaw citizenship. Those who participate in such activities are often on society's margins and believe there is no other way to be heard (Rimmerman 2011). A major goal of outlaw citizenship is not to work with government but *against* government to disrupt policies the participants believe are unjust. Rimmerman (2011) notes that outlaw citizenship is now the most commonly used form of citizenship, which makes it imperative that public administration scholars around the world understand it. Globalization has affected outlaw citizenship for at least a century, but technology is enabling that even more now (Crockett 2017; Prose 2017). Inevitably, administrators from around the world will directly or indirectly encounter outlaw citizenship, which makes this topic especially critical for administrators to understand.

This encyclopedia entry first outlines why outlaw citizenship is not spontaneous. Outlaw citizenship is the result of longstanding frustrations citizens have with their governments, often because of unequal treatment. Then, it explains how many traditional citizen participation forums only exacerbate tense situations, with systems designed to make public administration more democratic actually doing the opposite. A major point is both a literal and figurative lack of access to traditional citizen participation forums. Then, the author will discuss the impact of globalization. Outlaw citizenship activities, techniques, and movements have spread globally for at least a century, but technology has made this much more prevalent, accessible, and faster. The author will conclude with recommendations for the public administration discipline, particularly as it must increasingly serve a disaffected public.

## Not Spontaneous: Outlaw Citizenship's Seeds Planted Before Eruption

When public administrators encounter outlaw citizenship, it should not be a shock. These activities are not spontaneous outbursts of citizen rage but, most often, the straw that breaks the camel's back, per se. While examining 2011 riots in the United Kingdom after a man was shot and killed by police, Akram (2014) presented a theoretical framework based on the late French sociologist Pierre Bourdieu's "habitus," which is a person's understanding of how to behave and interact on a daily basis.

Habitus is largely the product of a person's upbringing and social class, with a person's

earliest experiences being a major component of the actor in society he/she eventually becomes, and this is very difficult to change (Akram 2014). Two elements compose a person's habitus, the unconscious and – the one most important in understanding why citizens revolt – preconscious. Unconscious is a largely forgotten personal history that nonetheless shows itself through "second nature" (as cited in Akram 2014). The preconscious, though, is not forgotten. A person's preconscious includes all of the experiences that make up his/her habitus that are clearly remembered. Some of those experiences can be negative life events or treatment in society, such as job loss or experiencing racism. Habitus stability prevents people from acting on grievances in their preconscious, at least for a while. Akram (2014) pointed out that 78% of the 1,344 people who appeared in court during the 2011 riots were on the UK's Department of Work and Pension's National Benefits Database. Akram further noted:

> . . .these individuals were more likely to come from deprived areas, had below-average levels of education, and higher-than-average levels of unemployment. . .. . . . From this perspective, one might see rioting as a form of political protest in response to structural inequality. (pp. 375–376)

The final step in Akram's framework is one of motivation and habitus change (2014). Riots happen, Akram argues, because of ruptures in habitus resulting from underlying grievances. Riots are the end part of a process and not simply a single, spontaneous event. The grievances citizens have initially operate at the preconscious level, but a major event such as a police shooting will be the spark that moves citizens into action.

Examples include the 1921 Battle of Blair Mountain in West Virginia, often called the largest armed insurrection in the United States since the Civil War, when 10,000 coal miners and 3,000 coal company supporters and sheriff's deputies waged a "ferocious battle with rifles, machine guns, and even bomb-dropping biplanes," according to Evan Andrews, a freelance writer for the US History Channel (2016). Blair Mountain, though, was not spontaneous but rather the culmination of grievances miners had with coal companies since the 1800s, when they were paid low wages in company currency that could only be used at company stores, worked in deplorable safety conditions, and were harassed and evicted from their homes by company-hired private detectives, if they chose to unionize and strike. The tipping point was when the companies' private detectives shot and killed pro-union Matewan (W.Va.) Police Chief Sid Hatfield. The outraged miners then planned their march.

Such experiences are not unique to the United States. This was also the case in late 1996 and early 1997, when Bulgaria experienced its most severe political crisis since the end of communism in 1989, according to political scientist Elena Simeonova of the University of National and World Economy in Sofia, Bulgaria (2005). This eventually led to the height of civil unrest in January 1997, when two groups of protestors forced their way through a double barrier of police at the parliament building, merged, and began vandalizing. An estimated 12,000–20,000 people were in the adjacent square, with protestors burning an effigy of the Bulgarian Socialist Party chairwoman in front of the building. This was also not spontaneous. Before this, social conditions had taken a turn for the worst, with the country's currency being devalued by 2,000%, rising food prices and citizens being unable to afford other essentials such as shelter and clothing, and political scandals and corruption. Citizens were suffering, working for about 6–7 dollars per day, Simeonova (2005) noted (p. 52).

## No Access, No Effect: Outlaw Citizens Unheard in Traditional Venues

Those utilizing outlaw citizenship also turn to such methods because traditional participation is figuratively or literally inaccessible or even nonexistent and because, often, any available traditional participation does not work. Social equity, or lack thereof, remains a major factor in the more historical roots of outlaw citizenship.

Social upheaval created a push for citizen participation in public administration in both academic research and in practice. H. George Frederickson, an American public administration

scholar at the University of Kansas (1997), writes that New Public Administration emerged in the late 1960s and early 1970s as a response to multiple social upheavals such as the Vietnam War and "continuing racial unrest" (p. 13). Frederickson writes that New Public Administration is not a single new lens for viewing public administration issues but it is a practice of consulting viewpoints from other social science disciplines and using them to examine how these apply to public problems. A key element of some New Public Administration thought is that it often conflicts with more traditional public administration scholarship that chiefly values efficiency and economy.

New Public Administration's conflict with traditional public administration thought, Frederickson (1997) argues, is that it is one that takes the critical question of social equity under consideration. Frederickson writes that classic public administration seeks to answer one of two questions: how to offer more or better services with available resources (efficiency) and how to maintain current service levels with less money (economy). New Public Administration adds a third question – whether or not a service enhances social equity.

The public administration discipline has not focused its concern or attention to issues involving variations in social and economic conditions, Frederickson argues (1997). It may be convenient to say that one citizen is the same as the other and that both equally receive services (Frederickson 1997). This presumption may be convenient, but Frederickson argues that such a presumption is both illogical and inaccurate. He points to social inequities such as wealth disparities and how certain groups have received preferential treatment because of others' lack of economic and political resources. When a service would enhance social equity but not be considered efficient or economical, this creates a conflict with traditional public administration values. Frederickson writes, "To say that a service may be well-managed and that a service may be efficient or economical still begs these questions: Well-managed for whom? Efficient for whom? Economical for whom?" (p. 37).

If deeply inequitable public service continues in the long term, Frederickson (1997) argues, this is a threat to this and other political systems. "Continued deprivation amid plenty breeds hopelessness and [its] companions, anger and militancy. A public administration that fails to work for changes that try to address this deprivation will likely eventually be used to oppress the deprived." New Public Administration strives for this equity, which Frederickson argues is needed for political systems to survive (1997, pp. 37–38).

The late American political philosopher John Rawls, Frederickson writes, is the "foremost theorist supporting a concept of equity in government" (1997, p. 38). Justice is the most dominant principle in Rawls' view. Rawls rejects the notion of "the greater good" of society outweighing the need to treat citizens equally. Rawls wrote:

> For this reason, justice denies that the loss of freedom for some is made right by the greater good shared by others. . . . . .rights secured by justice are not subject to political bargaining or to the calculus of social interest. (as cited in Frederickson 1997, p. 39)

Public meetings and hearings have become the predominant format for citizen participation (Fung 2006). However, Rimmerman (2011) and Archon Fung, the academic dean and Ford Foundation Professor of Democracy and Citizenship at the Harvard Kennedy School of Government (2006, 2015), point out that the traditional public meeting format is one favoring the wealthy and otherwise more socially advantaged. In theory, traditional citizen participation often creates *less* equity.

Rimmerman (2011) writes that more affluent and more educated citizens prefer the traditional format, but disadvantaged people, particularly in educational level, find it intimidating. Apathy, Lucie Laurian, an urban planning scholar at the University of Iowa (2004), argues, is not the main reason for poor attendance at public meetings. In her study involving toxic waste cleanup hearings, she found that only 9% of those who did not attend meetings did so because they believed they could do nothing to create positive change. The vast majority was not even aware of the

meetings, and others could not attend because of their work schedules or family obligations. Fung (2006, 2015) points out that because more powerful people attend and speak at government meetings, the policies the most powerful in society favor often prevail.

Marginalized groups often engage in outlaw citizenship because, when done properly, outlaw citizenship is very effective – particularly when it selects activities and figures that gain positive media attention (Rimmerman 2011). Rimmerman points to the US Civil Rights Movement and the nonviolent civil obedience activities such as the lunch counter sit-ins as positive examples. When this gained larger audiences (particularly the news media), the peaceful nonviolent protesters' actions as compared to the unruly crowds and aggressive police surrounding them garnered compassion for the protestors and much greater support for their cause.

## Outlaw Without Borders: Globalization Fueling Outlaw Citizenship

As mentioned with some of the examples above, outlaw citizenship is not a strictly American phenomenon. However, globalization's effects on outlaw citizenship go farther, with disenfranchised groups learning from their counterparts abroad. After elements of the preconscious (Akram 2014) rupture habitus and disaffected citizens respond with outlaw citizenship (as cited by King and Nank 2015), the types of outlaw citizenship they utilize often come from outside their nations' borders.

This happened long before online communication. During the US Women's Suffrage Movement, the suffragists visited the United Kingdom and met with the UK's suffragettes, such as Emmeline Pankhurst and her followers, and later adopted the suffragettes' more militant tactics, according to Sandra Adickes, an American professor emeritus in English at Winona State University in Minnesota (Adickes 2002). Adickes writes that Alice Paul, a young US suffragist with experience in the Pankhurst campaign, inspired American women to adopt the British suffragettes' more extreme tactics such as "climbing fences, chaining themselves to fences, and burning 'watch fires' in front of the White House," and Adickes argues that these actions ultimately led to the US Constitution's Nineteenth Amendment's ratification, which gave women the right to vote (p. 675).

In the modern era, online communication, particularly social media, has greatly enabled and transformed outlaw citizenship and made it even more global. This has especially been the case since Donald Trump was elected President of the United States and protests from numerous groups have erupted – along with existing social movements such as Black Lives Matter and protests at the Standing Rock Sioux Tribe's Native American reservation in North Dakota. One tactic groups such as women and immigrants have utilized is general strikes – a practice borrowed from Europe – according to Emily Crockett (2017), a journalist for online publication Vox, and Francine Prose, a former president of the PEN American Center, an association of prominent literary writers and a member of the American Academy of Arts and Letters and the American Academy of Arts and Sciences (2017). Prose (2017) explains that general strikes are days when no one goes to work, shops, or spends money to demonstrate citizens' political and economic power.

Crockett (2017) explains that, given such factors as declining union strength in the United States, general strikes could not be as large as some seen in Europe. However, some city governments, school districts, and other organizations shut down on March 8, 2017, for A Day Without a Woman. Technology and related organizing have made such activities much more plausible, with certain studies showing that more women were motivated to attend the January 21, 2017, Women's March by Facebook rather than friends and family. Just as Europe's general strikes sparked activities like A Day Without a Woman, the national Women's March in Washington, D.C., inspired "Sister Marches" across the United States and abroad, with Sister Marches in cities such as "Sydney, Berlin, Nairobi, and Cape Town" marching "in solidarity with the marchers

in Washington and in opposition to the values they think Trump represents," according to Laura Smith Spark, news desk editor for CNN (2017).

## Conclusion

Public administrators across the globe must confront outlaw citizenship – particularly when the roots of it are almost always evident before it erupts. They now have the additional challenge of disaffected citizens who can more quickly connect with other like-minded people – locally, nationally, and internationally – and adopt new techniques and connect with new influences. Though confronting disaffected citizens and engaging them in a more constructive dialog may be difficult, it is not impossible. Public administrators must know the barriers both they and citizens alike have in creating such a dialog and work to repair them. Otherwise, no constructive change will be made.

# Outsourcing Contract

Joseph A. Pegnato
U.S. General Accountability Office, Ashburn, VA, USA

## Synonyms

Contracting out; Farming out; Offloading; Privatizing; Public-private partnerships

## Definition

Outsourcing is the transfer of some internal agency activity or operations to an external contractor workforce often to reduce costs or improve efficiency.

## Introduction

Outsourcing of government work occurs at all levels of government, federal, state and local.

Because of the many dimensions of outsourcing, this discussion will be limited to federal outsourcing. Outsourcing of government work is not a new practice. During the Revolutionary War, the U.S. Army contracted for supplies. Scholarly interest in outsourcing got off to a slow start. It is now the subject of intense discussion, research and debate. H. George Frederickson calls outsourcing the public administration challenge of our time.

## Outsourcing Background

"Third party government (i.e., the third party being the outsourced contractor) is the single most important factor in the organization and management of the federal government and is of growing importance at the state and local levels" (Frederickson 2007). According to Frederickson, the reforms of the Progressive Era (1890s to the 1920s), such as merit based civil service systems and strong regulation of business were reactions to corporate excess and government corruption. However, by the middle of the twentieth century, the consensus was growing that businesses were over regulated. As a result, businesses were de-regulated, governments were cut back and outsourcing became very popular during the second half of the twentieth century.

Outsourcing became even more popular during the first half of the twenty-first century. Moreover, it will continue to grow because the federal government has no choice. The political reality is that the federal workforce will never be allowed to grow to keep pace with the increase in scope of federal programs. There is no political support for increasing the number of federal employees. Consequently, a large contractor work force will be necessary to fulfill the missions of legislatively mandated programs. The contracting genie will never be stuffed back into the bottle.

Official federal government policy since 1955 has been to acquire products or services from the private sector instead of producing such products or services in-house. It is assumed that the private sector can produce these goods and services at a lower cost. In 1966, this policy was encapsulated in Circular A-76 issued by the Bureau of the Budget (Bureau of the Budget 1955). Circular A-76 has been continuously revised to reflect the policies and politics of various administrations.

## Does Outsourcing Save Money?

In *Sharing Power: Public Governance and Private Markets*, Donald F. Kettl cites a vast body of literature suggesting that government for various reasons is less efficient in providing services than the private sector (Kettl 1993). But the Economic Policy Institute (EPI) called the evidence to show cost saving sorely lacking. According to EPI, the studies that show outsourcing will save money are not designed to produce such evidence.

It has been argued that competition between federal employees and contractors for the right to provide various government services will lead to huge savings for taxpayers and a more efficient government. However, claims that savings range from 20% to 30% have never been substantiated. One example of estimated savings was reported in Fiscal Year 2003 by the Office of Management and Budget. OMB predicted $1.1 billion of savings over 3–5 years. Such estimates of savings are difficult to verify. Donald F. Kettl suggested that the advertised benefits of outsourcing are often oversold.

The House Appropriations Committee reported that the Forest Service spent $23.6 million on outsourcing studies for salaries, contracts, travel and training in FY 2002 and FY 2003, while saving only $5 million. The savings from outsourcing are often negated by the costs associated with work needed to outsource the work.

No definitive study has been issued to date showing hard dollar savings resulting from outsourcing.

## The Politics of Outsourcing

E.S. Savas is a strong believer in outsourcing. Because government growth threatens democracy in Savas' view, he believes it is necessary to try to constantly shrink government (Savas 1982, p. 2). According to Savas, government has a natural tendency to grow because of the insatiable demand for more services. He argues that contracting out more of what government does is

an effective technique to reduce the size of government. Unchecked growth, in his view, could threaten individual rights and lead to tyranny.

It should be obvious that outsourcing has a political dimension. One strong indication of how the political winds affect outsourcing can be seen from the approach employed by President Barak Obama's administration. In an attempt to reverse a growing outsourcing trend, Obama's Director of OMB directed all executive branch agencies to consider in-sourcing. The OMB Director expressed a concern that an over reliance on contractors can adversely affect government performance as it can erode in-house capacity.

With the exception of the Obama Administration, every administration since the Reagan Administration has taken steps to reduce the size of the federal workforce. When elected officials limit the size of the federal workforce, they are sending a message to voters that government growth is being held down. But this is a disingenuous message as these same officials are not limiting the size of federal programs and budgets. The disconnect between the size of the federal government and the size of the federal workforce to manage the government is made up by outsourcing federal jobs. This arrangement helps perpetuate a myth that government growth is being held in check. Those who oppose outsourcing argue that outsourcing federal jobs to government contractors is a reward given by outsourcing actors to their political allies.

## Outsourcing Workforce Issues

Is there sufficient acquisition workforce to award and monitor contracts for the outsourced work? The answer to this important question should be yes, but it may be no. According to the Federal Acquisition Institute, when the federal workforce was downsized in the 1990s the federal acquisition workforce was similarly downsized. The acquisition workforce decreased almost 17%; it fell from 67,000 in 1992 to 56,000 in 2001. Moreover, the acquisition workforce reductions were so severe, the DOD Inspector General warned that the staffing cutbacks would adversely affect the ability of the workforce to handle its immense procurement workload.

A special commission reviewing Army contracting reported in 2007 that the Army did not have sufficient personnel to manage its exploding workload. The commission called for immediate hiring of over a 1,000 contracting staff.

"The capacity and the capability of the federal government's acquisition workforce to oversee and manage contracts have not kept pace with increased spending for increasingly complex purchases," according to a GAO 2010 report. In 2009, Public Law No. 110-417 (Section 869 of the Duncan Hunter National Defense Authorization Act for Fiscal Year) was enacted; it directs OMB to develop a plan to increase the size of the acquisition workforce.

Another workforce issue is the retirement eligibility of the acquisition workforce. According to the Federal Acquisition Institute (FAI), 15% of the acquisition workforce was eligible to retire in 2008. Moreover, in 2015 FAI projected retirement to explode to 54%.

## Inherently Governmental Issues

Those governmental functions requiring the exercise of discretion in applying governmental authority are generally considered to be inherently governmental activities. One of the first attempts to define what core functions must remain in-house and should be performed by federal employees and what functions could be contracted out was the 1992 Office of Federal Procurement Policy Letter 92–1, Inherently Governmental Functions. What is inherently governmental is also prescribed in Federal Acquisition Regulation FAR 7.5, Inherently Governmental Activities. This regulation lists examples of inherently governmental activities to include command of military forces, conduct of foreign relations, direction of federal employees, awarding contracts, determination of budget policy, drafting of Congressional testimony, etc. Functions not considered to be inherently governmental include workload modeling, efficiency studies, feasibility studies, inspection services, building construction services, etc.

The line between what is inherently governmental work reserved for federal employees and what is appropriate to be contracted out is shifting. Twenty years ago, it would be rare to find contractors working in contracting offices supporting the awarding and managing of government contracts. Today it would be unusual if there were no contractors in a contracting office. This is now commonplace even though the Federal Acquisition Regulations list awarding and administering contracts as inherently governmental tasks that should be performed by federal employees. Clearly the line between what is and what is not inherently governmental is unclear.

The definition of what is inherently governmental affects outsourcing decisions. Differing interpretations of what can be outsourced obviously leads to vastly different levels of outsourcing. Some say a liberal interpretation of what can be outsourced can harm federal agencies. Others say a conservative interpretation can lead to a government without the capacity to perform its missions.

On February 1, 2003, the space shuttle Columbia blew up. Apparently, NASA management readily accepted contractor technical advice that the heat shield had not been compromised. The technical advice had been provided by a contractor with a large financial interest in the shuttle's success. There is no answer to the question of whether the contractor conflict of interest got in the way of NASA management receiving unbiased recommendations on the shuttle's status. It does seem clear that outsourcing complicated effective NASA decision making. The earlier 1986 Challenger tragedy seems to be an echo of the Columbia contractor conflict of interest scenario. Moreover, NASA may not have had any choice but to become over reliant on its outsourced contractor workforce. The NASA workforce was downsized by 25% in the 1990s.

## Outsourcing Accountability

When federal agencies outsource work, they can avoid various governmental constraints. Since contractors are not required to follow the same legal rules concerning hiring and firing as agencies must. It is easier to fire a poorly performing contractor employee than a government employee who is not performing.

Throughout the history of federal government outsourcing, Don Kettl sees a companion theme: waste, fraud and abuse, and weak contract management. He also believes that outsourcing has led to an abrogation of government responsibility. Many Government Accountability Reports have documented a significant number of contract management performance problems associated with extensive contracting out. Instead of making government perform better and more efficient, outsourcing has done the opposite and exacerbated the problems of capacity building, according to these GAO reports.

Some of the federal laws that are designed to protect citizens against the abuse of power by government officials such as the Hatch Act and the Freedom of Information Act do not apply to contractors. Since there is less legal accountability for an outsourced contractor than a government employee, the potential for fraud is increased.

The Challenger and Columbia disasters discussed above are prime examples of how accountability can be compromised by excessive outsourcing.

## In-Sourcing

What is in-sourcing? Under in-sourcing, work that had been outsourced to contractors would be transferred back in-house to be performed by government employees. DOD was authorized to bring work back in-house under the 2008 Defense Authorization Act. One of the first initiatives of the Obama administration in 2009 consisted of an emphasis on in-sourcing. Under Obama, OMB directed all executive branch agencies to consider in-sourcing as a workforce tool. This Democratic reverse outsourcing push underscores the politics inherent in all outsourcing activities. It reveals how political winds can directly affect outsourcing policies.

## Conclusion: Finding the Right Outsourcing Balance

There are five to six contractor employees for every federal employee; is this the right outsourcing balance?

Finding the right outsourcing balance is not a new question. A 1962 task force assessed the government's increasing reliance on contractors doing research and development. The task force concluded that the growing contract workforce was eroding the line between public and private and was reducing the government's ability to accomplish its mission (Light 1999, p. 144).

How do you find the right balance? Outsourcing decisions should be made using solid management judgment and should not be based on political bias. The liberal view is to contract out as little as possible; this protects the jobs of federal employees. By contrast, the conservative view assumes that the private sector is more efficient than the public sector leading to contracting out as much as possible. Moreover, reducing the size and influence of government is compatible with a conservative outsourcing approach. In any case, it is a fact of government life that government needs to contract for expertise it does not have in-house to accomplish its missions. For example, it does not make sense for the government to try to develop in-house all of the capability to design and build complex military weapon systems. Outsourcing makes sense when the government function to be contracted out is not a core function and the private sector can do it more efficiently. It doesn't make sense to outsource work if the government doesn't have the capacity to effectively oversee that work. Moreover, excess outsourcing can lead to the government losing its capacity to perform the outsourced function as well as unaccountable outsourcing.

It is clear that outsourcing is increasing at all levels of government. If government intends to rely very heavily on outsourced contractors, and that seems to be the case, it must invest more heavily in acquiring the resources to manage this increased contractor workforce. During the 1990s the federal government did just the opposite, slashing the procurement workforce especially in DOD. The correct outsourcing balance will never be attained if outsourcing decisions are largely determined by politics and arbitrary quotas. Careful workforce planning will help produce a healthy outsourcing balance.

If outsourcing is simply a disingenuous tactic to reduce the size of the government or to disguise the "true size" (Paul Light's term), the right outsourcing balance will never be achieved. To reduce the size of government or to reduce the size of the government workforce, just reduce the size of government. Good luck with that as the American people have shown no interest in that. The government needs many employees and contractors to fulfill its very large and important responsibilities. The appropriate outsourcing balance should be based on such values as economy, efficiency and democratic accountability (Pegnato 2010, p. 100).

## Synonyms

Contracting out; Decentralization; Externalization; Privatization; Subcontracting

## Definition

Outsourcing is defined as the procurement of products or services from sources that are external to the organization.

## Introduction

Government organizations are not too different from private firms in the sense that both have cost saving and operational efficiency as their core objectives when carrying out their functions and mandates. It is with these objectives that public managers have begun to reevaluate their roles, examining which public sector functions they should be engaging in or outsourced. What is more is that budgetary pressure and economic uncertainty have made the calls for cost saving in public spending even more important than ever before. Government agencies worldwide are seeing outsourcing as a viable solution to cut public spending and a means to gain value-adding benefits to the services delivered to their people. For that reason, outsourcing has become accepted as one of the crucial ways of delivering public services over the last decade.

The current literature defines outsourcing or contracting out as a contractual arrangement by which an external private provider assumes responsibility for delivering public services at negotiated prices in accordance with predefined performance criteria. Under such an arrangement, some or all of the decision-making rights, activities, business processes, and public services are delegated or transferred from a government undertaking to an external service provider, who then develops, manages, and administers those activities according to certain performance standards, agreed-upon deliverables, and outputs set out in a contract. That being so, the responsibilities for providing government goods and services are shifted from the public sector as a principal or a purchaser to the private sector as an agent or a provider, thereby allowing governments to concentrate on their core businesses or what they can do best, such as delivering stronger leadership, and implementing continuous benchmarking for performance improvement.

Governments in the industrialized countries such as the United Kingdom, the United States, Australia, and New Zealand have been in the forefront of the outsourcing phenomenon. The range of government activities which have been contracted out in these countries include cleaning, waste management, mail services, security, and a number of human resource management (HRM) components such as payroll processing, benefits administration, and recruitment. In this paper, we concentrate on HRM outsourcing – an area which has been gaining momentum worldwide.

## Theoretical Viewpoint

The current literature suggests that the move to a more entrepreneurial focus for governments has been reinforced by New Public Management (NPM). This governance concept is basically about streamlining government functions and services by adopting best practices and methods from the private sector. NPM involves prioritization of efficiency and cost-effectiveness in spending taxpayers' money, valuing expertise in performing certain government functions, and treating citizens as customers. NPM is recognized by a number of international funding agencies such as the World Bank and International Monetary Fund, who have included increasing government

efficiency and effectiveness in their policy recommendations for member countries.

Apart from NPM, the shift in the mode of delivering public services is supported by the agency theory. The theory analyzes how the relationship between the principal or the purchaser (in this case, the government purchasing the service) and the agent or the provider (the organization or person providing the service, such as the external contractor) should be structured. It comes from the notion that a contractual relationship between the purchaser and the provider is the optimal way to ensure that the provider will meet their obligations to the principal without acting in his own interests through specifying in the contract the outputs to be provided and providing clear performance incentives and penalties for the provider.

## Outsourcing HRM Activities and Drivers for Outsourcing

Government organizations are seeking to limit their involvement in functions that do not directly contribute to but are instrumental for ensuring that all citizens will be reached by the services and benefits that they provide. For that reason, government organizations are motivated by the need for freeing their resources from functions that do not enhance their core competencies. HRM is one of the processes that are indispensable to the operation of government organizations, which involves payroll, time and attendance, performance appraisals, benefits administration, recruitment, absence management, etc. However, such processes are resource intensive and require a great number of trainers and staff. Worst still, public HRM systems have been considered by many as being bureaucratic, inefficient, inflexible, and rule bound. Outsourcing offers a way-out for government organizations to maximize the value of their services and products, expand their capacity to deliver public services that citizens are entitled to, and add value to the services that they provide to their end users (i.e., citizens). These drivers for outsourcing HRM functions can be classified into internal and external ones. Based on the current literature, and as is presented in Table 1, 11 major drivers for outsourcing has been drawn up and are summarized below. It is noteworthy that outsourcing is unlikely to occur

**Outsourcing of Human Resource Management, Table 1** Driver for outsourcing

| Driver for outsourcing | Description of the driver |
|---|---|
| 1. Cost saving | Reducing the cost of in-house HRM activities for getting more resources such as time and manpower |
| 2. Professional manpower provision | Sufficient professional for supervising and choosing the best alternative of vendor |
| 3. Transactional accountability | Traditional accountability can be transformed into private sector that the role of government changes to be monitored |
| 4. Improving quality | Contracting out about the HRM activities to the specialist HRM companies in order to get a higher result on the performance |
| 5. Market provision | Market has the sufficient professional and specialist to afford the outsourcing matters that can perform better in in-house activities |
| 6. The size of organization | The small and medium organizations may not have sufficient resource to employ a full-time staff for HRM activities |
| 7. Globalization | Globalization helps to homogenize culture regarding governance without government, which shares responsibility with state and for profit or nonprofit organization |
| 8. Administrative efficiency | Traditionally, government has been treated as bureaucracy, which is inefficiency that should involve market organization in order to increase productivity |
| 9. Strategic HRM management | Outsourcing the subsidiary and administrative work of HRM could separate more resource for headquarters to handle with the strategic HRM planning |
| 10. Flexibility | Enabling new personnel to be hired quickly and poor performers dismissed more easily by using external providers |
| 11. HRM shared service | Allowing the customer to define the level of service and decide which to take up |

when the motivators are purely internal or external.

Figure 1 illustrates the outsourcing process, in which organizations assess and identify their core competencies, focus on their core functions, and strategically outsource their ancillary activities to external service providers who have access to new technology, expert knowledge, and skills. A core competence, according to a well-known definition by Hamel and Prahalad (1996), refers to a collection of skills and technologies that enables organizations to provide a particular benefit to customers, sustain competitive advantages, and achieve strategic goals. The concept proposes that organizations should base their strategies around their core competencies to transform, reengineer business processes, and achieve competitive advantages. Nevertheless, the extent of HRM outsourcing varies from organizations to organizations, depending on their needs and the range of their HRM functions and specific services. Deciding on which HRM activity to be outsourced is not always straightforward. HRM outsourcing is more than a decision to purchase elements of operation but a strategic choice. It takes two forms, namely, substitution and abstention. Substitution means that in-house service provision is discontinued in favor of procurement from an outside supplier. This is commonly found in one single element or high-volume repetitive HRM functions such as annual enrolment processes and updating of employee data. On the contrary, outsourcing through abstention need not be limited to activities shifted to an external provider but may also arise when a HRM function is not provided in-house. In the following section, we shall examine what types of HRM activities should be outsourced.

## Which HRM Function to Outsource?

One major issue in outsourcing HRM activities is to decide what types of HRM activities should be outsourced. To make such a decision, organizations have to consider the possible impacts of outsourcing their activities on their performance. In order to do so, they need to differentiate core activities from noncore activities. Some scholars such as Finn (1999) and Ulrich (1998) suggest that core HRM activities are transformational work that creates unique value for employees,

**Outsourcing of Human Resource Management, Fig. 1** Outsourcing process

customers, and investors, which include top-level strategies, HRM policies, and line management responsibilities (e.g., appraisal and discipline), while noncore HRM activities are transactional work that is routine and standard and can be easily duplicated and replicated, including specialist activities (e.g., recruitment and outplacement), routine personnel administration (e.g., payroll and pension), and professional HRM advice (e.g., legal advice related to employment regulations). A 1999 survey was conducted on 3,964 organizations in Europe, focusing on four areas of HRM outsourcing: training and development, recruitment and selection, pay and benefits, and workplace outplacement/reduction. It was found that training and development activities were the most common service bought in by those organizations, possibly because they were considered noncore functions or because the organizations lacked the expertise to handle them internally. Other scholars such as Conklin (2005) refer the issue of contract clarify to explain why outsourcing tends to concentrate on certain areas of HRM activities. They explain that HRM activities differ in respect of the clarity of specification that they allow in the contract of service, and so some areas of HRM services such as payroll processing, attendance and workforce administration, employee benefits and plans, and recruitment have a higher tendency of being outsourced because their terms are relatively easy to define, while other HRM activities relating to strategy planning such as training delivery, awards, and incentives programs are less likely to be outsourced since their conduct is difficult to specify and performance standards difficult to quantify.

## Extent of HRM Outsourcing and the Situation of Hong Kong

Evidence from professional and practitioner publications indicates that HRM outsourcing has increased substantially over the last decade. Globally, outsourcing saw a dramatic growth of 35% throughout the year, contributing up to US$200 billion to the global market by 2000. An American Management Association survey reports that 77% of the firms surveyed in 1996 had outsourced some of their HRM activities, a rise from 60% in 1994. Like private companies, government organizations worldwide have been capitalizing on the outsourcing trend, and Hong Kong is among the bigger spenders in outsourcing public sector processes.

Like many governments, the Hong Kong Special Administrative Region Government (HKSARG) has implemented a range of transformational public sector reforms since 1989. Upholding the principles of "Big Market, Small Government" and "Market leads, Government Facilitates," the HKSARG has adopted the "3R1M" approach when implementing reforms, namely, *r*eprioritizing the provision of services, *r*eorganizing the structure of government departments, *r*eengineering procedures, and *m*aking full use of the market. According to some scholars such as Scott (2010), the growth of outsourcing in HKSARG has noticeably signified the post-1997 government's emphasis on private sector involvement in the delivery of goods and services. A 2006 survey revealed that although the number of contracts awarded had decreased, the HKSARG had about 4,000 outsourcing contracts with a value of about HK$200 billion, over six times the value of contracts in 2002. In the 2010 outsourcing survey report, the annualized expenditure on outsourcing was even reported as equivalent to 16% of the HKSARG's total estimated expenditure in 2010–2011 (Efficiency Unit 2010). Twelve responding departments reported that cost savings achieved by outsourcing HRM were 31% on average, as compared with in-house provision (Legislative Council Panel on Public Service 2011). Outsourcing is appealing to HKSARG because it helps meet its intent to involve the private sector wherever possible. In addition, it shrinks costs because the private sector may provide some services at a lower price than the public sector does. What is more, outsourcing does not divest the responsibility of providing the function from the government, and the government is still held accountable for the standard of service. That is consistent with the Efficiency Unit's statement, that is, "Departments should note that they can outsource services but not the ultimate responsibility."

## Problems with HRM Outsourcing

Regardless of the rising popularity of outsourcing, the practice still has a few drawbacks. First, there are questions about how to maintain the continuity of skill supply and the retention of in-house knowledge and expertise. Usually, governmental organizations seek outsourcing to save operational costs, assuming that the private sector will carry out public sector activities to ensure the delivery of key skills. That can result in skill loss and have a negative impact on competitiveness. Another major concern with outsourcing is the loss of quality. Employees often assess service quality by comparing their expectation of the resulting service under the proposed change with their view of what the services should be or with the services that they used to have. Transferring certain HRM services from in-house to the hands of an external service provider unavoidably disrupts the continuity of the services. In fact, there have been reports in the media and in practitioner journals on the failures of outsourcing resulted from unfulfilled promises and expectations. Therefore, the disadvantages should be taken into account when governments decide whether or not to outsource HRM activities.

## Conclusion

Despite the attraction of using outsourcing as a way to streamline government functions, achieve efficiency, and save operational costs, the debate still rages over the implications of leaving certain processes in the hands of the private sector. Outsourcing reshapes some degree of authority and control that would otherwise be absolutely held by governmental institutions. Evidence suggests that outsourcing has its capability to improve service delivery, increase savings on public spending, and improve public services. Nevertheless, outsourcing also poses significant challenges that must be managed to make outsourcing a success, including the potential loss of skill and expertise along with service quality. Hence, the approaches and applications of outsourcing should be tailored to fit the unique characters and needs of governments and should line up with their strategic goals.

## Synonyms

Commissioning; Contracting out; Externalization; Procurement

## Definition

Outsourcing means that an organization interrupts the internal production of goods or services and starts procurement from outside providers.

## Introduction

Outsourcing occurs when an organization decides to interrupt the internal production of goods or services and delegates that task to an outside provider. Consequently, outsourcing implies a separation between a purchaser and a provider, i.e., the purchaser-provider split. In general, organizations that outsource activities aim to achieve higher profitability by using fewer in-house resources (Barthelemy and Quelin 2006).

Applying this definition to the public sector, outsourcing means that the government which outsources the delivery of public services becomes the purchaser, while the external organization supplying the public service is the provider. Inspired by the principles of New Public Management, over the last 30 years, many governments in various countries have outsourced the delivery of public services with the aim of achieving efficiency gains in the public sector (Bovaird 2016). The decision to outsource public services is often a political decision driven by one or more of the following reasons: to reduce government costs, to achieve value for money in terms of maintaining the same quality levels by saving money, to increase the quality levels of public services, to be innovative, and/or to access expertise that is not available in-house (Greve 2008; Joha and Janssen 2010; Muench 2011).

The OECD explains that governments which choose to outsource the production of goods and services have two possibilities (OECD 2015). First, governments can purchase goods and services to be used as inputs into their own supply chain (i.e., intermediate consumption). This kind of outsourcing occurs when governments use external organizations to provide support services or perform back-office functions (OECD 2011). Secondly, governments can pay an external organization to provide the goods and services directly to the end user. Home care provided by the corporate sector or nonprofit institutions is an example of this second kind of outsourcing (OECD 2011).

According to the data collected by the OECD, in 2013, government outsourcing represented, on average, 8.9% of GDP. This share varied greatly across OECD countries, ranging from 17.1% in the Netherlands to 3.0% in Mexico. Among OECD countries, Belgium, Japan, Germany, and the Netherlands dedicated the largest shares (over 60%) of their resources to outsourcing goods and services through direct third-party provision. In contrast, Denmark, Israel, and Switzerland spent the majority of outsourcing in intermediate consumption (OECD 2015, p. 80).

Greve (2008, p. 14) reports that the range of services outsourced in OECD countries is very wide. These include blue-collar support services (building cleaning, catering), professional services that are considered ancillary to the core mission of the ministry or agency (information technology), and core government functions (prisons).

## Contracts Regulating the Purchaser-Provider Relationship

Outsourcing trends have led to the establishment of several purchaser-provider relationships and activated fundamental changes in public governance arrangements. Such changes are related to the move from the traditional direct service provision, i.e., in-house delivery through the hierarchy of public sector organizations, to market-based competition and contractual relationships (Erridge and Greve 2016). In order to engage external providers in delivering public services, the purchaser has to sign a contract with them. It follows that the contract is the key document around which communication between purchasers and providers revolves (Greve 2008).

It is stated that outsourcing requires a sufficiently dense contract (i.e., complex contract) with many clauses including penalties, incentive, and monitoring, in order to minimize risks of opportunistic behaviors on the provider's side (Barthelemy and Quelin 2006). In other words, the contract is a formal written agreement which states the term of delivery of a service, clarifies duties and rights, and serves as a control instrument (Argento and Peda 2015).

The importance of establishing and managing effective contractual relationships is related to the

risks deriving from outsourcing. Greve (2008, p. 13) identifies the following risks of outsourcing. Firstly, if contracts do not cover a sufficiently long period of time (i.e., are short term) and the supplier has the chance to maximize profits, then outsourcing public services may lead to quality degradation. In addition, outsourcing implies a change in accountability structures because control becomes more difficult in the case of purchaser-provider split. Governments do not execute a direct control and have to consider the contract ruling their relationship with the providing organizations. Finally, outsourcing may provoke a general lack of transparency if the providers do not have specific obligations regarding their openness to the public about their actions and outcomes.

The risks depicted above indicate that in order for outsourcing to be effective, governments should be able to write and enforce proper contracts (Brown and Potoski 2004). Evidently, contract design is crucial to successful outsourcing and reduces opportunistic behavior on the part of the service provider. Contracts should stipulate clear targets, service quality standards, and price mechanisms and – at the same time – also assure sufficient levels of profitability for the public service provider (Argento and Peda 2015). However, it is recognized that public services entail complexity because they pose difficulties in terms of both measurement and objective setting. The more complex the goals of a service are, the more challenging it is to contract that service out because it is harder to specify a clear contract (Greve 2008, pp. 14, 29).

Apart from contract design, another element to consider is the process of awarding the contract. After having collected all the bids of the candidate providers, governments have to choose the provider – that will be delivering a public service in a specific area for a certain period of time – on the basis of previously announced criteria. However, research has found that the award process might not be that neutral. Greve (2008, p. 36), for example, points out that – even if the awarding process is regulated and should be based on open principles – in practice "the government may also take into consideration the local commercial environment and may want to give the contract to well-known providers."

Contracting for public services is considered by Erridge and Greve (2016) to be an integrated part of public service delivery in most European countries and requires governments to develop contract management skills. These authors suggest that contract management cannot take place by considering the contractual relationships one by one, but needs competences in managing providers within an overall portfolio of contractual relationships (Erridge and Greve 2016, pp. 95–96).

Despite the abovementioned challenges, efficient contract management is required to reduce transaction costs (Brown and Potoski 2004). Such costs include the administrative resources needed to manage the bidding and award processes, implement the contract, and perform adequate oversight. If goal conflicts, information asymmetry, and opportunism on the side of the provider are high, then the transaction costs could potentially raise beyond levels needed for internal oversight (Girth et al. 2012, p. 888), making the outsourcing choice more expensive than in-house public service provision.

In addition, contract management is a complex affair because it does not only involve compliance with the formal rules settled in the contract but also requires attending the informal rules and expectations that are attached to contracting out (Greve 2008, pp. 47–48; see also Muench 2011). Indeed and especially in the context of public service delivery, "contracting involves a number of actors besides the main parties (i.e., the purchasers and the providers). These include the public that has to consume the services, the regulators who have to oversee the purchaser and the provider, the politicians who lay out and revise the contracting policy and the various international organizations that are framing the rules for contracting to take place" (Greve 2008, p. 180).

Finally, in line with the arguments by Brown and Potoski (2004), effective contracting is compromised if there are not enough providers in the market to ensure sufficient levels of competition.

## Competitive Versus Noncompetitive Public Service Markets

It is argued that competition is critical to outsourcing success (Girth et al. 2012). Also Greve (2008) maintains that contracting out rests on the assumption that competition is required for effective public service delivery. The idea is that public services should be produced on the market instead of being produced by public organizations in a hierarchy. External providers should compete for contracts, and the contract should be awarded to the bidder with the best combination of price and quality (Greve 2008, p. 29).

It follows that a functioning market would require a sufficient number of providers that can easily enter and exit the market. According to Girth et al. (2012, p. 891), competition is guaranteed if there are two or more alternative public service providers. Unfortunately, well-functioning markets cannot be taken for granted (Brown and Potoski 2004). Research conducted in the US local government context indicates that competition is weak in most local government markets. Noncompetitive public service markets can compromise efficiency gains and contribute to increase transaction costs because governments need to find (and retain) providers and exercise greater oversight (Girth et al. 2012, pp. 887, 894). This also means that governments tend to manage public service markets by acquiring information through various channels (Brown and Potoski 2004).

Girth et al. (2012) found that the competitiveness of public service markets depends on the location and type of services contracted out. Concerning location, these authors maintain that rural areas, metro core communities, and large cities do not seem to be good candidates for contracting out public service delivery. In such locations, public service markets are not competitive enough. On the one hand, rural areas, because of their small size and sparse settlement, are not very attractive to private providers. Metro core communities, instead, have more complex service requirements that limit the supply of private providers. On the other hand, large cities may enjoy internal economies of scale that can promote efficiencies in direct government (in-house) delivery, making outsourcing unnecessary. It follows that suburbs are better candidates in terms of contracting out public service delivery because they represent average-sized governments, and there are enough of them in a metro region to create a market for private providers (Girth et al. 2012, p. 889).

Concerning service types, Muench (2011) argues that different types of services affect the strength of competition and levels of contracting. The decision whether to outsource public service delivery or to provide public services directly in-house depends on various factors (Brown and Potoski 2004). Some of those factors are the level of uncertainty, frequency of transactions, institutional and legal frameworks, political environment, and necessity for long-term investments (Girth et al. 2012, p. 889). Accordingly, Brown and Potoski (2004, pp. 657–658) argue that less suitable candidates for contracting out are:

- Services that tend toward monopoly because the sole provider can afford the large asset-specific investments.
- Services whose complexity entails a difficulty in measuring and monitoring providers' activities and service outcomes. In these cases, the public service provider has information advantages over governments, making contracts more prone to failure.

Because levels of competition vary across service types and locations, governments choose different delivery forms and related contracting. When public service markets are noncompetitive and transaction costs are potentially high, the traditional in-house delivery model seems to be the common option. This is not surprising because the in-house provision can potentially limit some of the disadvantages of the purchaser-provider split. As stated by Bovaird (2016, pp. 69–70), "key advantages of the in-house model include the control which it appears to offer to local councillors and service managers, its flexibility when policies change, the absence of a profit charge by the external provider and the potential to embed the council's values more explicitly into the

service." In other words, in noncompetitive public service markets, the in-house delivery model is a common choice as governments may wish to maintain internal control.

Once it has been decided to outsource public service delivery, governments have different options (see also Joha and Janssen 2010; Muench 2011). The most common distinction is between for-profit providers (companies), nonprofit providers (e.g., voluntary organizations), other public organizations, and networks or consortia of providers (Greve 2008). The common trend is that local governments rely on for-profit suppliers when markets are more competitive and on intergovernmental contracting (i.e., contracting among municipalities) and nonprofit contracting when markets are less competitive (Girth et al. 2012).

Research findings indicate that public managers tailor their contract management efforts according to market conditions and service characteristics. In thin markets, public managers adjust contract type and oversight methods and devote resources to improving supplier markets when they can, with the objective of improving their position in the purchaser-provider relationship and enhancing accountability and service quality. In other words, public managers respond to suboptimal market competition by intervening with strategies designed to create, sustain, and enhance provider markets (Girth et al. 2012, p. 888). Public managers can stimulate competition in various ways. For example, "by segmenting service delivery into multiple contracts, by allowing public employees to compete against private providers, by keeping a portion of the service in-house to ensure there is always an alternative provider, or by recruiting new bidders from beyond the geographic boundaries of the service area" (Brown and Potoski 2004, p. 658).

However, the strategies that public managers employ to build and sustain competition for contracts often require tangible investments of administrative resources that add to the transaction costs of contracting in noncompetitive markets. For these reasons, public managers may purposely avoid for-profit contracting when the advantages of partnering with other governments – such as trust, common service cultures, and willingness to cooperate to maximize scale economies – offer the potential for reduced transaction costs and higher net benefits to the partners (Girth et al. 2012, p. 892). In fact, Brown and Potoski (2004) argue that public managers can reduce the market problems by acting in a collective way, that is, by collaborating with intergovernmental service delivery networks.

## Types of Providers and Collaborative Efforts

The discussion above shows that governments can outsource public service delivery to different types of providers (see also Joha and Janssen 2010; Muench 2011). Bovaird (2016) states that there is a great range of provider types available in many public services, enabling governments to find innovative and appropriate provision arrangements. Accordingly, Greve (2008) claims that public service providers differ in form and size, depending also on country-specific rules. In addition, they can operate at different levels of government, i.e., at the local, the national, and also the global levels (pp. 40–44, 101–107).

More specifically, Bovaird (2016, p. 70) lists the range of types of providers as follows:

- Private and third sector suppliers, i.e., for-profit and nonprofit providers
- Arm's-length management organizations
- Partnerships, such as joint ventures and other PPPs
- Joint public sector provider partnerships, consortia, and shared services
- User and community coproduction of public services

In addition and given also the lack of competition in many public service markets, over the years a move toward collaborative relationships, entailing greater levels of dialogue between purchasers and suppliers, has been observed in practice (Erridge and Greve 2016, p. 95). Collaborative working arrangements can be achieved through relational contracting which entails "mutual exchange and reciprocity, with long-term

negotiated relationships that involve trust, discretion, joint problem-solving, and information exchange, so that goal alignment is promoted and the difficulties of performance are transcended (Bovaird 2016, p. 71).

In line with the arguments by Erridge and Greve (2016), Girth et al. (2012, p. 890) find that local governments have incentives to establish a "nurturing and mentoring" relationship with public service providers in order to fine-tune incentives, facilitate mutual understanding, and improve performance. However, these authors remind that such nurturing and mentoring activities are costly and may cost more when markets are noncompetitive because there are few alternative providers and the government has an incentive to protect market supply. Under such conditions, effective contract oversight may require more frequent government exchanges with the provider.

Bovaird (2016) argues that the trend to establish more collaborative arrangements by governments outsourcing public service delivery (i.e., the public service commissioners) and also among providers leads to four potential strategic directions in public service outsourcing. The first direction occurs when individual governments outsource public service delivery to individual providers generating one-to-one commissioner-provider relationships. The second direction takes place when the single commissioner outsources public service delivery to a partnership of providers. The third possibility consists of various commissioners which jointly outsource public service delivery to a single provider. The fourth option is that different governments jointly outsource public service delivery to a partnership of providers (Bovaird 2016, pp. 70–73).

These strategic options show that governments have many outsourcing arrangements at their disposal, and none of them is in principle the best one because, as stated by Muench (2011), there is no solution that always fits all the needs at stake.

## Conclusions

Outsourcing the delivery of public services is a complex activity which entails ex ante decisions and ex post engagement. The arguments presented in the previous sections lead to the conclusion that outsourcing can be successful if well planned and executed as a strategic activity (Joha and Janssen 2010; Muench 2011). A strategic approach to outsourcing is paramount because the decision to outsource the delivery of public services to an external provider does not mean that governments are exempted from the entire responsibilities concerning public service provision (Argento and Peda 2015). Governments enter relationships with various types of public service providers which have to be managed and sustained over time.

The establishment of such relationships often relies on contracts ruling duties and rights of the parties involved in public service delivery (Greve 2008). Contracts have to be designed and implemented in order to ensure that the benefits expected from outsourcing (i.e., cost reduction, efficiency gains, quality improvements) are effectively achieved. The ultimate objective is to prevent opportunistic behavior on the side of the external public service provider (Argento and Peda 2015). Preparing contracts and monitoring their enforcement require governments to develop skills in managing contractual relationships (Erridge and Greve 2016).

Given that public services entail inherent complexities, the capacity to set clear and complete contracts can be compromised. In addition, research has shown that levels of competition in public service markets are often not optimal, leading to increased transaction costs and to the risk of missing the potential advantages of outsourcing (Brown and Potoski 2004; Girth et al. 2012). Over time, more collaborative approaches between governments and external public service providers have emerged. The mutual exchange of information, fine-tuning of targets, and trust are supposed to improve long-term performance (Bovaird 2016) and could therefore amplify the benefits of outsourcing.

Research findings show that governments can choose between different types of public service providers (Muench 2011). Depending on country-specific institutional and legal settings, competition levels, and type of services, governments can

choose among public service providers which differ in form and size and operate on different levels (Greve 2008). They can choose between for-profit providers and nonprofit providers but can also involve other public organizations and networks or consortia of providers. Indeed, governments do not necessarily establish one-to-one purchaser-provider relationships, but have various options at their disposal. They can make arrangements with other governments and jointly outsource public service delivery to one single provider or to a network of collaborating service providers (Bovaird 2016).

These final remarks show that questions connected to "how" to outsource, "what" service to outsource, and "with whom" and "to whom" to outsource are sensitive and not easily answered. Outsourcing is complex because it stems from a political decision that needs to take into account both advantages and risks connected to outsourced public service delivery, the specific context and institutional factors, and the impact such decision provokes on public value.

# Override Public Policies: What They Are and Why They Matter

Patrick O. Asingo
Department of Political Science & Public Administration, University of Nairobi, Nairobi, Kenya

## Synonyms

Legislative defiance; Legislative override; Veto override

## Introduction: Understanding Override Policies

Override policies refer to policies enacted through legislative override of a presidential veto. Unlike other policies, override policies are enactment in three stages. First, the legislature debates and approves a bill proposing policy legislation. Secondly, the approved bill goes to the president who refuses to sign it into law, and returns it to the legislature with a veto message stating reasons for rejecting the bill and suggesting amendments to be made before he approves it. In the final stage, the legislature rejects the presidential veto message and votes a second time to approve the bill.

This way, the legislature enacts override policies by defying the president's stand on that policy. Thus, override policies results from supremacy contest between the legislature and the president over control of policy agenda. The president uses veto to remind legislators that his wishes are paramount in policy legislation, while the legislature uses override to assert its supremacy over the president on matters of legislation.

## Override Policies as Part of a New Policy Typology

The recognition of override policy as a distinct category of public policies does not downplay but rather compliments the existing typologies. Indeed, "public policies have been classified using many criteria including the importance attached to policy by the government, the objectives of the policy, as well as the sectors [that] such policies are expected to affect" (Tukur 2013, p. 208). For instance, Theodore Lowi's celebrated classification of policies into *distributive*, *redistributive*, and *regulatory* policies is based on the type of politics a policy generates within a political system. In essence, Lowi classifies policies based on their broad objectives or intended outcomes so that policies intended to distribute benefits enjoyed by a few to a larger group or to the entire society are classified as *distributive policies,* and so on.

Nevertheless, it is also analytically useful to classify policies on the basis of how they are enacted. To appreciate the utility of classifying policies in this manner, it is important to recognize that policy formulation continues during implementation, and hence, how policies are enacted influences their implementation and outcomes. In the context of policy research therefore, *how a policy is enacted* can be an independent variable, which explains *how it is implemented and its outcome* (the dependent variable). However, a policy variable must be such that it varies from one policy to another. The variation in *how a policy is enacted* is what is captured by the new policy typology explained below. This clarification is important given that Lowi classifies policies in terms of *why* they are made (their objectives), while ignoring *how* they are made. Yet, the question of why policies are made is almost rhetorical: broadly speaking, policies are made to achieve policy outcomes and outputs that are congruent with their objectives. Moreover, there is lack of clarity in Lowi's typology. It is unclear whether Lowi classifies policies at the formulation or implementation stage. For instance, if a policy's stated objective is to distribute a benefit but fails to do so, is it still a distributive policy? How would a distributive policy that distributes some benefits while inadvertently redistributing others be classified? What stops a regulatory policy from concurrently being distributive? In any case, it would be more edifying for policy researchers to ask, for example, why some policy outputs or outcomes tend to match well with their goals than others rather than merely matching policy outcomes or outputs with their goals. Consequently, the new policy typology introduced in this article is a potential independent variable for many policy studies.

Under this new policy typology, policies enacted by the legislature and fully approved by the president are classified as *consensual policies.* This is consistent with McKinney and Howard's *functional policies.* In this regard, "*functional policies* are those that are enacted by the legislature and are supported by the executive arm of government" (Tukur 2013, p. 209). Most public policies belong to this category. Similarly, policies proclaimed by presidents or bureaucrats through legal avenues such as the executive orders are classified as *executive policies*. In the case of the USA, "presidents and their staffs consider executive orders an indispensable policy and political tool" (Mayer 2001, p. 7). Hence, "through executive orders, presidents have shaped the employment practices of government contractors, the travel rights of American citizen, foreign economic policy, private claims against foreign governments, and claims on natural resources on government land" (Mayer 2001, p. 35).

The third type of policies are *judicial policies*, comprising of policies that result from judicial policy-making, which simply refer to "policy

making by a judge" through judicial interpretations and reviews. A key mechanism through which the judiciary engages in policy making is the judicial review, which is defined as "the authority to hold legislative statutes and executive branch decisions and actions unconstitutional" (Kagan 2004, p. 21). Courts do not just deliver verdicts in a guilty-not guilty fashion, but also make policy recommendations in their rulings. They have often imposed obligations on the government to act in certain ways, thus defining public policy. In the 1954 *Brown* vs. *Board of Education* case on school desegregation, the court ordered an end to this form of discrimination, opening a floodgate of litigations, which further refined public policy. These include the need for school busing to facilitate racial balance in previously segregated schools. More such judicial policy-making followed in 1963 when the Supreme Court outlawed prayers in public schools and later delegitimized abortion (Kagan 2004). The final type of policies under this taxonomy, which is the focus of this article, is *override policies,* enacted through legislative veto override.

To put this public policy classification into perspective, it is noteworthy that the goal of classifying policies is to be able to compare them, observe and account for noted patterns or variations. A major reason for comparing policies is to determine how differences between them affect their implementation as well their outcomes. That is, to determine and rationalize whether certain types of policies easily lend themselves to successful implementation than others, and the conditions under which each policy type is likely to yield desired outcomes. Part of the objective of this article, therefore, is to provoke a debate on whether policies are analytically more useful when classified by objectives or when classified by how they are enacted. Fortunately, this debate may be preempted by the fact that the two policy typologies are not incongruous. For instance, policies classified by Lowi as regulatory can be further re-classified as *override*, *consensual*, *executive*, or *judicial*. It is therefore possible to think of regulatory-override public policies, for example, or regulatory-consensual public policies, and to even compare them so as to yield a richer comparative policy analysis result.

## Features of Override Policies

Override policies warrant special status as special type of public policies because they are distinct from other types of polices. Some of their distinctive features are outlined below.

### Override Policies Are Generally Very Rare

There is overwhelming evidence that override policies are rare. From 1789–2000 (209 years), only 98 or 7% of the 1400 regular vetoes were overridden by the US Congress. Similarly, between 1933 and 1991 (58 years), only 6.5% of the 784 regular vetoes were overridden (Rieselbach 1995). The first override policy in the USA was enacted in 1845 during the tenure of John Tyler, the tenth president of the USA. It prohibited president from sanctioning building of Revenue Marine Service or Coast Guards without approved appropriation from Congress. As vice-president, Tyler replaced President William Harrison who died barely a month into office in 1841. This accidental rise to the presidency raised questions about the legitimacy of his authority and earned him the unenviable nickname of "His Accidency" instead of "His Excellency." He ran into trouble with his Whig party, was expelled after only 5 months in office, and became partyless. This made it easy for his veto to be overridden (Pisenti 2018).

Andrew Johnson, the seventeenth US President (1865–1869) holds a record of suffering 15 overrides during his tenure. He is followed by Presidents Harry Truman (1945–1953) and Gerald Ford (1974–1977), with 12 overrides each (Sollenberger 2004). It is notable also that the more the regular vetoes by a president, the higher the number of veto overrides he tends to get. Indeed, our analysis of all the vetoes and overrides enacted from 1789–2000, reveals a strong positive correlation between the number of legislations vetoed by a president and the number of veto overrides (rho $= 0.83$; $\alpha > 0.005$ & $r = 0.4$; $\alpha = 0.005$).

### Override Policies Typically Focus on Sensitive Public Issues

Overrides policies are enacted on critical policy issues like the 1988 Civil Rights Restoration Bill (Rieselbach 1995). For instance, the Freedom of Information Act Amendment of 1974 was enacted through override of President Gerald Ford's veto. It came hot on the heels of the Watergate scandal, and enjoyed widespread support within and outside Congress, especially the media who exerted pressure on Congressmen to override it. Congress felt that President Ford vetoed a bill seeking to strengthen freedom of information (National Security Achieve). Similarly, the Private Securities Litigation Reform Act of 1995 was prompted by the rise in the number of class action suits against companies in the 1990s. Reform opponents linked this rise to meritless suits filed by those who want to avoid responsibility for poor investment choices or to gain unfairly through litigations. However, critics blamed the high technology companies and the accounting industry for giving false information to entice investors and seeking undeserved immunity from meritorious securities suits. Moreover, they also viewed the reforms as potential deterrence to plaintiffs who want to file even meritorious suits. Yet, meritless suits can still be dismissed by the Courts under existing laws (Painter et al. 2002).

### Override Policies Result from Stringent Multiple Legislative Actions

Unlike the other policies which are legislated once, override policies are unique because the legislature debates and votes on them twice. The first debate and voting occurs during the normal legislation when the bill is introduced to both the House and Senate for approval. The second debate and voting occurs during the veto override. In fact, some scholars have argued that the president technically acts as the third arm of the American bicameral legislature when issuing vetoes. Thus, override policies essentially exhaust the public policy legislative cycle together with its in-built accountability mechanisms. The enactment of override policies not only affirms the doctrine of separation of powers but also restores the right balance of power between the legislature and the executive by allowing the former the last say in legislation.

Enacting override policy entails stringent legal requirements than the other policies. To begin with, while other types of policies can be enacted even outside of the legislature using such avenues as *Executive Orders*, override policies can only be enacted by the legislature. The literature depicts executive orders as "an instrument of executive power that presidents have used to control policy, establish and maintain institutions, shape agendas, manage relationships, and keep control of their political fate generally" (Mayer 2001, p. 28). From 1973 to 1997, US presidents issued about 1400 executive orders (Mayer 2001). For instance, President Clinton not only used executive orders to expand civil rights, but through *executive order* No. 13087 of 1998, enacted a policy that prohibits discrimination in employment in all federal agencies on the basis of sexual orientation (Mayer 2001, p. 35).

Moreover, in most progressive constitutions, including that of the USA, override policies require a higher threshold of two-thirds of the legislators to ensure "greater impediments to improper laws" (Spitzer 1988, p. 13). Higher override thresholds also broaden the support for policy legislations. It is noteworthy that the two-thirds American threshold was a product of robust debates in which some delegates wanted a higher threshold of three-fourth. In contrast, *consensual* policies can be legislated even by a simple majority, while *executive* and *judicial policies* can be enacted, at least theoretically, even without the support of a single legislator.

### The Override Policy Process Is Characterized by Intense Conflict

The override policy process is political and conflict-prone. They are usually enacted under high-intensity conflict between the presidency and the legislature. This conflict usually spills over to implementation, raising concerns on whether override policies are ever implemented successfully. The literature recognizes that when there is very intense conflict during policy formulation, then "the implementation process presents opportunities to refight battles lost in the policy

formulation stage [whereby] those defeated in the formulation stage may have an opportunity either to minimize losses or to totally defeat their opponents' objectives by undermining or eroding implementation" (Richardson 2015, p. 337). Hence, a president who loses supremacy battle over policy agenda through an override is more likely to sabotage than to facilitate its implementation. If this is true, then enacting override policies seems to be an act in futility! Policy formulation continues during implementation partly due to vague policy statements which implementers have to clarify before or during implementation, thus giving overridden president a chance to sabotage a policy. There is also the issue of the longevity of override polices from enactment to amendment or termination. If overridden presidents often sabotage rather than support override polices, then such policies cannot have a long life-span.

### Override Policies Often Reflect Public Opinion Climate

Empirical studies have shown that public support is critical both for the presidential veto and congressional override (Spitzer 1988). Presidents who fail to read public mood often suffer override even when their party controls more than two-thirds of both Houses of Congress. For instance, even after losing significant support due to stagflation, President Gerald Ford continued to regularly veto Congressional bills, which were overridden with equal regularity. Similarly, anti-apartheid activists demonstrated against the US government's "constructive engagement" policy towards South Africa in 1985. This bred anti-apartheid public opinion which emboldened Congress to override President Reagan's veto on the sanctions to South Africa in 1986. The override was widely applauded because of the feeling that Reagan's veto had shown that he had lost touch with public opinion (Wittcopf et al. 2008).

Relatedly, the Cable TV Consumer Protection and Competition Act of 1992, enacted through President George H.W. Bush's only veto override, was stimulated by the Cable TV's monopoly status characterized by overpricing and poor services. President Barrack Obama also suffered his only override in 2006, when Congress voted to override his veto on the Justice against Terrorism Act. The override is largely attributable to the September 11 victims who mobilized public opinion in favor of the bill. Not only did they organize demonstrations and pressurized Congressmen to pass the original bill, but after its passage, they staged sit-ins outside White House to implore President Obama not to veto it. When the president vetoed the bill, they exerted even more pressure on Congressmen to override it (Miller 2019, p. 52).

## Conclusion

This article sets forth override policies as distinct, rare, and neglected type of public policies, enacted through legislative override of presidential vetoes. It has situated override policies within a new policy classification scheme that is based on how a policy is enacted as opposed to Lowi's classification based on a policy's intended outcomes. While the elaboration of this new policy typology is outside the scope of this article, an overview of the typology has been provided. Essentially, the typology classifies public policies into four categories – *consensual*, *executive*, *judicial*, and *override policies*. The article also highlights some of the distinctive features of override policies which justify its treatment as distinct type of public policy. In a nutshell, override policies are very rare; exclusively focus on very sensitive and controversial public issues; tend to mirror the existing public opinion climate; are products of stringent multiple legislative actions; and are enacted under high intensity conflict.

[2]Department of Industrial Design, IdA, University of Brasília, Brasília, Brazil

## Overview of New Knowledge in Public Sector Enterprise Architecture from 2013 to 2018

### Synonyms

Bibliometrics analysis of enterprise architecture; Enterprise architecture in the public sector; Literature review of enterprise architecture

## Definition

A bibliometric analysis of articles related to enterprise architecture in the public sector that tries to comprehend the overview of studies and definitions and help to guide researches.

This essay presents an extended literature review of the main articles on a worldwide scale that focus on enterprise architecture in public administration. The method used bibliometric indicators to show existing correlations in data from 82 articles cited in the world's most impactful journals between 2013 and 2018. This approach identified new contributions primarily in the areas of technology, science, and government programs. The analysis of indicators showed that research in enterprise architecture in the public sector correlated with e-government strategies and interoperability, demonstrating that these approaches are currently in favor as the leading approaches to achieve goals and solve problems in the field. The findings of publication places in journals and events represent a contribution to researchers and professionals in this area who are interested in submitting articles for publication or even to consult and read articles of EA subject. This essay also found that enterprise architecture initiatives are growing in the East, while decreasing in the West, which is an important dynamic for EA researchers, practitioners, and organizations to understand.

## Introduction

Public agencies have been supporting technology infrastructures that increasingly focus on delivering services and conducting the business of government. The use of these technologies supports the major efforts of reorganization, modernization, and reinvention of government using e-government as a possible solution together with promoting organizational change (Dang and Pekkola 2017). Such e-government initiatives have been credited as engines of efficient public administration reform, and given their progression state, they can be classified based on their implementation and governance levels.

Although there is no common definition for enterprise architecture (EA) concept in the literature, many definitions agree that EA concerns the organizing logic articulating business processes,

the information used and produced by these processes, and the corresponding information technology (IT) architecture. To ensure that these four components are aligned from business to IT needs, governance standards and practices are requested, as well as the development of governance levels.

Despite the importance of e-government and EA, there are few studies on e-government impacts on public agencies' performance, and there is a lack of empirical evidence of the various performance effects of e-government. Many studies on e-government are based mostly on speculative reasoning rather than empirical analysis with rigorous methodologies.

This chapter presents an exploratory research which uses literature review through bibliometric and contextual analysis to study EA within the public administration and its evolving changes in the last 6 years. It is an extension of a previous study by Ramos, Souza, and Rosa (2019b).

## Enterprise Architecture in Companies

### Enterprise Architecture

John A. Zachman created the expression "enterprise architecture" (EA) in the 1980s. According to Zachman (1987), enterprise architecture is a set of descriptive representations that define organizations; these descriptions reveal the aspects necessary for effective management and requirements to maintain current levels of performance.

Bellman and Griesi (2015) present a definition of EA as the organizing logic of the business process and informational technology (IT) infrastructure, reflecting the requirements of integration and standardization within companies' operating models. The intention of EA is to define how an organization can more effectively achieve current and future goals.

In order to show a summarized definition, Bakar and Selamat (2016) argue that EA is a hierarchical way of describing how information systems, business processes, and people in an organization function as a whole. EA demonstrates the crucial importance of a framework that reveals connections within an organization.

According to Lapalme et al. (2015), EA fundamentally focuses on identifying shared assets and on the relationship of all different elements across a given enterprise. In view of this, it is important in EA to make the project planning process explicit during the construction of the architecture, seeking input from the very conception of the framework to be used that will attend to the multiple interests and expectations.

### EA Frameworks

The framework that is so central to all enterprise architecture was given its most comprehensive overview by Zachman (1987), who introduced EA as the logical structuring and classification of those descriptive representations of a company that are significant to management and corporate development functions.

According to Marosin (2013), enterprise architecture is an embracing framework used to manage and align an organization. He describes the strategic direction of all components of a company: its organizational structure, its business processes, its employees, its other stakeholders, its applications, its data, its infrastructure – to name a few. An architecture framework is a conceptual structure to analyze an enterprise and to structure both architecture and its design process. Such a framework often takes the shape of a two-dimensional matrix.

Therefore, it is possible to observe that among the definitions of enterprise architecture, there are those that aim to better define the theoretical aspect of the construct of EA, and there are others that seek to define the construct in its operative aspects, such as those that are concerned with EA frameworks and applications as they pertain to the ongoing operations of existing organizations.

### Recent Applications of EA in the Public Sector

Nowadays, Bellman and Griesi (2015) present a definition of EA as the organizing logic of organizations' business processes and IT infrastructures, reflecting the requirements of integration and standardization of the companies' operating models.

One of EA's most popular applications is its use as a methodology to improve the

interoperability and efficiency of inter- and intraorganizational IT systems (Lemmetti and Pekkola 2014). These initiatives are usually voluntarily undertaken, although sometimes the process is mandated by law, as in the United States's 2002 "E-Government Act" and Finland's 2011 "Act on Information Management Governance in Public Administration."

Governments normally consist of many agencies with different structures and service/business areas that typically lead to duplicated information systems and fragmented business services and processes, decreasing the possibility of cross-agency interoperability. Therefore, governments pursue EA initiatives in its various agencies to increase online services and to provide new tools to manage a business and align IT infrastructures within agencies in order to better integrate the use of technology, to improve data structures and applications, and to provide increased business modularity (Dang and Pekkola 2016).

### Literature Review in EA

Kotusev (2017) observed that EA literature reviews have been primarily concerned with aspects of professional articles such as their distribution over time, the research groups and communities that generate them, citation and authorship patterns, publication types and geographical distribution, reference discipline, theory types, and empirical validity. Those using bibliometric indicators employ a set of mathematical and statistical methods to analyze indicators of scientific quality, scientific activity, and scientific impact.

Literature reviews that map publications over distribution over time revealed that the decade ending 2000 and decade beginning 2010 were the apex of publications in government or public sector EA studies (Ramos and de Sousa Júnior 2015; Dang and Pekkola 2017; Lnenicka and Komarkova 2019).

Ramos and de Sousa Júnior (2015) analyzed the literature published in the period from 1999 to 2014, showing that the main EA focus in the public sector was in e-government, service, government, and interoperability. Dang and Pekkola (2017) argued that researches focus on development issues and frameworks, and little was known about how those frameworks and practices were actually used and followed, how well they fit with their purposes, and what are the stakeholders' reactions were. Lnenicka and Komarkova (2019) showed that big data, open data, cloud computing, and EA framework were prevailing themes in scientific articles pertaining to government EA.

Most literature reviews use similar databases: the AIS Electronic Library, the ACM Digital Library, EBSCO, Google Scholar, IEEE Xplore, JSTOR, Science Direct, Springer Link, Taylor & Francis, and Web of Science. The use of these databases is justified, as they ensure the inclusion of scientific articles from the highest impact full-text journals and conference proceedings (Rouhani et al. 2015; Dang and Pekkola 2017; Gampfer et al. 2018; Lnenicka and Komarkova 2019). However, authors have not previously made a review using such bibliometric indicators, as SCImago Journal Rank (SJR or ScimagoJR), H-Scopus, or Journal Impact Factor (JIF), and because they lack this information in their inclusion criteria, they often include in their review articles that are indexed but that have low academic relevance and impact.

## Methodology

This research is a systematic literature review (SLR) characterized as descriptive, which intends to comprehend the theme in a broader way, through the following steps:

- Step 1: Define topics and research questions.
- Step 2: Define the database and criteria for the articles, from the consultation of two databases that enabled the survey of journals and scientific events.
- Step 3: Identify and select those studies, based on the analysis of keywords in titles and abstracts in the database, considering inclusion and exclusion criteria.
- Step 4: Read each article to identify and categorize themes that might make viable research variables.

- Step 5: Data consolidation: quantitatively analyze all publications sampled using descriptive statistics and qualitative analysis with the use of content analysis (for relevant journals and scientific events in the sample of publications).

Table 1 shows the research guidelines.

The definition of the temporal clipping established was to align the parameters with those of Ramos and de Sousa Júnior's (2015) publication that presented a bibliometric research of enterprise architecture in the public sector.

The option to search for publications of scientific events was made because of the shortened lag time between the completion of the study to its publication in international journals. Scientific events usually take less than a year to be published, whereas it is customary for academic articles to take 2 years or more to appear.

The inclusion criteria restricted the article searches in the databases considering the research context (public administration) and limits the time period to the last 6 years for content analysis, which allows an overview of the evolution of any given theme of inquiry.

The Publish or Perish software was used to search for academic publications and the Portal of Periodical Publications of the Coordination of Superior Level Staff Improvement (CAPES) of Brazil allowed the identification of periodicals evaluated by peer review.

In data consolidation, quantitative analysis was made of the 82 articles collected from the

database. The analysis revealed 28 articles that met criteria as highly impactful after factoring in the Qualis CAPES stratum, the SCImago Journal Rank (SJR), and the H-Scopus for periodicals. The SJR shows the visibility of journals from developed countries contained in the Scopus® database. The H-Scopus aims to quantify the productivity and impact of research by means of the following measures: number of publications per periodical ("$h^1$") and number of citations of each article ("$h^2$"). A qualitative analysis was used to identify the major themes that were present across the most impactful 28 articles.

## The Last 6 Years of EA Research in Public Sector

From the quantitative analysis, it was noticed that most articles, 71.95% (59 papers), were published as scientific events. None of these papers were later published in a journal. This low recurrence of subsequent publication of event articles in journals increases the need to investigate publications in order to gain more comprehensive knowledge of research publications on the subject.

The scientific production on EA in journals was stable in the period of 2014 to 2016, with six articles per year. However, in terms of publications in scientific events, there was a noticeable growth in 2014, followed by a drop in 2015, and another remarkable growth in 2016 and 2017, as shown in Table 2. As the survey was conducted until August 2018, that year cannot be considered as a full year for analysis, in order to indicate that there was a decrease in production on the subject (Fig. 1).

Analyzing the time distribution, the same graphic verified by Lnenicka and Komarkova (2019) is shown in his analysis from 2003 to 2018. Comparing these results with the time distribution performed by Gampfer et al. (2018), with an analysis period from 1987 to 2016, and the object of analysis has been EA, the pattern repeats, except for the fall of publications in 2015.

The 24 articles were published in 21 different journals. Journals with recurrence in publications are *Sustainability*, *Software and Systems Modelling*, and *Enfoque*, each with two articles. Only *Enfoque* did not meet H-Scopus and SJR criteria on ScimagoJR. From the 21 journals, 19 meet H-Scopus, SJR, and Qualis CAPES criteria in that the evaluation for inclusion is made through peer review.

Table 3 shows which journals in SJR score greater than 0.401. This cut from the 0.401 index shows that the journal has a higher stratum in Qualis CAPES. Furthermore, for this sample, the SJR index average is 0.53, the median value is 0.48, and the standard deviation is 0.39.

The average for H-Scopus is 40.64; the median value is 40. The maximum value of the SJR obtained was 1.32 from *Government Information Quarterly*. Based on this analysis, nine journals stood apart from the rest as especially relevant and impactful.

It is worth noting that the journal with a maximum value of H-Scopus was 101 by IEEE Internet Computing but it has an SJR of 0.38.

Of the 59 articles of scientific events, 47 scientific events were identified, wherein International Conference on Enterprise Information Systems

(ICEIS) and Pacific Asia Conference on Information Systems (PACIS) have the highest concentration of articles (4 papers each).

These findings of publication places in journals and events represent a contribution to researchers and professionals in this area who are interested in submitting articles for publication or even to consult and read articles of EA subject.

Considering the articles of journals and scientific events indexed on ScimagoJR (a total of 32 articles), the subject area concentration is computer science, with 75% of papers, others (25%) are distributed in these areas: engineering, social sciences, mathematics, environmental science, energy, medicine, decision sciences, materials science, agricultural and biological sciences, chemical engineering, biochemistry, business, management and accounting, and genetics and molecular biology.

A total of 82 articles were written, and 139 authors participated in the research. Most prevalent were co-authored articles (30). A total of 11 were single-author articles. The average number of authors per research article was 2.74. The number of citations of these articles is an important indicator for verification of the author's relevance. The author R. Abraham's article "Enterprise architecture artifacts as boundary objects - A framework of properties" published in *Proceedings of 21st European Conference on Information Systems* (ECIS 2013) was cited 45 times.

The mean number of citations for the 82 papers in the sample was 4.5122, the median value is 1, and the standard deviation is 8.71.

Regarding the author's institutional linking, 70 universities were identified. The University of Technology of Malaysia has the largest number of published articles (six papers). Then there are the universities where each one published three articles: University of Zagreb (Croatia); University of Brasília (Brazil); Bandung Institute of Technology (Indonesia); and Islamic Azad University (Iran). Finally, the universities where each published two articles are the University of Rostock (Germany); Bina Nusantara University (Indonesia); IBISTM (Croatia); University of Tehran (Iran); University of Lampung (Indonesia); American University of Sharjah (Emirates); Federal University of Rio de Janeiro (Brazil); Ryerson University (Canada); Telkom University (Indonesia); Royal Institute of Technology (Sweden); and Tampere University of Technology (Finland). This information is important for researchers who are interested in establishing partnerships in the study of AE.

Seven articles provided no information or were missing information about the author's affiliations.

Indonesia is the country whose authors generate the largest amount of research (12 papers), followed by authors from Malaysia (7 papers), Germany (6), Iran (6), the United States of America (5), France (5), Switzerland (4), Finland (4), Brazil (4), and Croatia (4). In terms of continents, Europe predominates with 14 contributions, followed by then Asia with 8. Latin America, and the Middle East, contributed 4, North America 3, and Africa and Oceania 1. These data highlight robust activity in EA in the far East, as shown by the Waseda University International e-Government Ranking, published in 2018. The state of Singapore, South Korea, Japan, and Taiwan rank second, sixth, seventh, and ninth in the implementation of e-government, respectively (Toshio 2018). This ranking is based on ten assessment indicators, one of which is "management optimization" that includes the sub-indicator "integrated enterprise architecture." In general, Singapore was a world leader in making efforts to integrate internal government network architecture, earning the nation a second-place ranking on the "management optimization" indicator. The Malaysian government also employed an enterprise architecture framework to create an active strategic alignment between backend business and ICT usage in government organizations. South Korea implemented several initiatives and programs for optimizing the business process of public sectors such as government-wide enterprise architecture (GEA). The South Korean government also notably reached a high level of efficiency and transparency of their programs' administrative processes. According to Hussein et al. (2017), successful EA establishment in the Malaysian public sector has provided effective and efficient service delivery in the public sector.

From the published articles, eight surveys had participants from, at least, one public organization. The public organizations are the Ministry of Communication and IT from Riyadh in Saudi Arabia; Ministry of ICT from Bogota in Colombia; Government of Ontario from Toronto in Canada; Integration and Interoperability Coordination (SERPRO) from Brasilia in Brazil; New York City Transit (NYCT) from New York in the United States; and IT Organization of Iran from Tehran in Iran.

The main keywords from the researched articles are enterprise architecture (47 papers); enterprise architecture framework (13 papers); public sector (7 papers); TOGAF (6 papers); e-government (5 papers); framework (5 papers); balanced scorecard (4 papers); Zachman framework (4 papers); change management (3 papers); software architecture (3 papers); and metrics (3 papers).

There is no consensus among authors about the use of keywords for indexing articles.

The results of keyword searches are in line with the Lnenicka and Komarkova (2019) analyses of the terms enterprise "architecture framework," "TOGAF," and "Zachman framework," but returned no results for the terms "big data" or "cloud computing." The framework is the basis of EA; according to Sousa, Marosin, Gaaloul, and Mayer (2013), EA is a framework used to manage and align an organization that describes the strategic direction of all company's components:

organizational structure, business processes, people and stakeholders, applications, data, infrastructure, etc (Fig. 2).

In the public sector, EA has become a tool to support e-government and interoperability activities. So, EA research must be closely associated with disruptive technologies, such as big data, cloud, artificial intelligence (AI), and Internet of things (IoT) that are an essential part of e-government or digital government (Toshio 2018).

This review's enhanced methodology for determining the relative impact of publications further limited our original 82 journals to those 28 articles published in periodicals and scientific events of greater relevance.

Initial analyses have shown that most of the published articles (18 papers) are empirical, which refers to reports of specific experiences of public organizations. Of the nine theoretical articles identified, all are bibliometric surveys.

**Overview of Scientific Production in Public Sector's Enterprise Architecture from 2013 to 2018, Fig. 2** Bibliometric map of keywords

O

There is no predominance in research design, in which 36% (10 papers) are descriptive, 32% (9 papers) are exploratory, and 29% (8 papers) are explanatory research and have a qualitative approach.

Regarding the origin of the data, 50% of the publications (14 papers) used primary sources in the collection, in which data were collected in field surveys. Secondary sources were used in 29% of the publications (8 papers), essentially based on bibliographic analysis research. There were six papers that had secondary and primary data. On the data collection strategies, the greatest recurrence is of case studies (12 papers), followed by bibliographical research (6 papers). In addition, the following research strategies were also identified: opinion survey (two papers), documentary research (two papers), and experimental research (one paper).

Bibliographic research, survey, observation, documentary analysis, interview, documentary research, the Delphi method, focus groups, and experimental tests are among the instruments of data collection most used by the authors.

The relative majority of empirical studies (seven papers) were carried out at a federal level, though four studies were conducted at universities (four papers). Two studies in the health sector were identified as well. It is worth stressing that the EA theme is an interdisciplinary matter and is part of many countries' governance agenda. Thus, articles that analyze the EA of international governments were present.

Among the analyzed articles, it was possible to classify different types of difficulties related to EA, which were grouped in six thematic categories: deficiency of the EA model(s) to meet current organizational needs; deficiencies in the planning and implementation of EA; difficulty of integration; conceptual difficulties; technical and nontechnical difficulties; and lack of agility in meeting demands. These results are in line with Ramos, França, Oliveira, and Montezano's research (2019a) that points out the weaknesses of EA, such as the understanding of concepts as limitations of public organizations in the adoption of EA.

In the same way, it was identified in the literature possible benefits obtained or expected by public organizations in relation to the adoption of EA. In this case, it was possible to classify benefits in nine thematic categories: achievement of organizational objectives; organizational alignment (from IT to business); advance of e-government; contribution to organizational change; organizational communication; organizational knowledge management; improves organizational (and IT) management; improves organizational (and IT) performance; and promotes the integration of organizational components. These results focus on implementation in public sector organizations, showing the practical capability of EA.

## Conclusion

The study analyzed the evolution of the EA theme in the public sector. It is important to note that articles of EA focus on the areas of computer science, engineering, and social sciences, which shows a multidisciplinary character involving different aspects in the public sector. The analysis shows that considered scientific events and articles published in proceedings can be significant for comprehending the theme since research shows that much of the EA literature appear on scientific events.

Through the bibliometric analysis, we can observe growth in the approach of the theme in worldwide scope, in addition to a change of stakeholders' region, which are no longer concentrated in the West but instead are surging in the East. The countries with the highest volume of publications in the sample used were Indonesia, Malaysia, Germany, and Iran. The United States trails them in contributions.

In conclusion, we find that, after three decades of research, publications, and development of EA in the Western nations, countries in the East appear to be the most recent adopters of EA approaches. This could be caused by political issues. In the United States, data disappeared throughout the US federal government in the Trump administration, apparently motivated by commercial interference under the public administration (Lewis 2018). The search for government transparency as a reflection of democratic transformations and more politically involved societies

may make EA a sensible and evidence-based solution. Malaysia is a good example of a country that is passing through a democratic transition, and it would appear that a direct relationship exists between the development of EA in the country and its new democratic policies, though further research in this area may yield more insight into the connections between the political changes of Eastern countries and their newfound adoption of EA.

## Pakistan's Urgent Need for Clean Air

A. Naila Saleh[1] and B. Saima Saleh[2]
[1]Department of Public Policy, Pakistan Institute of Development Economics, Islamabad, Pakistan
[2]Health Wing, Capital and Development Division (CADD), Islamabad, Pakistan

### Synonyms

Ambient Air Quality; Air Quality Management; Air Pollution

### Definitions

Air pollution refers to the presence of toxic chemicals or pollutants in air which deteriorates the quality of air and pose risk to health. The higher the level of these polltants, the more damaging are the impacts on health. These pollutants can either be in gaseous form or can occur in solid form such as particulate matter.

### Introduction

Air pollution is one of the most pressing environmental concerns globally. The worsening air quality in Pakistan poses a grave threat to the city dwellers and is a major environmental problem in the country. Pakistan takes three slots among the world's top ten most polluted cities (Fig. 1) (WHO, Ambient Air Pollution Data 2014). Furthermore, it was ranked 148 among total of 178 countries by the Environmental Performance Index (2014) in terms of human health from environmental damage. Concentrations of toxic pollutants in air are way above the safety thresholds in big cities. The rising air pollution has left millions to breathe unhealthy air. More than 22,600 deaths and 5 million childhood illnesses annually are attributed directly or indirectly to air pollution in the country (Martin et al. 2006; World Bank 2008).

High concentration of pollutants in environment damage both health and environment. It exacts huge cost on economy in terms of life losses, expenditures on health, and reduced activity due to sickness. Pakistan's economy bears an annual loss of 62–65 billion PKR due to air pollution (Martin et al. 2006). The low-income groups and children are among the worst affected from this deteriorating air quality.

Healthy ecological environment is a fundamental human right and need. Right to clean air is recognized by the constitution of Pakistan and enjoys legal protection. But this right looks good only on paper and has no practical application in the country. Ambient air quality in Pakistan lags far behind the national and international standards. Environment is taken extremely for granted in the region due to lack of effective accountability of polluters. The rapid urbanization

**Pakistan's Urgent Need for Clean Air, Fig. 1** Ten cities worldwide with highest levels of air pollution (Source: WHO's Ambient air pollution database 2014)

**Pakistan's Urgent Need for Clean Air, Fig. 2** Concentrations of $PM_{10}$ (μg/$m_3$) in South Asian countries, 2008 (Source: World Bank 2010)

accompanied by absence of emission control strategies in the country has deteriorated air quality to alarming levels. This entry analyses the severity of air pollution in Pakistan and highlights the inadequacies and loopholes in existing regulatory framework aimed at monitoring and regulating air quality in the country. With the undergoing structural transformation of Pakistan's economy, urban population is projected to increase to 63.7% by 2050 (UN 2007). In the given scenario, there is a strong need for regulating the air quality.

## An Overview of Air Pollution in Pakistan

In this rapid developing world, one of the biggest threat to human health is posed by air pollution. The significant surge in hazardous emissions due to the increase in industrial activity, number of automobiles, fossil fuel combustion for energy generation and waste burning, has severely compromised the quality of air. The concentration of air pollutants in most regions of South Asia exceeds WHO guidelines (HEI International Scientific Oversight Committee 2010). The ambient air quality in Pakistan is particularly alarming as the level of PM are much higher compared to the neighboring countries (World Bank 2008; WHO 2006). Exposure to PM results in most severe health damages.

The graph above shows concentration of $PM_{10}$ in many South Asian countries. The concentrations found in Pakistan are significantly higher compared with the other countries. $PM_{10}$ is one of the most damaging air pollutant given its severe impacts on health (Fig. 2).

Figure 1 shows the list of top 10 most polluted cities globally as per WHO's Air pollution database. Three cities of Pakistan namely Karachi, Peshawar, and Rawalpindi are among these ten cities (Fig. 1).

Table 1 shows time series analysis of major pollutants from 2007–10 in major cities of Pakistan (Table 1). The concentration of $PM_{2.5}$ exceeds significantly the safety threshold in all cities. Lahore has the highest $SO_2$ concentrations followed by Quetta and Peshawar. However,

**Pakistan's Urgent Need for Clean Air, Table 1** Average values of $PM_{2.5}$, $SO_2$, $NO_2$, $O_3$, and CO for five different cities

| | $PM_{2.5}$ (μg/m$_3$) | $SO_2$ (μg/m$_3$) | $NO_2$ (μg/m$_3$) | $O_3$ (μg/m$_3$) | CO (mg/m$_3$) |
|---|---|---|---|---|---|
| Islamabad | 61 ± 31 | 6 ± 3 | 49 ± 28 | 47 ± 29 | 1.4 ± 1 |
| Quetta | 49 ± 26 | 54 ± 26 | 37 ± 15 | 40 ± 13 | 1.1 ± 1 |
| Karachi | 68 ± 38 | 34 ± 34 | 46 ± 15 | 27 ± 13 | 0.6 ± 1 |
| Peshawar | 71 ± 38 | 39 ± 34 | 52 ± 21 | 35 ± 19 | 1.5 ± 1 |
| Lahore | 143 ± 69 | 71 ± 48 | 49 ± 25 | 42 ± 22 | 1.3 ± 1 |

Source: World Bank publication 2014

**Pakistan's Urgent Need for Clean Air, Fig. 3** Comparison of concentration levels (daily average) of suspended $PM_{2.5}$ in Pakistan μg/m$_3$ with WHO and NEQS standards (Source: Ghauri 2010: Data collected from fixed stations installed by JICA)

concentrations of $O_3$ and CO are within national and international standards.

Figure 3 shows the standards set for $PM_{2.5}$ concentrations by WHO and NEQS and compares it with the actual concentrations in the five major cities of the country (Fig. 3). In all the five cities, its concentration exceeds the national as well as international standards. The levels of $PM_{2.5}$ are alarmingly high in Quetta, Peshawar, and Lahore. Even in Islamabad and Karachi, these concentrations exceed the WHO standard guidelines.

Exposure to PM results in most severe economic and health damages (WHO 2006). The concentration of $PM_{10}$ in urban areas exceed 200 μg/m$_3$ (Ghauri et al. 2007). More than two-third of PM are attributed to the transport and energy sector. Half of the hydrocarbon as well as $NO_x$ emissions are attributed to the same sector (Ghauri 2010). Industry is another major sector responsible for the rising air pollution in Pakistan.

The poor air quality has made the living conditions in urban cities, least attractive globally. For instance, Karachi was ranked 135 among a total of 140 cities in the Liveability Index by Economic Intelligence Unit (Economic Intelligence Unit 2010). As per World Bank study, 22,600 deaths annually are directly or indirectly caused by air pollution in Pakistan. Out of these, more than 800 are children below 5 years of age (World Bank 2008). Outdoor air pollution is also responsible for more than 80,000 hospital admissions of children under 5 alone, annually. 5 million lower respiratory cases and 8000 cases of chronic bronchitis among the same age group, is also attributed to outdoor air pollution (WHO 2011). The annual mean cost of outdoor air pollution in Punjab is estimated at 9–13 billion PKR. Seventeen percent of this cost is associated with morbidity and 83% with mortality (Asia 2014).

## Pakistan and the Barriers to Enforcing Clean Air Standards

Poor environmental governance in Pakistan is a primary cause of rising urban air pollution. Right to clean air and environment is enshrined in the constitution of Pakistan. According to Supreme Court Justice Mansoor Ali Shah, "the right to healthy air is within the right to life and dignity under our Constitution." A legislative framework also exists for regulating air pollution. However, it is followed by little implementation measures.

No specific organization in Pakistan is responsible for the management of air quality. Theoretically speaking, Air Quality Management System

in the country could be traced back to 1983 when National Environment Quality Standards (NEQS) were introduced for protection of ambient air quality and were developed in 1993 (revised in 2009). As per these standards, limits were imposed on industrial and automobile emissions. Pakistan Environmental Protection Act (PEPA) 1997 provided a proper framework for regulating environment including air pollution. This act was the cornerstone of legislation on environment. The responsibility for regulating environment under the act was delineated to the central and provincial Environmental Protection Agencies (EPA). Pollution charge rules were drafted in 2001 making polluters accountable for paying the principal the damage to the environment. Nevertheless, due to strong influence from effected powerful groups, these rules were never implemented (Khan 2011).

In 2002, a full-fledged Ministry of Environment was established. The ministry was mandated to design and implement the environmental policies. But the MOE was absorbed by Ministry of Climate Change (MOCC) as the subject of environment was devolved to provinces after the 18th amendment. The Ministry of Climate Change (MOCC) was established in 2012 which was later downgraded to a division, to address the subject of climate change. The Pak EPA responsible for implementing PEPA is now dependent on the Climate Change Division (CCD).

In the post 18th amendment era, provincial EPA has become responsible for the management of environment within their jurisdictions and the role of the central EPA has been merely reduced to assisting the provincial governments for the regulation and implementation of PEPA. In the given scenario, the need for coordination between the national and subnational entities for managing environment has become more than ever important. No such mechanism exists currently for the intergovernmental and intersectoral coordination for the management of national air quality. But in contradiction to the current policies, regulations lag much behind.

Pakistan is one of the few countries where no proper data is collected on ambient air quality by the monitoring networks. There is serious paucity of data on quality of air. Pak EPA and provincial EPAs are in charge for collecting data on air pollution and are not collecting any data since 2014. Japanese International Cooperation Agency (JICA) which installed fix as well as mobile air monitoring stations in the country from 2006 to 2009, collected data on concentrations of key pollutants in five major cities. However, due to certain technical and budgetary constraints, adequate monitoring of the air quality was not maintained. In the absence of regular and accurate date on air quality, no systematic efforts can be made for its improvement.

For tackling air pollution, acknowledging its urgent nature is very important. Implementing air quality standards are nearly impossible without air-quality monitoring. Furthermore, absence of national coordination on air quality monitoring is another major obstacle as devolution of environment has increased these challenges. It is time for the government to start monitoring air pollution and calculate its cost and implications. Weak emission control laws which lie at the root of the problem, shall be strengthened. Reporting of data to public on the quality of the air they breathe is very important.

## Conclusion and Recommendations

Pakistan needs great strides for reducing air pollution. The barriers in the way of improving air quality are well known. Currently, there is serious paucity of data on air quality. The air pollution monitoring as well as control efforts are extremely inadequate. People are least aware about the unhealthy quality of air that they are exposed to, as well as their right to clean air.

The gravity of the problem is such that it could not be ignored or delayed anymore. The federal government needs to start nationwide programs aiming at controlling air pollution. Consistent standards shall be set nationwide. The central government in collusion with provincial governments should pass clean air act and a collective action should be made by the government, private sector, as well as public citizens for improving the ambient air quality.

### Strengthening Air Quality Management Through Proper Upgrading of Regulatory Bodies

Pakistan has in place the National Environmental Quality Standards and other legislative measures for regulating the ambient air quality. However, these measures suffer from poor enforcement. No specific department under the Pak or provincial EPA are adequately responsible for the management of Air Quality. The EPA's at centre and provinces should be upgraded and strengthened. Proper planning on part of all provinces is needed for implementing the directives on legally binding limits on air pollution.

### All Sources of Pollution Shall Be Identified and Addressed

If air pollution is to be tackled, the government will have to prioritize this problem by assigning resources for developing required infrastructure for collection and monitoring of data on air quality. Proper data shall be collected on major and minor sources of air pollution in major cities and a categorical endeavour shall be made for introducing policy frameworks and implementation measures for reducing emissions from all these sources. Emissions from multiple sources can be effectively monitored and evaluated only in the light of reliable and steady data.

### Public Litigation

As the federal and provincial governments have so far failed to build capacity for fully implementing PEPA. The direct participation of community by means of increasing resort to litigation as a tool against breaching of the limit values by polluters, will bring substantial improvements in the quality of air. In this regard, devising favorable legal systems for public will help in development of environmental claims. Separate environment protection tribunals shall be established for ease of access by public and for speedy justice.

To conclude, Pakistan's air pollution can be effectively addressed with a series of serious coordinated steps and interventions. Upgrading of institutional capacity for implementing the existing legislative measures is very important for strengthening air quality monitoring. Clear and concise mandates shall be assigned to the regulatory bodies to avoid overlapping of responsibilities. The gap on air quality data shall be plugged on priority basis. Last but most importantly, public shall be directly involved for ensuring their right to clean air.

## Synonyms

2030 United Nations (UN) Agenda; Human capital development; Policy implementation; Public policy; Sustainable development goals

## Definition

**Human capital development** The process of creating opportunities in the aspect of social and economic empowerment through training, workshops, coaching, consultation, and cultivating environments in which human beings (individuals) can rapidly learn and apply new ideas, competencies, skills, behaviors, and attitudes for task actualization and sustainability.

**Sustainable Development Goals** The launch of United Nations (UN) Sustainable Development Goals (SDGs) with 17 Goals by world leaders on September 25, 2015, opened up both governmental and commercial nongovernmental actions on the approaches that will produce solution to the problems of poverty, food security, inequality and injustice, and tackle climate change by 2030. This is contained in a document "Transforming our World: the 2030 Agenda for Sustainable Development." Each government will also decide how these aspirational and global targets should be incorporated into national planning processes, policies, and strategies. It is important to recognize the link between sustainable development and other relevant ongoing processes in the economic, social, and environmental fields (UN General Assembly 2015, p. 13).

**Policy Implementation** It involves a general political and technical process of enforcing government intentions, decisions, and programs to address societal pressing demands or needs (Ayisi et al. 2018).

## Introduction

There is a desperate need for a sound human capital intervention (SHCI) policy reform in Nigeria if the country is to achieve the targets set in the 2030 Agenda. World over, HCD remains a central element in the development of any individual, nation, state, or institution. Thus, effective implementations of practical Human Capital Intervention Policies (HCIPs) and programs are the necessary foundations and platform for Sustainable Development Goals (SDGs) (Dialoke et al. 2017; Jooji and Oguchi 2017) and poverty reduction since poverty manifests through lack of basic needs (Dzanku 2019). Public policy implementation (PPI) involves "a general political and technical process of enforcing government intentions, decisions, and programs to address societal pressing demands or needs" (Ayisi et al. 2018).

No doubt career bureaucrats are responsible for coordinating, monitoring, and enforcing implementation activities (Jooji and Oguchi 2017; Ukeje et al. 2020c) of public policies in the various ministries and or/agencies of the government; but they cannot deliver all the SDGs strategies effectively without involving local public stakeholders, acting in collaborative partnership to implement the goals.

Thus, the capabilities of government bureaucracy in terms of expertise, skill orientation, and experience determine to a large extent the success or failure of policy implementation (Osawe 2015; Ighodalo 2018), including human capital food security program (HCFSP). However, studies have shown that public policy reform and intervention in Nigeria have witnessed a declining performance in spite of several efforts geared toward transforming the system to reposition the country's bureaucracy for an improved citizens' welfare (Offu et al. 2018; Ukeje et al. 2019). The reality of Nigerian bureaucracy is dominant politicization and unavowed institutionalized corruption. There are extant rules and established bureaucratic procedures, but they simply exist in nominal plane: they can easily be breached with impunity by both politicians and top bureaucrats (Ukeje et al. 2019) due to lack of sound-administrative system and or governance in the country. Importantly, sound political process and effective institutions require committed political leadership, clear direction, and appropriate strategic influence and the very fact that none of these will happen without a robust governance structure (Momen and Begum 2020).

Developing human capitals (HCs) requires creating opportunities in the aspect of social and economic empowerment through training, workshops, coaching, consultation, and cultivating environments in which human beings (individuals) can rapidly learn and apply new ideas, competencies, skills, behaviors, and attitudes for task actualization and sustainability (Ozoya 2016). These have serious implications for the realization of good and sound governance objectives. Generally, the success or failure of any meaningful HCIPs is a function of its human capital, governance, strategies, and implementation and the impact it has on the citizens who are the Real Policy-Target Beneficiaries (RPTBs). However, current literature in the field of policy studies, governance, and development administration (Ayisi et al. 2018; Olavarria-Gambi 2018) have explored the dynamics in policy implementation processes and examined some reasons policies fail or succeed – or are claimed to have failed and link policy failure or the perception of failure (Grace et al. 2017) to variations in learning (Zhang 2017) whereby knowledge, policies, or administrative arrangements shift from one nation or policy domain to another, intent and outcome (O'Toole 2004) for a better understanding of the game in PPI and that certain policies fail (McConnell 2015; Ayisi et al. 2018) when the outcome deviates from the intention (Agyepong and Adjei 2007). Policy analysis and implementation is a multidisciplinary and systematic investigation aimed at gathering and analyzing information about likely consequences of public policies both before and after they occur (Ezeani 2006) and the activities that are carried out in light of established policies in order to ensure that programs are meeting their intent (Atkinson 2017).

Importantly, Howlett and Ramesh (2003) stressed the need for a comprehensive knowledge by policy drivers in a systematic and controlled manner for the attainment of policy goals and objectives (Parsons 1995). However, a policy is successful when implementation bears relationship to the intentions of policy adopters (Olavarria-Gambi 2018). This can only be achieved through citizen participation as an element of sound governance (Farazmand 2012, 2017) giving them the opportunity to take part in decision-making that addresses their concerns (Ricciardelli 2018). Sound governance also implies sound policy in administrative, managerial, and organizational processes that are participatory and engaging rather than elitist and corporatist in character (Farazmand 2017).

Sound governance-driven HCIPs often build on the people's expressed will, wider participation, and justice. Adopting a sustainable food system agenda requires multiple stakeholders for sustainability (Bene et al. 2019). Fischer-Smith (2018) contends that policy implementation

loses its effectiveness when those charged with the responsibility of implementation act in the manner opposed to the policymakers' specified intentions, which often includes divergence between the policy design and implementation processes. This entry raises questions about the missing link in the formulation of human capital intervention (HCI) policy programs, design, implementation, outcome, and more importantly, sustainability especially in this era of SDGs that has challenged the capacity of public service and service delivery especially in developing nations.

It is noted that policy failure, success, and/or performance in Nigeria public sector organizations is predicated on the ideology of the policy-drivers due to the forces of state-elite capture, corruption, and politicization of the process of HC acquisition. The paradox of HCD and SDGs implementation in the context of this entry interrogates the political manipulation and interest sharing saga of the state government using the cooperative-society organizations (CSOs) approach in disbursing the HCI and empowerment scheme and the choice of who gets the rare opportunity for HCD in the civil service of Ebonyi state in particular and Nigeria in general.

There is no prior study on the link between SDGs policy implementation, HCIPs, and poverty reduction within the framework of institutional capacity-capability approach applied to the Nigerian context. This has implications for the attainment of a result-oriented Human Capital Intervention Reforms (HCIRs) and SDGs policy targets and indicators in Nigeria democratic governance since previous HCIPs research has paid little attention to the relevance and development of institutional capacity building within the Ministry of Agriculture and Natural Resources (MoANRs) and whether the professional personnel's (agricultural experts) were part of the conception/formulation of the various HCIPs and empowerment scheme in the state.

Based on established HCIPs and poverty reduction concepts and relationships, a conceptual model linking HCIPs, poverty reduction, and sustainability indicators in Ebonyi state MoANRs is introduced. The remaining part of this entry is structured as follows. Firstly, a brief review of literature (research background) on the nature of public policy, governance, and ideological leanings of previous HCIPs and poverty reduction efforts of governments in developing countries and the challenges in Nigeria's HCD system is presented. Secondly, the research methods used in this study are discussed. The third section presents the link between HCD and SDGs 1 and 2 targets and indicators; and also, the implications for Nigeria's project management and development. The fourth section presents and analyses the findings of the study. The final section concludes with a discussion of the findings and a review of the implications for future research in managing HCIRs.

## Conceptual and Analytical Framework

### Linking HCIPs, Poverty Reduction and Sustainability Indicators in Ebonyi State MoANRs

The conceptual model in Fig. 1 attempts to connect the different research questions in order to determine the dependent variable, FSP implementation (see below). The central research question is "To what extent are there clear strategies set for increasing the knowledge and skill of the policy drivers (bureaucrats) and the RPTBs for sustainable Agric policy implementation?" This analytical framework assumes that the human capital capability (HCC) of the policy drivers influences the quality of policy formulation and implementation of public policies. As well, the institutional capacity of the ministry influences the type of public policies that will be implemented by the government. These two intervening variables will also affect the initiation of HCIRs in the ministry. Generally, the HC condition and capabilities of the implementing agency and/or ministry (policy drivers) influence these variables collectively and individually, and this ultimately will affect the performance of Agric policy. The research model of the performance of the Ebonyi State Ministry of Agriculture and Natural Resources (EBSMoANRs) (see Fig. 1) depicts this.

**Paradox of Human Capital Development and SDGs Implementation in Nigeria, Fig. 1** Research model of institutional performance: Ebonyi State Ministry of Agriculture and Natural Resources. (Source: Ukeje 2020, p. 10)

The paradox of HCD and SDGs implementation in the context of this entry interrogates the political manipulation and interest sharing saga of the state government using the CSOs approach in disbursing the HCI and empowerment scheme and the choice of who gets the rare opportunity for HCD in the public service of Ebonyi state in particular and Nigeria in general. The practice of using cooperative-society organizations (CCOs) in disbursing the HCD interventions should be discontinued.

The use of local community-based poverty intervention mechanisms (LCBPIMs) is preferred as a better and result-oriented participatory governance/approach that encourages strong synergy between the citizens and the implementing ministry/agency. More so, empowering local-public stakeholders will enhance the quality and sustainability of public services.

## Research Background

### Linking Sound Governance Approach to Human Capital Development and SDGs Implementation: Policy, Obstacles, and Performance

In recent times, sound governance policy reforms remains one of the major machineries through which the society is placed at global perspective. According to Farazmand (2004, p. 81):

> Sound governance is presented as a more comprehensive notion of governance that encompasses the concept of good governance and sound public administration for all people. Governance is sound when it includes all people or their genuine representatives in the process of governance and administration without political or economic intimidation or domination by powerful elites operating on their own behalf or promoting the interests of global corporate elites of the Western governments.

The process of HCIRs and development must be so comprehensively conceived for the real food security policy (FSP) issues to be addressed (Ukeje et al. 2020b). Over the years and since the creation of Ebonyi state in 1996, the nature and practice of PPI for development by successive governments on tackling FSP and poverty reduction in Nigeria have severally been engrossed on provision of social services such as borehole, roads, credit schemes, agricultural extension services, tax and tariff administration, creation of empowerment, or endowment funds (credit scheme, conditional/non-conditional cash transfer (CCT), etc.) with little focus on tackling HCIRs from the capability-based approach through training and education of the policy drivers (bureaucrats) and the RPTBs in the various communities and villages of the state.

Though previous studies like Anger (2010), Anyanwu (2011), and Ojo and Adebayo (2012) have appraised the performance of various HCIPs for poverty reduction in Nigeria and other developing countries, they have not empirically investigated the capability of the policy-target beneficiaries (CPTBs) in the process of PPI in the remote communities of Abakaliki, Ebonyi State. The challenge is that the entire process of HCD through empowerment policy programs is riddled with politics while the RPTBs lack access, capacity, and training needed to succeed in the PPI process. Other research findings on governance effectiveness, institutional management, and policy reforms in Nigeria identified and implicated inadequate manpower development and poor HRs planning (Okpata and Ukeje 2011) as a major challenge to the provision of quality services, capacity building, and developmental services due to "external influences, nepotism and political cleavages" (Ndukwe et al. 2015) in the bureaucratic institution since bureaucracy without bureaucratization can provide an explanation for the underlying problems of inefficiency and ineffectiveness (Ukeje et al. 2019).

Presently, a UN development agenda has been initiated in the form of SDGs with about 17 goals, 169 targets, and 231 indicators (Ukeje et al. 2020c) as an extension of the expired Millennium Development Goals (MDGs) and aims to end poverty and improve the lives of the citizens in a sustainable and inclusive manner by 2030 (Jaiyesimi 2016; Ogu 2019). This study raises question on the preparedness/capabilities of Nigerian ministries, that is, the bureaucrats (human capitals) to drive the policy and achieve its results by 2030 since the immediate past 2015 MDGs of the United Nations (UN), in Nigeria did not achieve all the desired results as stated in the policy framework (Kauzya 2015; Ezirim et al. 2016; Thornton et al. 2018). Yet, human capital remains the key to unlocking national potential accompanied by greater productivity (Ndukwe et al. 2016; Ukeje et al. 2020a) and sustainability of the policy impact due to the nature of the actual economic and political environment (Ukeje et al. 2020c) in the country.

This is because institutional policy outcome is a function of participatory engagements of the right human capitals, skill, and orientation in the policy-making process. Thus, basic factors influencing policy failures and/or success includes lack of involvement of the RPTBs, training and re-training of the project team, external politics in the PPI stage, nepotism, and political cleavages (Ndukwe et al. 2015) in the selection of RPTBs in the project community. Okechukwu et al. (2016) also identified the practice of ". . .who sent you syndrome; complimentary card paradox or deification madness," as the reasons for policy failures in public bureaucracy.

Sustainable HCFSP and poverty reduction are driven by the institutional capacity of the implementing agency or ministries to meet the citizens required level of food consumption through practical HCIRs in a sustained and systematic manner to end rural poverty and hunger. Addressing HCIRs only in economic sense without recourse to the education and capability aspect has characterized Nigeria's HCI and development policies (Ukeje et al. 2020a). This underlines the focus of SDGs 1 – which aims to end poverty in all its forms everywhere, and goal 2 – End hunger, achieve food security and improved nutrition, and promote sustainable agriculture (UN General Assembly 2015; see Tables 1 and 2).

However, although countless development efforts (policies) were made by different

**Paradox of Human Capital Development and SDGs Implementation in Nigeria, Table 1** Specific targets of SDG 1 – end poverty in all its forms everywhere

| | |
|---|---|
| 1.1 | By 2030, eradicate extreme poverty for all people everywhere, currently measured as people living on less than $1.25 a day |
| 1.2 | By 2030, reduce at least by half the proportion of men, women and children of all ages living in poverty in all its dimensions according to national definitions |
| 1.3 | Implement nationally appropriate social protection systems and measures for all, including floors, and by 2030 achieve substantial coverage of the poor and the vulnerable |
| 1.4 | By 2030, ensure that all men and women, in particular the poor and the vulnerable, have equal rights to economic resources, as well as access to basic services, ownership and control over land and other forms of property, inheritance, natural resources, appropriate new technology and financial services, including microfinance |
| 1.5 | By 2030, build the resilience of the poor and those in vulnerable situations and reduce their exposure and vulnerability to climate-related extreme events and other economic, social and environmental shocks and disasters |
| 1.a | Ensure significant mobilization of resources from a variety of sources, including through enhanced development cooperation, in order to provide adequate and predictable means for developing countries, in particular least developed countries, to implement programmes and policies to end poverty in all its dimensions |
| 1.b | Create sound policy frameworks at the national, regional and international levels, based on pro-poor and gender-sensitive development strategies, to support accelerated investment in poverty eradication actions |

Source: UN General Assembly (2015, p. 14)

administration in the form of development plans from 1960 to date, Onah (2010) observed that Nigeria has gone through four national development plans (NDP), and has been engaged in the process and task of rolling out several development initiatives such as the Rolling Plans, Vision 2010–2020, the National Economic Empowerment and Development Strategy (NEEDS) in order to promote development, yet traces of poverty and hunger remain on the high side (Fatile and Ajulor 2018; Ukeje et al. 2020b). This is because the challenge of sustainable development and policy reforms in Nigeria public service is hinged on the practice of "bio-politics" and "geo-politics" determinants of who should be engaged following "kinship" (communal) and "geographical" political affiliations (Ukeje et al. 2020c).

Considering the above instances, it is worthy of note that institutional HCD remains the brain behind the attainment of 2030 global agenda in Ebonyi State. This entry therefore focuses on the effectiveness of HCIRs for effective implementation of SDGs (1 and 2) which aim to end poverty in all its forms everywhere and end hunger, achieve food security and improved nutrition, and promote sustainable agriculture by 2030 as a panacea for sustainable development in Ebonyi State, Nigeria.

Poverty reduction has been defined as strategic policy measures, both economic and humanitarian, that are intended to permanently lift people out of poverty (Ukeje et al. 2020a, p. 1) that is anchored on the three pillars of social, economic, and environmental preservation for the guaranteed present and future generations. HCD and poverty reduction should be guided by sound and friendly empowerment strategies that enhance self-reliance and self-esteem, through active participation of the right HCs in

**Paradox of Human Capital Development and SDGs Implementation in Nigeria, Table 2** Specific targets of SDG 2 – end hunger, achieve food security and improved nutrition, and promote sustainable agriculture

| | |
|---|---|
| 2.1 | By 2030, end hunger and ensure access by all people, in particular the poor and people in vulnerable situations, including infants, to safe, nutritious and sufficient food all year round |
| 2.2 | By 2030, end all forms of malnutrition, including achieving, by 2025, the internationally agreed targets on stunting and wasting in children under 5 years of age, and address the nutritional needs of adolescent girls, pregnant and lactating women and older persons |
| 2.3 | By 2030, double the agricultural productivity and incomes of small-scale food producers, in particular women, indigenous peoples, family farmers, pastoralists and fishers, including through secure and equal access to land, other productive resources and inputs, knowledge, financial services, markets, and opportunities for value addition and non-farm employment |
| 2.4 | By 2030, ensure sustainable food production systems and implement resilient agricultural practices that increase productivity and production, that help maintain ecosystems, that strengthen capacity for adaptation to climate change, extreme weather, drought, flooding and other disasters and that progressively improve land and soil quality |
| 2.5 | By 2020, maintain the genetic diversity of seeds, cultivated plants and farmed and domesticated animals and their related wild species, including through soundly managed and diversified seed and plant banks at the national, regional and international levels, and promote access to and fair and equitable sharing of benefits arising from the utilization of genetic resources and associated traditional knowledge, as internationally agreed |
| 2.a | Increase investment, including through enhanced international cooperation, in rural infrastructure, agricultural research and extension services, technology development and plant and livestock gene banks in order to enhance agricultural productive capacity in developing countries, in particular least developed countries |
| 2.b | Correct and prevent trade restrictions and distortions in world agricultural markets, including through the parallel elimination of all forms of agricultural export subsidies and all export measures with equivalent effect, in accordance with the mandate of the Doha Development Round |
| 2.c | Adopt measures to ensure the proper functioning of food commodity markets and their derivatives and facilitate timely access to market information, including on food reserves, in order to help limit extreme food price volatility |

Source: UN General Assembly (2015, p. 15)

the stages of policy process. Thus, both theoretical and empirical researches have been undertaken on human capital development, governance, and PPI in Nigerian democratic government (Anger 2010; Metu et al. 2016; Dialoke et al. 2017) in recent times but studies have failed to address the capability of the human capitals and the needs of public sector institutions. A recent study on the practice of HCI and PPI in Nigeria revealed that in spite of laudable policy programs embarked upon by different governments, the genuine poor farmers with passion and significant years of experience were undeservedly excluded from the empowerment opportunities (Ukeje et al. 2020b) due to the nature of our politics and the institutional environment. This has made the attainment of policy goals difficult. This is because effective provision and delivery of essential public services through implementation of government's programs and policies is the core object of public bureaucracy (Ukeje et al. 2019).

## Research Methodology

Given that the SDGs are yet new enough that conclusions regarding their achievement are too early to be well-formed, this study examined how HCD and institutional capabilities will be shown to support SDGs 1 and 2 implementation in Nigeria. Both quantitative and qualitative research methods were used in order to address the research questions highlighted in the study. This is because a single research method is deficient in providing sufficient and exact study results. This includes engagement of the RPTBs and some selected member of staff that has direct dealing with agricultural policies and the implementation of HC empowerment scheme in the ministry.

## Understanding the SDGs 2030 Agenda: An Overview

The SDGs are geared toward achieving the post-2015 development agenda of the United Nations which aims to end poverty and improve the lives of the citizens. However, recent study on the outcome of development policies showed that the immediate past 2015 MDGs in Nigeria did not achieve the desired results as stated in the policy framework (Ezirim et al. 2016). Thus, the scourge of poverty is still been felt by the majority of the citizens (UNDP 1998; Anger 2010). World over, public policies are implemented primarily by career officials working in government ministries and/or agencies (Offu et al. 2018). Career officials are responsible for coordinating, monitoring, and enforcing implementation activities (Ezeani 2006) of various HCFSP and poverty reduction schemes in the state. The capabilities of government bureaucracy in terms of expertise, skill orientation, and experience determine to a large extent the success or failure of implementation. Policy analysis and implementation is a multidisciplinary and systematic investigation aimed at gathering and analyzing information about likely consequences of public policies both before and after they occur (Ezeani 2006) and the activities that are carried out in light of established policies in other to facilitate reading of sound policy decisions. Thus, effective performance of public services is underpinned by certain core values, which include integrity, meritocracy, discipline, professionalism, patriotism, and impartiality (Idike et al. 2019).

Thus, following expiration of the Millennium Development Goals' (MDGs) and the adoption of the 2015–2030 United Nations (UN) Sustainable Development Goals (SDGs) with 17 Goals by world leaders on September 25, 2015, it is imperative to examine the ways in which HCD can help to achieve government implemented policy programs and poverty reduction since the SDGs are global bold commitment of promoting inclusive and sustainable strategy on the approaches that will produce solutions to the problems of poverty, food security, inequality and injustice, and tackle climate change by 2030 (Ogu 2019).

However, the nature of PPI for development by successive governments on tackling food security and poverty alleviation in Nigeria have severally been engrossed on provision of empowerment schemes with little focus on determining the human capital capabilities of various implementing agencies/ministries and whether end users of policies (RPTBs) possess the skill to respond to the challenges they may face in trying to implement food security policies in the state. Curiously, successive governments have been churning out policies after policies without taking the challenge posed by human capital development into account, especially the target beneficiaries of reforms in the remote communities of the state. Both the bureaucrats (policy drivers) and farmers are suddenly ambushed by policies they know little about and are ill-equipped to support. The result is often emergency make-shift interventions which come as short-term skill training, enlightenment programs, etc., also, in the arranged process, the main producers of food (the professional farmers) are left out, as the entire process is riddled with politics while the RPTBs lack capacity and training needed to succeed in the PPI process.

This entry therefore examines agricultural (food security) policies and poverty reduction

programs of the state government, with a view to underscoring the human capital challenges which had led to evident policies failures. Governments armed by what they perceive to be the problem of Nigeria and the solutions thereof have implemented various kinds of policies; some are outright new policies whereas others are modified versions of existing ones. All of these failed to launch Nigeria on the path of growth and development. This entry believing that agriculture holds the miraculous key that will unlock Nigeria's growth potentials looks at the other end of the human capital challenges and their implications for policies success or failures for the attainment of rapid sustainable ecological, economic, and sociocultural development in the economy. It is a modest contribution to the debate on policies for development, food security, and poverty alleviation.

## SDGs Analytical Framework and the Need for SHCI Policy Reform

From the targets of SDGs 1 and 2 as contained in Tables 1 and 2 below, it is imperative to state that SHCI policy reform through constant training and retraining of the policy drivers (HCs) and the RPTBs will help to drive the success and sustainability of the empowerment schemes in Ebonyi state. Since empowerment of citizens closes inequality gap through the outcome people/citizens' involvement in the project community and decision-making process.

The people's active participation can further lead to capacity building and policy sustainability. This agrees with scholarly position that skewed allocation of HCI benefits becomes an avenue to compensate and enrich political loyalists and acolytes to the disadvantage of intended target social strata (Ukeje et al. 2020a, p. 4).

In Ebonyi state, this target social strata lacks the HC capacity and capability to combat and manage the world global economic crisis, destruction of natural ecosystems leading to considerable losses in biodiversity, issues of global climate changes, extensive land degradation and deforestation, testing of soil pH, change in technology, pest and disease control, use of improved seedlings, increase in soil, air, and water pollution, flood, COVID 19, poverty and agricultural related challenges due to lack of training and capacity building, etc. The above stated issues have posed a serious challenge/threat to human survival and existence in this present era of SDGs across the globe. Even the presence of EBSMoANRs have not developed the capacity and capability to manage and/or deliver HCI policy framework that will help in addressing the issues in a sustained manner.

Table 3 shows that 88% of the participants strongly agreed that in spite of the role of the ministry and their involvement in implementing food security and poverty reduction program that poverty and hunger has persisted in the state in spite of laudable government intervention schemes/programs. Seventy-two percent of the respondents also agreed that the ministry had specific strategy/method for identifying those who benefit from the intervention scheme but that the selection processes is challenged by virtues of transparency, meritocracy, and professionalism due to the ever presence of politics and state-elite capture. This indicates that, in general, most of the professionals in the ministry had good knowledge and skill toward the success and/or failure of any policy but disagreed on the impact (outcome) of services provided by the extension agents. This is because most of the local stakeholders in the various 13 local government areas (LGAs) were not involved in the entire governance processes for sustainable food security projects. This has challenged the entire process of HCD – inclusion, eligibility, screening, identification, acquisition, training, and utilization because most of the RPTBs were not only selected on grounds of merit but were not trained on how to manage climate change challenges, soil pH, pest and disease control, use of improved seedlings, etc., before receiving the empowerment scheme from the state government, thereby affecting sustainable poverty reduction schemes/strategies at the local level.

**Paradox of Human Capital Development and SDGs Implementation in Nigeria, Table 3** Respondents' views on the nature of HCFSP and poverty reduction in Ebonyi state

| | Opinion | Strongly agreed (%) | Strongly disagreed (%) |
|---|---|---|---|
| **A** | **Determining the impact of HC food security program on poverty reduction in Ebonyi State** | | |
| 1 | Has your ministry been involved in implementing food security and poverty reduction program in the state? | 220 (88%) | 30 (12%) |
| 2 | Has your ministry had specific strategy/method for identifying those who benefit from the HC intervention scheme? | 180 (72%) | 70 (28%) |
| 3 | Has the previous HC intervention strategy been effective in reducing poverty reduction? | 117 (47%) | 133 (53%) |
| 4 | Has food security had significant impact on poverty reduction in the state? | 109 (44%) | 141 (56%) |
| 5 | Has the agro-empowerment scheme reduced poverty at the local level? | 78 (31%) | 172 (69%) |
| 6 | Is there a high level of awareness by the real farmers on government's food security program? | 69 (28%) | 181 (72%) |
| **B** | **The level of poverty rate in Ebonyi State despite the successive policy on poverty reduction by the government** | | |
| 7 | Do you think poverty has persisted in the state in spite of government intervention programs? | 157 (63%) | 93 (37%) |
| 8 | Do you think the use of farmers' cooperative society is effective in achieving food security? | 139 (56%) | 111 (44%) |
| 9 | Has the agro-empowerment scheme reduced poverty in the state? | 98 (39%) | 152 (61%) |
| 10 | Are there challenges facing the implementation of the agro-empowerment program? | 132 (53%) | 118 (47%) |
| 11 | Do the beneficiaries of the empowerment scheme lack knowledge/skill needed for poverty reduction? | 139 (56%) | 111 (44%) |
| 12 | Have many farmers benefitted from the agro-empowerment scheme? | 132 (52.8%) | 118 (47.2%) |
| **C** | **Challenges facing food security programs implementation in the state** | | |
| 13 | Are there adequate training facilities/programs for staff in your ministry? | 142 (56.8%) | 108 (43.2%) |
| 14 | Is there regular training of staff based on food security challenges in the state? | 119 (47.6%) | 131 (52.4%) |
| 15 | Have you participated from some capacity building programs like seminars, workshops, conferences, etc., in your ministry? | 137 (55%) | 113 (45%) |
| 16 | Are there programs designed by your ministry to manage issues of climate change, soil pH, pest and disease control, use of improved seedlings, etc. | 77 (31%) | 173 (69%) |
| 17 | Were the current beneficiaries of the agricultural intervention scheme trained on how to manage climate change challenges? | 98 (39%) | 152 (61%) |
| 18 | Are the selection processes of the food security policy program transparent? | 59 (24%) | 191 (76%) |

## Discussion and Policy Implications

In this era of SDGs, it is pertinent to state that empowerment of the right HCs at both the institutional and community levels will serve as catalyst for socioeconomic development and sustainability of any developmental project in Nigeria. They are a veritable vehicle for the achievement of national policy objectives in terms of PPI. However, based on the findings of this entry, the major challenge facing the attainment of SDGs 1 and 2 in Abakaliki metropolis is lack of HCD of the implementing ministry/agency to enable them to acquire more skills to drive the policy and the noninvolvement of the RPTBs in the various stages of the policy cycle – project identification, planning, implementation, monitoring, and evaluation. This agrees with the assertion that "interventions targeted at the poor were characterized by exclusion and inclusion

mechanisms in which the privileged political agency profiteers hijacked the intervention opportunities, thereby unjustly displacing RPTBs" (Ukeje et al. 2020a, p. 4).

## Conclusion

For organizational effectiveness and sustainability, HCD policies must be sound, efficient, impartial, and free from politics in order to be able to implement government policies (see Table 3). This entry examined the paradox of HCD and SDGs focusing on goals (1 and 2) policy implementation framework for the attainment of poverty reduction and food security program in Ebonyi state, Nigeria. The motivation behind this research is based on the fact that several development efforts taken by successive governments in tackling food security and poverty reduction in the state since creation in 1996 to date have often ignored the HCD need of the "policy-drivers" and the RPTBs for PPI success and sustainability in the policy agenda. The study revealed the need for EBSMoANRs to review its civil service operations and establish clear-cut HCD strategies that are in sync with the framework of SDGs 1 and 2 policy targets (see Tables 1 and 2) to be able to implement government policies. This will help to eliminate inefficiency and corruption in the development of right HCs based on need assessment indicators and sustainability (see Fig. 1).

For the attainment of sustainable HCIPs in Ebonyi state, the practice of using CSOs in disbursing the HCI schemes should be discontinued. Importantly, the professional personnel's (agricultural experts) in the federal and state tertiary institutions like the faculties of agriculture at both the Alex Ekwueme Federal University, Ndufu-Alike and the Ebonyi State University, Abakaliki should be involved in the conception (policy design) of the various HCIPs in the ministry. This will lead to the development of institutional reforms and capacity building for sustainability within the ministry and beyond. Moreover, the use of LCBPIMs is preferred as a better and result-oriented participatory governance/approach that encourages strong synergy between the citizens and the implementing ministry/agency (Ukeje 2020). The study argues that challenges bordering on faulty implementation of HCD and poverty reduction strategies has negatively affected policy sustainability and so recommend alternative models for enhancing HCI outcomes and performance. Thus, the need for new HCIRs in the ministry for the attainment of SHCI policy reforms and sustainability remains a sine qua non for the attainment of sound governance in the state.

# Paradox of Professionalization in Public Administration

Beverly A. Cigler
Penn State Harrisburg, Middletown, PA, USA

## Synonyms

Bureaucracy; Deep state; Permanent career civil servants; Professionalism

## Introduction

As US governments grew and bureaucratic responsibilities expanded, especially accelerating in the 1960s, the professionalization of permanent career bureaucrats at all levels of government increased significantly. As early as the 1960 census, American governments had become the main employers of professionals. More than a third of all professional, technical, and related US workers employed by government possessed professional or technical expertise in identifiable and specialized occupations that required at least a college degree, affording a lifetime career opportunity. By the late 1970s, the national government no longer mirrored the popular image of countless clerks processing piles of forms; instead, it was approaching the structure of a research and development firm. Beginning in the 1950s, state and local governments began growing even faster than the national government and became professionalized by hiring teachers, social workers, planners, engineers, city managers, and other professionals. States reformed their legislative, executive, and judicial branch structures and state and local governments made considerable reforms in merit hiring.

During the same period, however, popular appreciation of and respect for government service, and career public servants, began to decline and that has steadily occurred since the 1950s, with just two exceptions: a short period in the 1990s during the Clinton presidency and immediately after the 9/11 terrorist attacks. Writing in 1990, Cigler called the increasing professionalization of permanent career bureaucrats at all levels and their decreasing acceptance by their clients – citizens and political elites alike – the "paradox of professionalization." She claimed that this paradox was arguably the most important factor facing the public service at that time. This entry reviews key aspects of the paradox of professionalization. Once again, the undiminished trend of discrediting the bureaucracy with its career public servants – not political appointees – suggests danger to the public service and the performance of its responsibilities. The permanent career bureaucrats are employees of the national,

state, and local governments that do not include military and postal workers, although aggregate employee numbers are provided for context.

By 2020, nearly 24 million people, comprising a little more than 15% of the US workforce, serve in the military or public and national service at the national, state, and local levels of government. Of those, about 16 million are state and local government employees and two million or just over 1% of the US workforce (0.6% of the total US population) are permanent employees of the national government. The military has about 1.4 million active duty service members and 800,000 reserve forces and there are 800,000 postal workers. More than 70% of the national workforce serves in defense and security agencies such as the Department of Defense (DOD), agencies within the intelligence community, and the National Aeronautics and Space Administration (NASA) (Hill 2020).

## Growing Distrust of Government and Its Employees

There is a growing and deep distrust of the US national government, with greater trust afforded to the states and their local governments. For example, a Pew Research Center poll in April 2019 found trust in the national government continuing to be at an historic low of just 17% claiming trust in the national government to do the right thing "just about always" (3%) or "most of the time" (14%). A large majority (71%) say that they trust in that level of government only "some of the time" and 10% claim that they "never trust the national government." The distrust is persistent and it was only during President George W. Bush's second term that as many as a third of Americans claimed to trust the national government most of the time. Only during a brief period of several months after the 9/11 terrorist attacks public trust surpassed 50%.

The increased trust after 9/11 suggests that a triggering event can test citizenship, however the global pandemic that arrived in the US early in 2020 has not been such a trigger. August 2020 polling by Pew Research Center shows that public trust in the national government continues to remain in the all-time low category with just 20% of adults claiming to trust the national government to "do the right thing just about always or most of the time" (2020).

On the other hand, there is considerable support for the functions performed by public servants at the local and state levels. While there is widespread support for the many essential services provided by government, a number of misperceptions lead to negative views of government in general. Specifically, the public generally thinks that government is too big, unmanageable, and wasteful. Bureaucracy bashing has become commonplace in American electoral politics and society in general. It was a central theme for the presidential election victories of Nixon, Carter, Reagan, and Trump. Although Trump lost his bid for a second term, the anti-bureaucracy language he used in his campaign reached a new level of distain for bureaucracy and career public servants. His rhetoric about "draining the swamp" in Washington and eliminating the "Deep State" became popular responses to bureaucracy and bureaucrats by millions of supporters. The distain and lack of trust has not decreased as followers anticipate another bid for a second term and the former president's disdain for bureaucrats continued after he left office. There is less evidence of sustained bureaucrat bashing at the state and local levels, however.

The "draining the swamp" language perpetuates a key misconception about the national government, which is that it is located primarily in Washington, D.C., and disconnected from the rest of the country. In fact, 85% of the national career bureaucrats work outside of the nation's capital in federal regions across the nation. They deal with the gamut of national programs in health care, housing, disaster management, border security, environmental protection, energy supply, welfare, education, weather forecasting, agriculture and food safety and supply, national parks and public lands, small business support, and much more.

## Big Government

A government too big, unable to be managed, and too wasteful would likely lead to an erosion of

trust, but this topic suffers from a perception vs. reality problem that remains unresolved. Big government can refer to the number of people it employs. Big government can refer to how much it spends. Big government can refer to how much it regulates. And, big government can refer to how much it does. This section of the essay relies primarily on data provided by Dilulio (2017) writing on "big government" for the Brookings Institution.

In terms of its number of employees, the national government has about the same number of employees, not counting the uniformed military or postal workers, as it has had for nearly 60 years. In 1960 there were 1.8 million full-time national civil servants and that was about the same number as in 2000, for example. In 1984 there were 2.2 million full-time national civil servants, which was actually about 200,000 more employees than during Obama's presidency that began in 2008. As stated earlier, the permanent career national government workforce has about two million employees. On the other hand, the growth of state and local governments in terms of number of employees has skyrocketed. These are the "persons next door" – school teachers, police, emergency medical technicians, professional municipal managers, water and sewer plant operators, parking garage attendants, and all the others relied upon to deliver vital public services.

It is government spending that has increased greatly. Adjusting for inflation, national government spending has increased fivefold since 1960. Specifically, it doubled between 1960 and 1975 and doubled again between 1975 and 2005. The spending increases coincide with government doing much more than in the past – in old and new policy areas. New agencies have been created, such as the Federal Emergency Management Agency and the Department of Homeland Security. New laws, regulations, and programs were created since the Great Society programs of the 1960s, the attack on 9/11, and more recently the COVID-19 pandemic that emerged in 2020 in the USA. The Great Recession that began in 2008 and Covid-19 pandemic relief fueled astronomical spending in the trillions. The national government is now very active on issues for which it had little responsibility in previous decades. Drug abuse and crime policies; LGBTQ+ issues; gun control; occupational safety; enhanced educational quality; environmental, energy, and climate policies; health insurance; pandemic relief; increasing numbers and severity of natural catastrophes; broadband and other technological issues; new, rehabilitated, and better maintained physical infrastructure; and much more have been added to an ever expanding agenda and many of the programs involve funding and regulations applied to state and local governments that lead to their expansion also. Increased spending leads to new regulations geared to ensuring accountability. Government is much more complex but also much more expensive.

The delivery of the vast amount of government programs not only involves regular government employees at all levels, but also third parties such as thousands of nonprofit organizations and for-profit businesses. Although the state and local workforce expanded significantly from about two million full-time public servants in 1960 to more than 18 million employees currently, the national government also uses paid consultants and contractors, i.e., for-profit businesses, for accomplishing nearly all of its responsibilities. This amounts to about 7.5 million private workers, up from about five million in 1990. A prominent example of the contract relationship is the DOD and its use of private defense contractors. DOD has between 700,000 and 800,000 full-time equivalent civilian workers plus the full-time equivalent of 620,000–770-000 for-profit contract employees. This is a surprising and growing ratio of government to for-profit workers. Relatively few citizens understand the numbers, work responsibilities, operations, or outcomes.

Similarly, the delivery of government programs relies heavily on employees in the tax-exempt nonprofit sector that government also employs. That sector more than doubled between 1977 and 2012 to more than 11 million workers largely delivering social services. Dilulio (2017) explains that the nonprofit sector consists of 11 million employees and receives a third of its revenues from government. Estimating that if only a fifth of these employees hold jobs

stemming from intergovernmental grants, contracts, or fees, that would be 2.2 million workers. His conservative state and local government estimate adds another three million more employees funded by the national government.

To summarize, the national government employs about two million permanent career public servants but millions of additional jobs are funded in the for-profit and nonprofit sectors and state and local governments. Nonprofits receive substantial revenue from grants and fees for services and goods from government. Nonprofit contractors generally receive higher wages than their government counterparts. National government funds to states are passed to local governments and nonprofit organizations such as many hospitals, universities, religious charities, and other entities.

So, the national government has three million career employees but funds roughly another 12 million plus workers (7.5 for-profit, 2.2 nonprofit, and 3 state and local). Importantly, "big government" is heavily financed by debt with services frequently delivered and programs administered by third parties. The general public hears a lot about and complains about increasing debt but has little understanding about third-party government. By March 2021, the national debt had reached 28 trillion dollars. With misunderstanding and misplaced perceptions, the general public has long wanted more and better services and is generally satisfied with service delivery, but has significant mistrust of the national government, including permanent career bureaucrats. In addition, distinctions are not usually made between the career officials and politically elected office holders when judging bureaucracy.

## The "deep state"

President Donald Trump essentially declared war on what he referred to as the "deep state," which he believes to be the permanent career bureaucracy basically conspiring to prevent him and his administration from implementing his agenda. During his presidency his belief was aided by the right wing media and he made his argument continuously with tweets and speeches referring to the deep state and his goal of "draining the swamp," i.e., members of the career public service.

Most presidents have been frustrated with the permanent bureaucracy, but they have not engendered hostility through rhetoric calling careerists "traitors" or suggesting that they are incompetent or refusing to accept their expertise. Instead, presidents have followed traditional measures to make desired changes in procedures, laws, or regulations. They have respected the views that the careerists primarily act as impartial followers of the "rule of law," not as lone or coconspirators to undermine a president's agenda and actions.

## Conclusion

It is arguable that the recent characterization of the permanent career bureaucracy as the so-called deep state has further increased distrust of government by the general public. It is uncertain whether a triggering event that tests citizenship will engender increasing trust in government and respect for public servants. The need for more civic education for US residents regarding how government and its employees approach and implement their responsibilities is gaining interest. Public administration programs that educate students for public service are focusing on ways to build trust in government, knowledge of how government works, and the successes of the career bureaucracy. Research is needed more than ever on the relationship between public trust in government and public servants and government performance.

# Participation in Public Policy: Brazil

Suylan Midlej e Silva
Public Policy Management Department, Postgraduate Program in Administration, University of Brasilia, Brasilia, Brazil

## Synonyms

Participatory democracy; Public policy management; Social participation

## Introduction

The participation of citizens in public policies in Brazil began to be exercised in a more systematic and institutionalized manner after the redemocratization of the State at the end of the 1980s. It is not that Brazilian society has only awakened to participatory action in this period. After all, it is a process of political maturation, in which "participation is conquest," as Demo (1999) states. Due to the strong social mobilization that took place during the constituent process, the 1988 Federal Constitution itself began to provide for citizen participation in the public policies management at the federal, state, and municipal levels. Society called for direct participation in government decisions, reacting to the military dictatorship that prevailed from 1964 to 1985.

Since the 1970s, social movements have been promoted by the Basic Ecclesial Communities (CEBs). Emerged around 1975 in the bosom of the Catholic Church, they were premised on the theology of liberation. More than a religious movement, the CEBs acted, first, as foci of resistance to the military regime and then, in the organization of society around the struggle for civil, political, and social rights with the population of the urban peripheries.

Religious work was directly linked to a "political awareness effort." The CEBs expanded throughout the country, reaching rural areas, and by 1985 there were already around 80,000 nuclei (Carvalho 2014). The popular mobilization triggered by the CEBs resulted in the campaign for direct elections for president, in 1984, and in broad popular participation in the National Constituent Assembly, starting in 1987, when there were extensive consultations with organized sectors of society. It is worth mentioning the existence and performance in the same period of other social groups organized under the inspiration of various institutions, such as trade unions, class associations, and political parties. In the case of the rural area, the Pastoral Land, linked to the Catholic Church, was of paramount importance, later contributing to the creation of the Movement of Landless Rural Workers (MST).

The mobilization of society in the construction of the 1988 Constitution was fundamental to the institutionalization of social participation in public policies. From the new Constitution, several institutes of participation in the Brazilian federal spheres – union, states and municipalities – were regulated, with new roles for civil society organizations being recognized, which began to be represented in the various mechanisms of participation established in constitutional norms, such as participatory councils, commissions, or committees; public hearings; public consultations, ombudsman's offices, referendum and administrative plebiscite; social organizations; and participatory budgets, the latter not provided for in federal law but present in state and

municipal laws (Perez 2009). In fact, since its inception, the participatory budget has occurred in a self-regulated manner, with the creation of laws after its operation.

This entry intends to describe how the participation of the organized civil society in the public polices management has been given since the period of the redemocratization of the Brazilian State, more appropriately, from the decade of 1990, with the creation of institutionalized spaces of participation, fomented, either by the pressure of the society or by the own State. It also intends to discuss the relation between the models of public management and the effective participation.

The text is divided into the following parts: conceptual discussion on participation and public policies; presentation of participatory institutions, characterizing their formal and informal institutional designs; examination of the relationship between social participation and management models of Brazilian public administration; and dissertation on the models prevailing since the 1990s, after the first direct election for president after the military regime.

## Framework

In order to discuss participation in public policies, it is essential to conceptualize the two terms. The definition of participation is very imprecise and can have several meanings. In a broad sense, participation is a process in which two or more parties mutually influence each other in decision-making (Pateman 1992). Pateman (1992, p. 96), however, emphasizes that "being in a position to influence a decision is not the same as being in a position to (have the power to) determine the result or make that decision." Based on Rousseau's political theory, the author states that participation has a psychological effect on those who participate, establishing an interrelationship between the functioning of institutions and the attitudes of individuals who interact within them. This would be a premise of the theory of participatory democracy and of the theory of democracy as a whole.

Pateman (1992, p. 39) also emphasizes that "the more the citizen participates, the more he becomes qualified to do so." In the same vein, Gohn (2011, p. 333) states that "there is an educational character in the act of participating, both for members of civil society, and for the more general society, and also for the public bodies involved - when there are negotiations, dialogues or confrontations." Of course, the authors are not referring to a mere participation, without commitment to the final result. Nor are they subtracting the need for these spaces to be democratized structures. They are referring to a participation of both individuals and social groups that aim to take part in decision-making processes, influencing their results. This is not a question of political participation, in the sense of representative democracy, illustrated by the electoral process, but of participation beyond episodic votes.

As Arnstein (1969) puts it, there is a difference between going through the empty ritual of participation and the real power to affect the outcome of the process. The central point of his thesis is that effective participation requires the distribution of power. She observes that there are gradations of participation and, through what she calls the Citizen Participation Staircase, demonstrates that there are levels of citizen involvement starting from eight steps. The highest levels (8) Citizen control, (7) Delegated power, and (6) Partnership represent more power for the citizen to negotiate with those with decision-making power, often occupying decision-making seats.

Level (5) Pacification represents a minimum concession of power, a permission for a kind of advice, but decision-making power remains with those in power. Levels (4) Consultation and (3) Information are considered to be levels of limited empowerment, with stakeholders having a right to hear and be heard, but no guarantee that their views will be accepted by those in power. The lower levels of the ladder (2) Therapy and (1) Manipulation describe levels of "non-participation," created to replace genuine participation. According to the author, the aim is not to allow people to participate in planning or conducting programs but to empower power

holders to "cure" or "educate" participants (Arnstein 1969). In summary, Arnstein (1969) considers that participation does not mean physical presence of individuals in the processes but effective power of citizens in decision-making.

Fung (2006) goes beyond this interpretation, considering the complexity of situations and the multiplicity of institutions of participation. For the author, there are three varied dimensions of participation. The first should be concerned with "who participates," emphasizing the importance of participatory processes being open to all who want to participate and not to a select group, according to interests. For the author, it is important to notice if the participants are representative and have the competence to give their opinion on the themes. Furthermore, it is necessary to ensure a way of selecting participants that is as inclusive as possible. The second dimension is "how the participants communicate" in the spaces of discussion and public decision-making. It reinforces that participants need to step out of the place of mere spectators and listeners to effectively participate in decisions, invoking their preferences to turn them into a collective decision. Communication between participants can be more or less intense. The third is "how discussions among participants influence public action." It is about measuring the impact of public participation on decision-making, with the participants' influence on public policy varying from the least influential to the most influential.

Gohn (2011) also identifies levels of citizen participation in decision-making processes of power. In Brazil, they are expressed in public spaces established to give shape to citizenship rights, such as councils, plenaries, forums, and other possible institutions that can be created according to the demands and groups. Therefore, it is considered as citizen participation or social participation any action organized by multiple actors of society to solve collective problems, with the power to interfere in institutional processes and public policies. The practice of social participation occurs in different cultural contexts and is re-signified from the sociopolitical and economic scenarios.

In a study report coordinated by the Ministry of Planning, Budget and Management, in coordination with the General Secretariat of the Presidency of the Republic of Brazil, between 2010 and 2012, social participation is seen as a method of government and means "the establishment of democratic governance and management in policies and public institutions, based on transparency, accountability, accountability, citizen/democratic control and co-management" (Brasil 2013, p. 17).

Other authors prefer to conceptualize social participation as "social-state interface" (Pires and VAZ 2012), emphasizing not only the role but the influences and impacts of the various participatory institutes. The social-state interface is understood "as a space of exchange and conflict in which certain actors are intentionally interrelated, since it allows understanding the power logics implicit in these relationships and identify more clearly the weight of some actors in specific contexts" (Isunza and Hevia 2006, p. 89). This conceptualization is well suited for a more detailed investigation of the impacts of the channels of dialogue between state and society within the framework of public planning. However, this entry chooses the term social participation because it is associated with the articulations between State and society more broadly, within a debate on the allocation of resources and distribution of goods and services related to various public policies.

Among the various existing concepts, public policies can be considered as what the government chooses or does not do (Dye 2013). They are also seen as "a system of public decisions aimed at preventive or corrective actions or omissions aimed at maintaining or changing the reality of one or more sectors of social life, by defining objectives and strategies for action and allocating the resources needed to achieve the objectives set" (Saravia 2007, p. 29), or, still, as one or more guidelines designed to address a public problem that is collectively relevant (Secchi 2014).

Emphasizing that the public should be the ultimate source of political authority, Birkland

(2016, p. 8) recalls that it is possible to distinguish some attributes of public policy, such as:

- The policy is made in response to some kind of problem that requires attention.
- The policy is made in the name of the "public."
- The policy is oriented toward a desired objective or state, as the solution of a problem.
- Policy is ultimately done by governments, even if the ideas come from outside government or through interaction between government and non-governmental actors.
- Policy is interpreted and implemented by public and private actors who have different interpretations of problems, solutions, and their own motivations
- Politics is what the government chooses to do or not to do.

More recently, several authors (Muller 2002; Lascoumes and Le Galès 2012; Andion et al. 2017) propose another interpretation of the term public policy, preferring the notion of "public action." This can be seen as a "collective action," in response to a public problem, "promoted by different public and private actors, at different levels and decision-making," and that goes beyond government action (Andion et al. 2017, p. 372). There is also a reinterpretation of the roles of the State and the government, and these roles are shared among actors and institutions.

Nogueira and Di Giovanni (2013) summarize public policies as a specific type of political action. "Ideally, they are advanced manifestations of dialogical and democratic rationality that typifies the modern world, contrasting, in this respect, with other forms and structures. They can coexist with these other forms and even combine with them, but they are something particular, endowed with their own logic" (Nogueira and Di Giovanni 2013, p. 3). That is, in spite of the countless definitions, each society develops its pattern of public policies, in the sense of doing or confronting public problems.

More due to pressure from society than to the action of the State itself, state interventions in Brazil have involved a plurality of actors, contemplating their diversity and their different interests. However, depending on the sociopolitical context, at the state level, there has been a reconfiguration of political conduct, rules, administrative structures, and the public policies management, ranging from more shared and democratic procedures to the banning of participatory institutions.

## Participating Institutions in Brazil

Participatory institutions in Brazil are not something new. Brazilian civil society has always been organized in diverse formats of social struggles, but the configuration of institutionalized spaces for participation took on a new guise after the Federal Constitution of 1988. Since its promulgation, 75% of national councils and commissions have been established (Avelino et al. 2018). The relationship between the State and society has changed with regard to decision-making processes, especially in the area of public policies, giving organized civil society greater participation in government actions and control of public administration. A relevant example of this configuration was the participation of civil society in the implementation of the Unified Health System in a decentralized manner at the three federal levels, through the health councils.

Participatory institutions (PIs) can be conceptualized as "differentiated forms of incorporation of citizens and civil society associations in the deliberation on policies," being possible to point out three forms of participation in the process of political decision-making (Avritzer 2008, p. 45). The first is the bottom-up participatory design, such as the participatory budget in Brazil, when delegates and councilors are elected by the population. The State acquires an important role in the implementation of this initiative; however, a bottom-up institutionality is created. The second way is through participatory institutions functioning within a process of power sharing between state actors and civil society actors, such as public policy councils. It differs from the participatory budget in that it incorporates a smaller number

of social actors and is determined by law, with sanctions in cases where the participatory process is not established. The third form is that of a participatory institution that operates within a process of public ratification: social actors do not participate in the decision-making process but can publicly endorse it, as in the case of Municipal Master Plans, with mandatory public hearings (Avritzer 2008).

The participatory budget still exists in Brazil, but it was an experience that had its peak in the 1990s, started in the city hall of Porto Alegre, in the south of the country. It includes social actors, representatives of neighborhood associations, and citizens in general in a process of negotiation and deliberation that takes place in a participatory stage, with direct participation, and a representative stage, through the election of delegates and councilors (Avritzer 2013). The participatory budget has become a registered trademark of the management of the Workers' Party, having been extended to 201 cities (Avritzer and Wampler 2008). According to Pires and Nebot (2013, p. 18), the participatory budget consists of "a methodology of budgetary decision that points in the direction of a democracy beyond the liberal representative, in which the roles of the actors involved are not so clear and schematically established and divided." It is worth noting that the PB is not in force as a participatory institution in the Brazilian Federal Constitution, which does not minimize its importance.

The participatory institutions with the most repercussions in Brazil are the public policy councils. Their constitution was inspired by the structure of the popular councils of the 1970s that fought for improvements in infrastructure and urban services and for better living conditions but had only a consultative character (Gohn 2003). The management councils, created from the 1988 Federal Constitution, have a deliberative character, with the possibility of greater participation by civil society in public policies. In this way, new social actors began to occupy the public spaces of elaboration and accompaniment of public politics. These institutions function in an equal manner, with the participation of state and social actors, at the federal, state, and municipal levels, for discussions of various policies.

Since the 1990s, other IPs have been operating in Brazil, but in different ways according to the characteristics of the political system, the structuring of public administration, and the sociocultural context. The formal and informal institutional designs of these participatory institutions will be presented (Brasil 2013).

- Public policy conferences – these are large public meetings between representatives of the State and civil society that make proposals for the implementation of specific public policies. They are planned to take place biannually, with discussion and determination of issues and normative directions of thematic areas in public policies. The conferences generally take place at the three levels of government, starting with the municipalities, and the negotiations advance according to each level, with participation open to the public, but with voting power only for delegates at the state and national levels, chosen in the scope of municipal conferences.
- Public ombudsmen – institutions that act in the process of interlocution between the citizen and the public administration, aiming at improving the public services provided based on the manifestations of the citizens. Generally, there is an ombudsman's unit in the structure of public agencies. The Ombudsman's Office allows citizens to participate in public management and carry out social control over policies, services, and public servants.
- Public hearings – face-to-face public meetings promoted by the government around specific themes, with the participation of individuals and interested groups. Its objective is to discuss certain aspects of a public policy.
- Public consultations – instruments similar to public hearings, with the same objective of discussing specific demands. The difference is that it does not occur in person, but through distance voting tools, such as Internet and telephone.

- Working groups – space for debate and proposition on a specific theme or for monitoring a political process. There may be strictly governmental working groups (with representatives of civil society as guests), joint working groups, and working groups with a majority of representatives of society.
- Negotiation tables or dialogue tables – a government initiative in response to the representation and/or demands of entities or social movements with a view to resolving eventual and/or potential conflicts. This type of experience occurred in the Lula administration, such as the National Table for Permanent Negotiation with Public Servants, established in 2003; the Minimum Wage Negotiation Table, established in 2005; and the Dialogue Table for the Improvement of Working Conditions in Sugarcane, established in 2008.
- Participatory Multiannual Plans (PPAs) – in 2003, the federal government established, together with various networks and forums of civil society organizations and social movements, a pioneering participatory process of popular participation in the PPA 2004–2007, with plenary sessions in the states of the federation. In 2011, it started a new process of participatory monitoring of the PPA 2012–2015, creating a space of participation called Interconselhos Forum, with representatives of the civil society of diverse National Councils and of other organizations, networks, and social movements.

In addition to these established mechanisms of social participation, virtual channels of all kinds, via the Internet or telephone, have been created to issue opinions, suggestions, and criticisms about the public policies management in various places in the country, and constant participation of civil society has been observed.

## Models of Public Management and Social Participation

In spite of the advances that have taken place all over the world in the relationship between state and society, including in Latin American countries, social participation in the public policies management still has a very direct relationship with the management models adopted by public administration, according to the development model that each government puts into practice. And this could always be seen in Brazil, since the formation of the Brazilian State at the beginning of the nineteenth century, which was constituted within an oligarchic and patrimonial model, when a mercantile agricultural economy and a society of class still enslaved prevailed (Bresser-Pereira 2001).

The passage from patrimonialism to the Weberian bureaucracy, even if it did not occur definitively, was an advance in terms of countless administrative processes but still without opening for the participation of organized society in public administration. The predominantly bureaucratic model remained in force until the dictatorial period of 1964–1985, configuring an authoritarian model of public administration, with emphasis on technocratic insulation. As a consequence, it removed any attempt by civil society to participate in the actions of the State, as well as in political life in general. The democratic transition, especially with the promulgation of the 1988 Constitution, began to allow society to participate in a more institutionalized way in public policies and public administration, but the relationship between the State and society had not yet undergone a substantial change.

Since 1995, under the auspices of New Public Management, Brazil has undergone an administrative reform known as managerial reform. The government discourse was based on decentralization as a way out for the modernization of public administration, oriented to the citizen and to obtain results (Bresser-Pereira 1996). A specific ministry was created to promote the reform, and the Master Plan for the Reform of the State Apparatus was elaborated. In addition, Constitutional Amendment No. 19 of 1998 was issued, introducing in art. 37, §3, a general rule on popular participation in the public administration, establishing periodic evaluation of public services, user access to information on the

government, and social control of position, employment, or function in public administration (Perez 2009).

However, for Paula (2005), the managerialist model did not break with technocracy. Despite the participatory discourse of the new public management, "the structure and dynamics of the post-reform State did not guarantee an insertion of civil society in strategic decisions and the formulation of public policies" (Paula 2005, p. 141), keeping the State away from society. Faced with closed management models within the state itself, social movements and organizations have been demanding a participatory and deliberative conception of democracy, demanding its participation in decision-making processes and in the implementation of public policies (Silva 2001).

As Perez (2009, p. 36) states, "democratic development, reflected in the constitutionalisation of participatory democracy, is one of the founding reasons for the institutionalisation of popular participation in decisions and in the control of Public Administration." In this way, citizens are guaranteed specific rights of participation, leading to the creation of new forms of action of the public administration, which change their relationship with those managed, with their agents and with their hierarchical structure (Silva 2001).

The efficiency of the administrative action would be related to the adherence of society and its active action, and this leads to the need to use instruments that seek the consent of the community (Perez 2009). The legitimacy for the success of public policies would come as a result of this adherence of society "to a set of concrete measures, policies, or programs that it helped to formulate, decide and often execute" (Perez 2009, p. 221). While Weber understands that the functioning of the public administration is centered on the trinomial bureaucracy, efficiency, and legitimacy, Perez (2009) is based on the trinomial participation, efficiency, and legitimacy. For him, participation would be a way to break with the distance between society and the administration, bringing this administration closer to social and political conflicts and delegating responsibility also to the entities of society. Unlike the bureaucratic model, which defends the autonomy of the administration in relation to society, delegating only to administrators the technical and professional management of public services.

This model of public management more open to social participation emphasizes the sociopolitical dimension within a societal perspective, based on the proposals of social movements against the dictatorship and by the redemocratization of Brazil in the 1970s and 1980s and inspired by the experiences of the management councils and the participatory budget (Paula 2005). This project gained a new dimension with the victory of the national popular alliance with the 2002 presidential elections, under the call for greater participation of organized society in public administration (Paula 2005). One of the precepts of societal public administration is the creation of institutional formats to facilitate popular insertion and a public management that does not centralize decision-making processes in the state apparatus. It would be a kind of co-management of public administration. Other nomenclatures are used to refer to this management model, such as the New Public Service (Denhardt and Denhardt 2003; Andion 2012) and Public Governance (Bernier et al. 2003).

In 2003, one of the changes made in the political-institutional dimension by the new Brazilian government that influenced the nature of social participation in the country was the change in the attributions of the general secretariat of the Presidency of the Republic, which until 2002 had attributions linked to parliamentarians, with the general secretary having the role of coordinating relations with civil society actors, by means of Law Decree No. 4570 (Avritzer 2017). New national councils were also created in the areas of social and public policy, increasing from 15 to 31 during the first presidential term; and between 2003 and 2010, there were 74 national conferences; these spaces already existed in Brazil but gained a new role in the federal government (Avritzer 2017).

Between 1985 and 2013, Brazil developed a pattern of participation among the poor, those with income between one and five minimum wages, with up to 8 years of schooling, different from the pattern of participation developed in the democracies of the North, focused more on the

participation of the middle class (Avritzer 2017). One of the main consequences of this process, highlights Avritzer (2017), was the impulse in distributive social policies promoted by the state, at local and federal levels. As of 2014, new political compositions in the National Congress provoked changes in the political and governmental context, and in 2016, President Dilma Roussef was removed from office by an impeachment process. But until 2016, it was possible to count 40 public policy collegiate groups, composed of national councils and commissions (Avelino et al. 2017), in addition to thousands of other collegiate groups existing in states and municipalities.

In summary, it is possible to state that from 2003 to 2016, there was a considerable opening of public administration to social participation in the public policies management, far from representing an ideal relationship between the State and society regarding decision-making processes in an effective manner. However, in view of the current situation in which the country, since the beginning of 2019, has been under the baton of a presidentialism explicitly intolerant of social participation, there has been a regression in terms of channels of participation. The main example was Decree n° 9.759, of 11/4/2019 (Brazil 2019), which provides for the extinction of participative institutions existing since the decade of 1990. The decree is still under discussion in the Federal Supreme Court and represents a decrease in many of these institutions.

It is a fact that social participation in public policies does not depend solely on the opening of mechanisms on the part of the State but is based on the assumption that the State can be a public space par excellence for the preparation and execution of public policies, with the participation of social and state actors. This positive vision of the State is based on the possibility of direct participation and social control of citizens in state actions.

The negative view of the State considers it to be "an undemocratic place and submitted to a rationality that privileges the adequacy calculated between means and ends, and sometimes it departs from the sovereignty of the people to submit to the interests of preferential groups (...) favoring the use of the State as a means to preserve and reinforce distributive privileges" (Costa e Cunha 2009, pp. 84–85). This negative view is based on the mistrust of the State as a democratic space, capable of enabling equity in debates on the public policies management.

It is possible to bet on the positive view of the State, even considering the susceptibilities that civil society may experience, depending on the management models adopted by governments at all levels: municipal, state, and national. This is because the State is a space for disputes between various groups, even though historically the power of an economic elite has prevailed. Believing in the perpetuation of the power of this elite means underestimating the power of social pressure for change in this public space that can be built within the precepts of a participatory democracy.

The quest for greater democratization of the state and, consequently, of public administration is undoubtedly much more in the hands of organized civil society than of rulers. And Brazilian society has demonstrated this since the official period of slavery (1539–1888), when there was much denial of actions within the slavery system, in addition to resistance organized at the beginning of the formation of the Brazilian administrative system. In the same way, in the twentieth century, society organized itself to conquer the right to participate in the decision-making processes of public policies. However, it is notorious that an open political system and a public administration that institutionalizes its spaces of participation in public politics so that they work effectively makes all the difference and does not fail to reveal a political maturation of both parts, State and society. This is the model of public management that is expected in contemporary societies: more participation, more shared decision, and more social public policies.

## Definition

A set of structured methods to involve citizens in the process of allocating the public budget. Some scholars proposed the following defining criteria to identify a sensu stricto participatory budgeting: (i) the financial and/or budgetary dimension must be discussed; (ii) the city level or a district with an elected body has to be involved; (iii) it has to be a repeated process; (iv) it must include some forms of public deliberation within the framework of specific meetings and/or forums; (v) some accountability on the output is required; and (vi) the possible and desirable participation of lay citizens.

## Introduction: Citizen Involvement as a Key Factor in Government Renewal

In the increasing attention paid to PS renewal, special significance is attributed to the involvement of citizens in government. Many approaches consider CP as a distinguishing feature of new cultural paradigms, such as PG, through which the evolution of the PA can be interpreted (Bingham et al. 2005). CP can be broadly defined as an effective and informed opportunity for citizens to influence the choices and behavior of the PA. From this standpoint, the problem of the "intensity" and quality of participation depends on the role – and therefore the possibility of influence – that the individual citizen is able to play in the public decision-making process (Arnstein 1969).

CP is an issue that touches upon many disciplines and is a concept that can have diverse practical implications. The interpretation of participatory practices necessitates a particular focus on their goals and outcomes, which can be attributed to three different realms of meaning and application of CP.

A first key to understanding is political in nature, by which participation is seen as a value and an instrument in renewing systems of government. At the basis of this understanding of the concept, and the promotion of the theme, is the crisis in the traditional model of representative democracy typical of Western countries. In this sense, participation can be interpreted as an instrument capable of predisposing citizens to the idea of collectivity and sociality, in the aftermath of dissatisfaction with the democratic regime. Therefore, the traditional representative form has been gradually opposed to the participatory and deliberative – in its further extension – form. The underlying idea is that systems of government based on the pursuit of new collective decision-making methods are able to return to the authentic meaning of democracy.

A second perspective is of a more strictly social nature. CP can be interpreted as an instrument that brings people closer to the idea of community and sociability and combats feelings of dissatisfaction and alienation. Thereby, inclusion in decision-making processes can be considered a useful instrument in reconstructing a sense of community. More precisely, this practice has the potential to raise the extent to which values identify a community and the degree of convergence of the behavior of individual members. Consequently, CP can be seen as a foundation for rebuilding social capital, strengthening democratic governance, and facilitating sustainable community outcomes. In this light, the theme also involves that of the legitimization of power; indeed, measures that improve social cohesion and trust have an impact in terms of a community's acceptance of identification with the political institutions that represent it (Wampler 2012).

Another area of participatory significance is of a more administrative nature. This regards a technique capable of renewing and improving administrative performance in the PS, overcoming the limitations of the traditional conception of government, and also allowing for a correction of distortion produced by the managerialist wave of recent decades. The well-known cultural movement often called NPM began to take shape in the 1980s, promoting an international agenda for reform. More recently, another conceptual framework, generally known as PG, has come into vogue and is often seen to have overtaken NPM (Kooiman 1993). The limits of NPM include the fragmentation of the sector and the intensification of competition that result in detrimental effects for the "public ethos" (Brereton and Temple 1999). There are risks of aggravating the conflict between individual interests and the public interest with the consequence of eroding traditional social values (in particular legitimacy, representativeness, and equity) that should characterize government action.

In the attempt to overcome this, the PG approach tends to return to the bidirectionality of the relationship between PA and citizen, who is treated not as a mere customer, but as a partner (OECD 2001). This model is based on a logic of collaboration, by which the assistance of a number of parties satisfies public needs (Vigoda 2002). In this sense, CP is seen as a fundamental aspect of the shift from the "old public administration" to the "new public governance" (Osborne 2010). There are also other specific terms to express this concept such as collaborative governance, shared governance, and community governance.

## The Emergence and Spread of PB Around the World

In this frame a large number of different participatory tools have arisen with the aim of involving citizens in decision-making processes and public service provision. Among these practices PB deserves a special mention for its inclusive potentialities given the centrality of budgeting in public resource allocation. As Khan (1997: 93) said: "the budget would present to the citizens their government in miniature."

To understand PB one must first consider that it is not an instrument that was planned at the drawing board, but was developed through experience, and has emerged with a great degree of diversity. It is, as a result, difficult to provide a generally accepted theoretical definition. PB can be generally described as a set of structured methods with which to involve citizens in the process of allocating the public budget. Even today, despite having spread across the continents, with a variety of experiences that can be considered mature, it remains difficult to define the identifying features of an ideal form of PB.

Sintomer, who promoted and coordinated a relevant research project in order to map European praxis, suggested the following five criteria to identify PB (Sintomer et al. 2008):

1. The financial and/or budgetary dimension must be discussed.
2. The city level or a district with an elected body has to be involved (the neighborhood level is not enough).
3. It has to be a repeated process.
4. The process must include some forms of public deliberation within the framework of specific meetings/forums.
5. Some accountability on the output is required.

Later, other scholars (Bassoli 2012) proposed the effective possibility and desirability for lay citizens to participate as a sixth defining element.

Even the origins of PB are difficult to trace. On first estimate, three incubation areas can be identified, in which the first practical applications were established, which went on to become a source of inspiration for other experiences that followed.

New Zealand can be considered the home of one of the earliest PB experiences, and the example of Christchurch is of particular interest. This was one of the first towns to structure a method of citizen involvement during the drawing up of the annual budget and multiannual investment plan, with particular attention being paid to themes of transparency and reporting. For these reasons it

was awarded the "Carl Bertelsmann Prize for Democracy and Efficiency in Local Government" in 1993. In the Oceanic approach, participatory mechanisms were introduced specifically to improve PA performance and, it has been said, to correct the distortive effects of NPM, with particular attention paid to the crisis of trust, the result of an emphasis on managerial accountability at the expense of political accountability.

A second area of great interest is the experience that developed in South America. The most relevant case was implemented in Porto Alegre, Brazil. The Porto Alegre PB dates back to 1988 and was included among the UN good practices in 1996. Its fame has spread considerably, on a global scale, mainly thanks to the 2001 Social Forum, which attracted the attention of many experts, and is still considered a model of reference today. In brief, it can be said that, in comparison with the approach developed in the Western world, this approach to PB is characterized by a strong political and social motivation, as well as the use of participation mechanisms based on assemblies in order to reach a good quality of deliberation, and also by the binding nature of the participated decision for the governing bodies.

Finally, it is worth mentioning North America, where PB developed in the 1990s, thanks in part to the encouragement of institutions such as the American Society of Public Administration (ASPA) and the International City/County Management Association (ICMA). Generally speaking, it can be acknowledged that, in the first wave of North American cases, the aspiration to interact with citizens was determined, above all, by the need to recover the legitimacy of political action and reconstruct social cohesion (Franklin et al. 2009). It should be noted that the last few years have seen the introduction of new experiments in North America, mostly inspired by the Porto Alegre model. This second PB wave has also involved important cities such as Chicago, Los Angeles, and New York.

The process reached Europe in the 1990s, drawing inspiration from cases that had developed in other contexts. Only a handful of applications of PB were observed before 2000, while the last 15 years has seen PB become much more widespread across the Old Continent. According to the abovementioned survey promoted by Sintomer, 55 European experiences were registered in 2005 – but that number would increase rapidly – and the analysis of such cases showed how heterogeneous those practices were (Sintomer et al. 2005). These differences are mainly referred to the conception of CP that underlies the structuring of rounds of PB, the size of the institutions involved, their financial capacity, and the technical characteristics of the participatory process.

The multiplicity of this phenomenon does not only regard Europe, as evidenced by a subsequent survey undertaken on a global scale by the same research group. That survey (Sintomer et al. 2010: 10) included a census of cases active in 2010, which showed a total number of between 795 and 1,469 applications, with the greatest concentration in Latin America (between 511 and 920), followed by Europe (171–296) and Africa (66–110), continents where PB has developed more recently. It should be noted that, in addition to the technical challenges associated with carrying out a full census across the globe, the study was based on Sintomer's definition of PB, as outlined above; this involves strict identification criteria, the rigidity of which threatens to exclude cases which are nevertheless significant. The issue is, furthermore, very current, and the praxis indicates the continuous emergence of new applications.

## An Overview of PB: Main Features

In order to shed light on the main features of PB, despite the fact that there is no single model of reference, major themes can be identified that constitute a variety of profiles that are potentially characteristic of the individual experiences. The following is a concise overview.

### Form of PA Involved

As noted above, the first experiences of PB were promoted at the municipal level, and, even today, most of the cases analyzed in the literature involve local government. Applications are also not

uncommon at the sub-municipal (district or neighborhood) level, and there are also experiences at the provincial and regional levels. Implementation at the national level appears more difficult to achieve and therefore less likely.

In general it is believed that CP is more accessible and easier to manage when it involves small communities that are united by a strong sense of identity. Also for this reason, the preferred institutional profile is at the municipal level, above all in cities of smaller dimensions. That said, applications of PB have also been promoted in many large cities, as demonstrated by the iconic case of Porto Alegre.

Evidently the bigger the community of reference, the more detailed and complex the structuring of the participatory process needs to be; typically, in these cases, paths are chosen that involve territorial subdivisions or which take advantage of the possibilities offered by the development of technology.

### Promoters

In most cases studied to date, the path that leads to the adoption of PB is of the top-down variety. These are situations that involve a formal initiative on behalf of government bodies (the mayor, regional council, or one or more aldermen), with the possible sponsorship of another political entity (the council or a superordinate institutional body). The stimulus that can be provided by specific state or regional regulatory measures, or international institutions, should also be considered. There are, for example, PB projects promoted and financed by the World Bank and the European Union.

Another hypothesis is that of a genesis of a technical nature, due to the proactive role played by certain managers. It is worth noting that also in these cases, it is possible to hypothesize "patronage" of a political nature.

Less common, but no less notable, is the possibility of a bottom-up driving force, as a result of pressure from the citizenship. In such cases experiences in South America, Africa, and Asia document the importance of the action that can be performed by intermediate bodies (in particular by NGOs, but also citizen movements and associations).

The diverse origins of PB can also provide indications about the primary values (political, technical administrative, or social) that are pursued through its adoption.

### Types of Citizen Invited to Participate

The most prevalent concept of PB is open to all members of the community (generally voters), as individual citizens without qualified interests (known as lay citizens). However, it is also possible to consider inclusive processes aimed at specific categories of stakeholder, or the involvement of specially selected panels of citizens, or interaction with organized interest groups.

The theme of those to whom PB is addressed also calls into question the issue of the quantity and quality of CP, which will be discussed later.

### Participatory Structure

The heart of the PB cycle is represented by the mechanisms through which the co-decision is reached. There exist a vast range of possible instruments, and this praxis also signals the possibility that they can be combined together: referenda, assemblies, forums, focus groups, committees, technical committees, e-voting, etc.

Even given the vast influence of the Porto Alegre model (an experience that has however been modified over time), a central role is often played by assemblies. These meetings can be held to perform a variety of functions: to inform citizens, to summon and compare opinions in the context of a debate, to develop proposals, and to choose between options. Assemblies are often held at the sub-municipal territorial level, but thematic meetings according to subject categories are also possible. The assembly can involve one or more cycles. The classic structure is divided into two cycles: the first of a more informative nature, dealing with the emergence of needs, and the second with a focus on decision-making.

The procedures for conducting assemblies are a particular sensitive issue; they can be coordinated by political or technical figures at an institution, by citizens nominated to the role, or by external experts with a consultative role.

On occasion an assembly may appoint representatives who, on the basis of a defined mandate,

participate in technical bodies responsible for enforcing the wishes of the assembly.

### Themes of Co-decision

PB was created to enable citizens to express their opinions on concrete and precise choices, such as the planning of public works, to choose between alternative services to be delivered. However, the recent tendency toward broader issues and policy-making in deciding the annual budget is worth noting.

The experience witnessed in Brazil offers indications to that effect. On this topic Wampler (2000) distinguishes between two important eras of PB. In the initial phase, PB involved punctually defined themes. In particular, the first cases were characterized by their focus on needs and possible responses in the field of urban planning and public works in general. Subsequently, the focus has expanded to interventions concerning social services and health care, culture, sport, and the environment. In the second era, municipalities have opened up to experiments in which participation has mainly focused on social issues of broader scope, involving the definition of public policies. In this way orders of priority between different spending policies can be established.

Less common, but also of great interest, is the practice of widening the discussion to include the theme of taxation. Associating the co-decision on expenditure with the theme of how to cover these expenses can further empower citizens, as well as foster more effective solutions in the field of fiscal policy.

### Existence of a Preset Budget

It has already been noted that the prior clarification of resources intended for the realization of the co-decision is, at least for Sintomer, an essential requirement of PB. Indeed, without a clear connection with a specific part of the annual budget, PB risks resulting as a practice of consultation for the purpose of financial or investment planning.

When this requirement is complied with, the resources available for the co-decision may relate in part or in total to certain expenditure items of the budget (typically capital expenditures) or may consist of a fixed percentage of the total or some entries.

Recently public forms of fund-raising have also emerged, funded by the granting of tax concessions, to supplement the budget of resources made available by the authority.

### Level of Process Formalization

The institutionalization of PB by the PA that adopts it can be encouraged by a variety of formal interventions: statutory integration, the development of appropriate guidelines approved by government bodies, the creation of new administrative regulations or changes to preexisting guidelines, etc.

The formalization of PB can be viewed as a sign of the will of the institution to stabilize its use and encourage its internalization in the organization. On the other hand, there is a risk of rigidly formalizing a practice that often arises in a spontaneous manner and which requires continuous technical and organizational adjustments in order to remain flexible and creative. For these reasons, in the early stages, it is often preferable to maintain an organizational context that is not too restrictive, as the rules of the game must be clear and simple, in order to win the trust of the citizenship. At a later stage, it may become opportune to proceed with an appropriate formalization of the PB cycle.

### Process Reporting

The final stage of the PB cycle is normally represented by the reporting of the process, which guarantees a form of accountability for the community. The most frequent methods involve the publication of information through the corporate website of the authority, the local press, the distribution of brochures and other printed materials, and the organization of dedicated public hearings. On occasion the first assembly of the following cycle is used to discuss the results of the previous cycle. It can be observed that the information given often only regards the performance of the process that led to the co-decision while omitting information on issues regarding the implementation of the co-decided initiatives and their impact.

## Critical Issues

The above discussion, besides highlighting a plurality of options regarding the implementation of PB and the possible configuration of diverse modes of application, also allows for an understanding of some critical issues concerning this type of instrument. Above all, there are some issues of a general nature relating to all forms of inclusive practice. Reference is made, in particular, to the fact that CP:

- Is a concept of participation that, at least according to some (Sandercock 2005), is elusive by nature, as it is difficult to define and, above all, difficult to measure in its applications and effects.
- Lends itself easily to rhetorical use, which could be manipulated for other purposes, and, in any case, facilitates formal and ceremonial practices.
- Often involves costs and delays for the parties involved.
- Can have a negative influence on the accountability of the PA, altering the traditional vertical principal-agent relationship, creating potential conflict between participating citizens and those who are excluded (even if by their own choice).
- The type of relationship involved, which may involve substitution or complementarity, is not always clear. It may encompass the operation of traditional mechanisms of representation, founded on mediation between political parties, and the adoption of participatory mechanisms, in particular direct participation (such as PB).

There are also a number of critical issues that are specific to PB. Many studies have highlighted a pronounced instability in its application: often the use of PB does not last for more than a few years and, in other cases, undergoes continuous applicative modifications. Lopes Alves and Allegretti (2012) discuss the fragility and volatility of the phenomenon.

At times there is the issue of the over-identification of PB with the figure or political coalition that has promoted its use. This may create a dangerous connection between the political fortunes of the promoter and the fate of PB.

Another critical issue concerns the quantitative and qualitative profile of participation. Citizens are not always keen to be involved in PB. In many cases, the participation rate is well below the 5% threshold. Participation also entails a cost for the citizen, in terms of the dedication of time and energy, and does not provide for any form of remuneration; the potential benefits associated with participation are not immediate. It is also true that an accurate assessment of the quantitative levels of participation should take into account the effect of the proxies that citizens might implicitly assign, including family members, friends, and others in the same interest group.

From a qualitative standpoint, the possible influence of lobbies should be noted, as they are capable of conditioning the process of the formation of the co-decision in a negative manner. Often the citizens most eager to participate are those with an acute perception of their own needs. Thus the co-decision risks being the result of a process strongly influenced by those members most able to organize themselves in order to satisfy their own needs, casting doubt on the degree of universality.

These issues highlight the importance of some of preconditions necessary for the success of PB. It is necessary to verify and facilitate the existence of a variety of requirements of a socio-cultural, organizational, and financial nature.

With regard to the first typology, which refers to the characteristics of the community of reference, PB requires a sensitive and receptive environment. In this sense the presence of social networks rooted in the area (political movements, voluntary associations, NGOs, etc.) can be crucial. A significant role can also be played by the use of other existing practices and instruments of an inclusive nature. In general it is considered important to promote training initiatives that can educate the public to the potential and advantages of PB.

With reference to the second order of prerequisites, it is necessary for the institutional system and the organizational structure of the institution

that promote PB to enable an adequate "internalization." It is not uncommon to encounter internal resistance, often of a cultural nature: operators (public officials) have to be adequately prepared, in order to avoid formalistic and demagogic use of BP and the risk of conflict between the various parties involved in the management of the process.

Finally, there is the financial aspect to consider. Activating a cycle of PB can result in significant costs. Certain situations may benefit from financial incentives granted by higher-level or international institutions (such as the World Bank in some developing countries), but such conditions have a limited duration.

A sensitive issue, which particularly affects the quality of the co-decision, concerns the structuring of the process. In this regard it should be noted that the supporters of what is known as deliberative democracy do not look favorably on the spread of the instruments of e-democracy, as they prefer the assembly approach. From their point of view, a decision is not the result of the simple aggregation of the individual preferences expressed, but rather arises from dialectical processes that make it possible to reach a shared and responsible "collective will."

Furthermore, in some experiences this expression of the popular will has not been attributed a binding value by government bodies, as PB is treated as a praxis of informed debate and consultation, rather than a genuine co-decision.

## Conclusions

The need for the renewal of the PA and the spread of the paradigm of PG are contributing to a return of the theme of civic participation, which had been popular in the past. PB is considered to be one of the instruments with the greatest inclusive potential and, as a result, has seen a significant global dissemination.

Theoretical studies and empirical observations conducted to date indicate that there is a set of practices that present a greater degree of differentiation, although the widespread influence of the Porto Alegre model, at least in its original form, is to be recognized. The diversity between the experiences is a result of the choices made in the implementation of PB, decisions that concern certain aspects in particular: the identification of the recipients, attention to the external and internal preconditions necessary for the operation of participatory mechanisms, how these mechanisms are structured, the choice of themes, the clarification of a preset budget allocated for the co-decision, the degree to which the parties are willing to accept the co-decision as binding, the level of formalization of the process, and the reporting process.

The praxis has faced some critical issues, and the future of PB depends on the approach that will be taken to deal with them. Perhaps the element of greatest significance is the instability of the cases implemented, in terms of both fragility (a tendency for the experience not to be repeated) and volatility (sensitivity to change). Even the experience of Porto Alegre has undergone important change and today appears to have less support, prompting advocates of deliberative democracy to wonder if "a time of closure" has arrived (Melgar 2014: 121).

Therefore, the questions about the future of PB and the true significance of its diffusion remain pressing: is it an instrument that can truly influence the government conception of "public affairs," or is it just a passing fad? Are these initiatives aimed at reshaping the way democratic systems operate, or are they only promoted to acquire or legitimize political consensus in the short term or to accommodate the short-lived requests of pressure groups?

To attempt to answer these questions, it is necessary to examine and interpret the changes currently underway, in order to fully understand their significance. In doing so, particular attention should be paid to the relationship between the objectives for which PB is promoted, the manner in which PB is implemented, and the internal and external environment of reference (as a model that performs well in one context can be a failure in another). In the same way, other fields that require further attention are the perception of citizens (as there are still a limited number of studies on the subject) and the assessment of the impact produced, in both the short and medium term.

# Participatory Decentralization Reform, Peru

Stephanie L. McNulty
Franklin and Marshall College, Lancaster, PA, USA

## Introduction

In 2001, many Peruvians celebrated the potential for democracy and decentralization. A peaceful and democratic election had just taken place, bringing to power new leaders promising an end to the hyper-centralized and corrupt rule that had typified the previous era. Alberto Fujimori had resigned from his position as president of the nation in disgrace the previous year, after systematically concentrating power in the national executive branch and participating in webs of corruption that reached the highest levels of government. During this transition year, candidates for congress and the presidency promised to clean up government and devolve powers to local and regional governments.

After the congressional elections of 2001, newly elected national officials set to work reforming myriad broken political institutions. One of the most comprehensive reforms to leave congress was a decentralization reform, signed into law by the newly elected president, Alejandro Toledo, in 2002. Because the reform enhanced

subnational governments' power and resources, and also empowered citizens and civil society organizations to oversee their elected officials in unprecedented ways, it emerged as a "participatory decentralization process" (McNulty 2011). One of the important reform efforts in Peru's recent history, decentralization contributed to widespread optimism among political analysts and officials about the country's future.

Due to the nature of this publication, this entry cannot discuss all of the nuances inherent in this complex and evolving process, nor can it include the large literature written about the process (see, e.g., Carranza Ugarte and Tuesta Cárdenas 2004; Controlaría General de la República 2014; Estrada Pérez 2008; McNulty 2011; Prodescentralización 2011, 2015; Zas Friz Burga 2004). It does, however, highlight many of the most important aspects. This brief piece outlines the history of decentralization in Peru as well as the specific legal framework that has emerged since 2002. The final section documents how the implementation of the reform has evolved, noting that the process has hit many roadblocks. Without meaningful support from the government's highest officials, the reform may never live up to its potential.

## The History of Decentralization in Peru

Peru's 2002 participatory decentralization reform emerged after a long history of centralized rule with power and resources concentrated in its capital Lima, punctuated by efforts to decentralize administrative structures to municipal, provincial, and regional governments. Like most Latin American countries, the Spanish colonial system centralized power, and during most of Peru's republican history the oligarchy and the country's economic system reinforced this system. Before the mid-twentieth century, there had been some attempts to decentralize administrative powers; however, these generally failed. Almost every Peruvian constitution has made some formal nod to the importance of a decentralized state, yet the most prominent efforts to codify this process have taken place in the latter part of the twentieth century. Since 1979, the constitution has maintained that the state should be "unitary, representative, and decentralized" and makes at least passing reference to regional and local governments. In 1979, as part of the transition to democracy, the Constitutional Assembly formally set up regional and local governments in the new constitution. However, there was very little movement toward setting up these governments until the late 1980s.

A push to move decentralization forward took place under Alan García's first administration (1985–1990). Regional governments were set up through Law 24,650, and elections were held between 1989 and 1990. This represents the first time that both regional and municipal governments were democratically elected. The combined legal package that emerged from 1979 through the end of the García administration set up a parliamentary system with a regional assembly, a regional council, and a president. Regions held assembly elections, and then the assembly members elected the regional presidents and vice presidents. The assembly consisted of directly elected officials (not to exceed 40% of the body), provincial mayors (who were also elected in a separate election), and representatives of civil society organizations (CSOs), primarily social and cultural institutions (not to exceed 30% and in proportion to the rural population of each region). The foundation for the current participatory reform was laid when civil society organizations were given formal positions in the regional assemblies. Representatives from social organizations – including *campesino*, agricultural, university, cultural, professional, neighborhood, parent, and women's organizations – elected the civil society representatives for the assembly.

Widely recognized as an extremely problematic reform (McNulty 2011; Zas Friz Burga 2004), this initial effort was cut short when Alberto Fujimori shut down his own government in 1992 in what is called his "self-coup" (*auto-golpe*). This included closing down the regional governments and replacing them with seven-member *Consejos Transitorios Administrativos Regionales* (CTARs), or Transitory Regional Administration Councils. The CTAR members, appointed by Fujimori,

reported directly to the President's Council of Ministers. Municipal governments also suffered under his regime, especially those led by members of opposition political parties. A new constitution, passed in 1993, institutionalized a more powerful executive, and Lima continued to be the hub of almost all political and economic activity.

During Fujimori's decade-long rule, direct citizen participation, on the other hand, was allowed to expand in new ways. The Citizen Participation Law (Law 26,300), passed in 1993, stipulates that citizens are legally allowed to initiate referenda and recall officials at the local level. Several local initiatives emerged to encourage citizen participation as well. Community roundtables, called *Mesas de Concertación* (hereafter referred to as *mesas*), sprang up in several municipalities around the country. The *mesas* brought together representatives from the government and civil society in a formal space to discuss and come to agreement, or *concertar*, on community issues. Further, means of local participatory planning, such as developing strategic plans and experimenting with participatory budgeting (PB), became more prevalent. Several communities, such as Villa El Salvador and Ilo, had interesting experiences with participatory planning that were taking place completely independent of the central government. These were emerging in Peru at the same time that participatory governance methods were becoming more prominent around Latin America. Thus, while the macro-political context was stressing the concentration of power in the central government, several local experiences with citizen participation in governance were taking place around the country.

Toward the end of the Fujimori regime, therefore, it is not surprising that social movements around the country began to push for renewed decentralization and increased citizen participation. As allegations of electoral manipulation, corruption, and drug trafficking increased, calls to reform Peru's political system grew louder. When Fujimori stepped down, politicians promised to undertake major reforms that would devolve powers to subnational governments and improve transparency and accountability.

## Legal Framework

These promises were realized in the 2002 decentralization reform framework. The first step lay in reforming the 1993 Constitution to set up several levels of subnational government – while maintaining Peru's unitary state – with new powers that would be devolved over time in four overlapping phases. The constitutional reform also sets out several participatory mechanisms, such as regional and local coordination councils, participatory development planning, and participatory budgeting.

The decentralization reform empowered several existing levels of government – departmental, provincial, and district (or municipal) – and collapses them into two administrative categories: regional (the former departments) and local (provinces and district/municipal) levels of government. As the map below, (map produced by the US Central Intelligence Agency and available at http://www.lib.utexas.edu/maps/peru.html) illustrates, the reform created 25 regional governments (the 24 original departments and one "special region," the Province of Callao). With the exception of Callao, each region has a capital city and elected regional officials (a governor and a regional legislative "council"). Each region has several provinces (as of 2014, according to Law 30,186 a total of 196 in Peru), which also have elected mayors and legislative councils. Finally, the reform gave additional powers to district governments, which existed prior to the reform but were relatively weak. As of the end of 2015, there were 1,867 districts in Peru. The original intent of the reform was to create another level of government, "macro-regions," which would consist of several regions that would decide to unite under one administrative umbrella. Reformers strongly believed that 25 first-order administrative units would be too unwieldy to govern.

At the same time, reformers knew that subnational governments would need additional finances. Previous to the constitutional reform, in 2001, Congress had passed the Canon Law (27,506), which governs mining and gas royalties by outlining how the resources should be allocated to the different levels of government

(Crabtree 2014). The canon has given some regions and districts much more resources to finance infrastructure projects than others and has resulted in a pattern of unequal distribution of resources in subnational governments (Crabtree 2014).

After amending the constitution, Congress then passed a General Decentralization Law (Law 27,783). In addition to outlining the objectives of decentralization, the powers of each level of government (national, regional, and local), and a general framework of each government's functions or powers (called *competencias*), it creates the National Decentralization Council (Consejo Nacional de Descentralización, or CND), accountable to the president, to implement and oversee the decentralization process. Chapters Four and Five of the law set out several mechanisms of citizen participation, such as development planning and participatory budgeting.

To specify details regarding the regional and municipal levels of government, Congress then passed the Organic Regional Government Law (Law 27,867) and Organic Municipal Government Law (Law 27,972) to clarify even more the decentralization process and the mechanisms through which citizens and civil society organizations will participate in public policy decisions and oversee their elected officials. Another important piece of the legislation is the Organic Executive Power Law (29,158) passed in 2007, which regulates the decentralization of the executive branch. Of course, since 2007, hundreds of new decrees, instructions, and laws have been passed to continue to clarify and adapt the process as it unfolds. An organization called Prodescentralización publishes annual reports on decentralization that include updates on all major legislation passed in chronological order (see http://prodescentralizacion.org.pe/publicaciones/).

The reform was expected to unfold in four overlapping phases. The first phase set up 25 political regions based on the already existing departments in Peru. The second phase called for a referendum – held on October 30, 2005 – to set up macro-regions that combine several regions into one political entity. At the same time, the third and fourth phases consisted of the transfer of several powers to the local and regional governments. The phases stalled when no region successfully formed a macro-region, and the referendum failed. Since then, two regional groupings and more than 170 municipal groupings (called "*mancomunidades*") have formally been set up to encourage integration between administrative units (Prodescentralización 2015). However, the idea of macro-regions has never been revived.

While participatory institutions are set up in many sectors of these governments, two particular institutions are worth mention. The legal framework mandates that regional and local governments elect "coordination councils," as outlined in Laws 27,680, 27,902, and 27,972. As a result, Local Coordination Councils, or *Consejos de Coordinación Locales* (CCLs), and Regional Coordination Councils, or *Consejos de Coordinación Regionales* (CCRs), exist in every subnational governmental body. These councils are formally part of every subnational government's structure and operate parallel to municipal, provincial, and regional councils (the legislative councils mentioned earlier). CCLs and CCRs are tasked with coordinating between the different levels of government and providing civil society organizations a formal role in government. CCLs and CCRs are made up of mayors from the provinces or districts that make up the particular council's area, as well as members of civil society organizations. The members of civil society organizations are chosen in a special election, organized by the particular subnational government, held every 2 years. To run for these positions, civil society organizations that are properly registered in the locality can send a representative to participate in the election and then vote. The Peruvian legislation calls for the councils to meet four times a year to discuss development and budget priorities.

Another important aspect of Peru's reform is the Participatory Budgeting Law (Law 28,056) passed in 2003. Participatory budgets devolve decision-making authority to new actors, who debate and vote on what projects to fund. For the first time in history, Latin American national government officials mandated that participatory budgeting must take place in every subnational government on an annual basis. This law dictates

that the capital investment costs of each regional, provincial, and local budget must be developed with civil society input. Following a series of steps – developed by the Ministry of Economy and Finance – subnational governments must demonstrate that they have complied with this process in order to receive their annual budgets.

Law 29,298, which modifies the original Participatory Budgeting Law, outlines the four phases for the PB process, which should take place annually:

1. Preparation, or identifying, registering, and training participating agents.
2. "Concertation": During this phase, the participating agents meet to discuss the region's development plan and prioritize the "themes" of projects that should be funded in the new budget. A technical team then evaluates each proposed project and, based on the agreed upon priorities, recommends the projects that should be funded.
3. Coordination among the different levels of government, which consists of meetings between the regional president and the local mayors, to make sure that spending is coordinated, is sustainable, and has regional impact.
4. Formalization of investment projects. This takes place during a regional meeting where all participating agents are given a vote in the final project list. This final list is sent to two regional governmental bodies, the Regional Coordination Council and the Regional Council, for approval.

In sum, in a few short years, Peruvians finalized a legal framework for a radical and comprehensive participatory decentralization process. The laws lay out a detailed process that should have unfolded in relatively neat phases. However, in practice, the process continued to unfold in fits and starts.

## The Evolution of Peru's Decentralization Process, 2002–2015

With the bulk of the legal framework finalized, Peruvians set to work to implement the reform. In 2002, regional government elections were held, and, since then, subnational governmental elections have taken place regularly and without hitch. Regional political parties have gained strength over time, and many of them now hold national political positions.

Other aspects of the reform have not unfolded as smoothly. In 2005, the referendum to form macro-regions failed. During that same time period, the process of transferring powers to regional governments took place in a problematic and slow way, partly due to problems with accrediting the regional governments to receive their new powers. From 2004 to 2006, the national government produced annual "Transfer Plans," which determined which functions to transfer. In accordance with the 2004 Law of the Accreditation System for Local and Regional Governments (Law 28,273), the CND would accredit a region as ready to receive the function. The process has been criticized as being formalistic and lacking follow-through, as no technical assistance or additional resources accompanied the process (Controlaría General de la República 2014). As of June 2006, only 91 of the 185 new regional powers had been transferred from the national to the regional governments (Controlaría General de la República 2014).

The reform process took on new strength when Alan García took office in 2006. He quickly moved to undertake what he called a "decentralization shock" program. The program consisted of 20 steps to push decentralization forward, most of which worked toward speeding up the transfer of powers to subnational governments. García promised to finalize the transfer of the remaining regional government functions by the end of 2007, for example. The program also made the accrediting process more flexible, and by December 2012, 92.6% of the regional government functions had been transferred (Controlaría General de la República 2014).

The García government also restructured the national coordination process by replacing the CND, which had been at the same level as a national ministry, with a new coordinating technical entity, the National Decentralization Secretary, or Secretaría de Descentralización (SD).

The SD reports to the General Secretary of the President's Council of Ministers. While politicians argued that this would improve the functioning of the coordinating body, others argued that, in effect, the national coordinating office had been demoted within the national government structure.

When García left office in 2011, the new administration led by Ollanta Humala inherited a complex situation in which regional and local governments had taken on many new functions but did not have the institutional capacity, human resources, or budgets to implement them effectively (ANGR 2014; Controlaría General de la República 2014). There are also serious problems with interinstitutional coordination, as the different levels of government struggle to sort out the hundreds of functions and powers that often overlap (Muñoz 2014). Critics also charge that the SD, in its less powerful position, has not provided the leadership and oversight needed to effectively move decentralization forward. There is also widespread sentiment that the subnational governments are plagued with corruption and are not meeting the citizens' demands in an effective way (ANGR 2014).

Overall, the citizen participation mechanisms have had mixed results. The CCRs and the CCLs never became institutionalized in the subnational government structure and do not serve an important role in subnational governance. This is partly due to the fact that they are consultative mechanisms and do not have power to make binding decisions (McNulty 2011, 2013; Prodescentralización 2015). Participatory budgeting, on the other hand, is largely institutionalized around the country, and estimates suggest that almost every region, province, and district holds annual meetings to discuss and vote on budgeting priorities with citizen groups (McNulty 2012). However, in many places, the process has taken on a formalistic nature (López Ricci 2014; Prodescentralización 2015). Critics argue that the subnational governments hold participatory budgeting meeting but do not encourage widespread, inclusive, and meaningful participation (López Ricci 2014; McNulty 2015). And, many governments do not execute the infrastructure projects for which citizen groups have voted (Montecinos 2014). Thus, although the process takes place annually in all subnational governments, it is not always high quality.

## Conclusion

The current state of decentralization, therefore, is in flux in Peru. On the one hand, indicators show that the reform is institutionalized and reversing it would be extremely difficult. For example, public investments at the local and regional levels increased substantially during the 2007–2013 period. Municipal public investment budgets went from $2,214,000,000 to $7,179,000,000. Regional public investments also increased significantly, going from $1,500,000,000USD to $3,036,000,000USD (Guerra García 2015). On the other hand, municipalities vary greatly in their ability to execute infrastructure projects (Loayza et al. 2014). Analysts worry that there is not high-level political commitment to improve the myriad shortcomings of the process. A sign of this problem is the recent recentralization of the national budget under the current administration, during which a previous trend of increased budgets destined to subnational governments has recently been reversed (see Table 1).

Two additional problems plague subnational governments. First, over the past decade, social conflicts – mostly surrounding the extraction industry – have increased greatly around the country, many of them regional (not national) in nature (see Arce 2014; Arellano-Yanguas 2011a, b; Bland and Chirinos 2014; Jaskoski 2012; Ponce and McClintock 2014). This has put pressure on subnational governments, especially regional officials, to mediate and resolve complicated conflicts that often turn deadly. Further, as the commodities boom slows down, analysts worry that conflict might increase even more (Baca and Ávila 2015). Second, since the decentralization reform, citizens perceive that very high levels of corruption exist in subnational governments (ANGR 2014; Carrion et al. 2015). This strong perception of corruption among public officials in all levels of government ultimately serves to discredit public officials in the

**Participatory Decentralization Reform, Peru, Fig. 1** Map of Peru http://www.lib.utexas.edu/maps/peru.html

eyes of the citizenry, including regional and municipal officials (Carrion et al. 2015).

In closing, it is not clear how decentralization will continue to unfold in Peru. A new government has come to power, and the future of the reform depends on the commitment of that administration to tackle problems such as widespread corruption and the lack of institutional capacity, human resources, and budgets in the subnational governments. A renewed emphasis on the value of

**Participatory Decentralization Reform, Peru, Table 1** Percent of Total National Projected Budget (The Peruvian government tracks the "original" budget (called Presupuesto Institucional de Aperatura), which is the projected budget that is approved for each level of government during the previous fiscal year, and the modified budget (Presupuesto Institucional Modificado), which is the finalized version by the middle of the budget year)

| Government level | 2004 | 2008 | 2015 |
|---|---|---|---|
| National | 77 | 68 | 73 |
| Regional | 15 | 17 | 15 |
| Local | 8 | 15 | 12 |
| Total | 100 | 100 | 100 |

meaningful citizen participation will also be needed to revive the participatory mechanisms that were enshrined in the legal framework by Congress. Without these changes, Peru's participatory decentralization reform will go down in history as one of the most ambitious reforms on paper, but not in practice.

### Synonyms

Citizen empowerment; Citizen engagement; Citizen involvement; Citizen-centered governance; Co-governance; Democratic governance; Participatory policy making

### Definition

"Participatory governance" widely refers to the democratic mechanisms which are intended to involve citizens in public policy-making processes. In other words, participatory governance is aimed at establishing a bridge between public institutions and ordinary people, in an attempt to increase the effectiveness and responsiveness of public policy-making activities. Either an interest-based, integrative, or functional logic may inspire participatory governance initiatives. Apart from the inner logic at the basis of these initiatives, the attempt to give a deliberative power to people distinguishes participatory governance.

### Introduction

At the beginning of the third millennium, a gradual shift from democratic government to participatory governance has been figured out by the scientific literature (Gbikpi and Grote 2002). However, still little is known – both in conceptual and empirical terms – about the distinguishing attributes which could be argued to characterize participatory governance initiatives. As well, it is not clear how citizens' involvement in effective policy making could be factually realized. Drawing on these considerations, it is not surprising that different perspectives have been embraced by scholars and practitioners to unravel the ultimate meaning of participatory governance.

Gustafson and Hertting (2016) pointed out that three different notions of citizen participation may typify participatory governance initiatives. Sticking to an interest-based logic, citizens are argued to accept to participate in participatory governance initiatives in order to protect and promote their own interest. Embracing such a perspective, participatory governance arrangement is understood as an opportunity to articulate the interests of specific groups of the community in the political arena. In a quite different way, the deliberative logic relies on the assumption that ordinary people are primarily interested in participatory governance initiatives to contribute to the establishment of a political arena for reasoning together. Within this arena, they are able to integrate the partial and context-specific perspectives usually embraced by public sector organizations with their own points of view. Therefore, as compared with the interest-based logic, an integrative approach is adopted, which paves the way for a contamination of the traditional perspectives that inspire public policy-making processes. Lastly, adopting a functional logic, participatory governance initiatives are intended to enable citizens and to make them aware of their coproducing potential in solving important societal problems. Obviously, ordinary people should be empowered and be willing to deal with public policy issues.

Regardless of the underlying logic inspiring participatory governance initiatives, it is possible to identify several recurring attributes, which are symptomatic of citizens' involvement in public policy making (Fung and Wright 2001): (1) a focus on specific social and/or political issues, which legitimize the implementation of participatory governance; (2) the engagement of ordinary people in decision-making processes, who are either directly or indirectly concerned by the

issues dealt with; and (3) the deliberative development of targeted solutions to handle social and/or political issues. Since these three attributes could be retrieved in various institutional arrangements which are aimed at fostering citizen engagement in public policy making – such as citizen-centered governance, democratic governance, and co-governance – it is convenient to briefly mark the boundaries between these different constructs, in an attempt to better define the attributes of participatory governance.

## State of the Art: Marking the Boundaries of Participatory Governance

Even though the involvement of citizens in public policy making could be currently depicted as a buzzword, it is not easy to provide a comprehensive definition of participatory governance. Indeed, this concept may evoke different meanings to varying audiences. Therefore, to shed light on participatory governance, it is crucial to outline the differences between this construct and its correlates.

Although relying on citizens' participation, citizen-centered governance maintains the leading role of public sector organizations in shaping public policies. Public policy making is molded according to the specific needs of the population served, which is involved in informing this process (Crawford and Walters 2013). In this circumstance, a limited degree of citizens' involvement is realized, which is ultimately intended to better inform the traditional decision-making processes accomplished by public institutions.

Democratic governance is peculiar in that it entails a greater degree of citizens' engagement in public governance. It could be argued that the main purpose of democratic governance is to increase the legitimacy of public policies through the consultation of ordinary people, rather than to empower and enable them to factually participate in decision-making processes (Franck 1992). From this point of view, democratic governance does not challenge the traditional state-centered policy-making process, even though it emphasizes the need for a greater citizen involvement in the political arena.

As confronted with the previous approaches, co-governance has been generally depicted as a particular shade of coproduction in the public realm. Indeed, it involves the establishment of a cocreating partnership between the citizens and the public sector organizations, which is intended to increase the latter responsiveness and effectiveness (Ackerman 2013). In spite of these considerations, co-governance focuses on decision-making processes, which are related to public services' design and delivery, rather than on policy-making activities (Somerville and Haines 2008).

If contrasted with citizen-centered governance, democratic governance, and co-governance, participative governance is a form of deliberative empowerment of the citizens, who have the opportunity to establish a renewed and enhanced relationship with the policy maker (Fischer 2006). Rather than performing as mere recipient of public services, citizens are enabled to actively participate in the public policy-making activities, gaining an increased control over the deliberation practices concerning the different government levels with which they interact. Beyond providing the citizens with the right to exercise voice, participatory governance allows them to have a significant role in public policy decisions, which produce tangible changes in their everyday life. It is worth noting that these participatory initiatives are not fragmented: rather, they involve the citizens in an ongoing dialogue with the public sector organizations, which paves the way for the creation of a unique joint value (McNulty and Wampler 2015).

In sum, participatory governance initiatives could be conceptualized as a partnership which is established between the ordinary people and the public institutions, which is intended to improve the quality and the effectiveness of public decision-making processes. In turn, the establishment of such a partnership relies on three building blocks: (1) the equal importance of each participant in addressing and influencing policy-making activities, (2) the need for a binding social capital based on a common vision and understandings, and (3) the leading role of a focal public institution, conceived as a senior partner in

implementing participatory governance initiatives (Walker and Shannon 2011).

Drawing on these considerations, several points to implement effective participatory governance could be figured out (Gaventa 2002). The establishment of a renewed and cocreating relationship between public institutions and ordinary people is a precondition of citizens' involvement in public policy making. For this purpose, both public institutions and ordinary people should be empowered, in order to increase their cocreating potential. The introduction of tailored and friendly mechanism to factually realize citizens' participation in public decision-making processes is required to fully realize the potential of participatory governance. Lastly, specific agreements intended to minimize the risks of poor outcomes associated with participatory governance initiatives should be arranged to shrink the institutional barriers to citizens' engagement. These points inspire the process of participatory governance institutionalization, which is discussed below.

## Future Perspectives

### Institutionalizing Participatory Governance

Participatory governance reforms are gaining a growing relevance in both developed and developing countries. However, it is still not clear whether a participatory approach to public policy making supports or endangers the proper functioning of public institution; besides, only limited evidence on the ability of participatory governance initiatives to enhance the democracy and the effectiveness of public policy-making processes is available (Lindgren and Persson 2011). The lack of an unanimous understanding about the consequences of participatory governance initiatives is – in part – produced by a variety of approaches which could be taken in order to involve citizens in public policy making.

Drawing on Speer (2012), it is possible to identify four main interpretations which may influence the implementation of participatory governance initiatives. First of all, participatory governance could be conceived as an attempt to realize a gradual process of democratic decentralization, which recognizes the critical role of citizens in shaping public policies. Public institutions' accountability and responsiveness are the main targets of participatory governance initiatives. However, this kind of interventions generally focuses on the enhancement of public sector organizations' legitimacy, rather than on citizen empowerment.

Differently, a deliberative democracy approach relies on the assumption that participatory governance interventions create appropriate spaces to explicit and aggregate the heterogeneous preferences of citizens, engaging them in a direct and cocreating partnership with public institutions. The main purpose attached to citizens' involvement is to make public policy-making processes more democratic and responsive, enabling ordinary people to actively participate in shaping public policies. From this point of view, the enhancement of the quality and the effectiveness of public decision-making basically inspires the interpretation of participatory governance initiatives as deliberative democracy approaches.

It is worth noting that deliberative democracy assumes that all citizens are able and willing to play a role in public decision-making processes. However, this is not necessarily the case when the disadvantaged classes of the population are concerned. An empowerment approach to the institutionalization of participatory governance initiatives recognizes the need for enabling the citizens, in an attempt to encourage their involvement in public decision-making. In this specific circumstance, participatory governance primarily aims at enhancing the citizenship of ordinary people, shrinking the social and institutional barriers to citizen involvement.

Lastly, a self-governance approach entails a full-fledged empowerment of citizens, who turn out to be able to deeply contribute in codesigning and co-implementing tailored solutions to increase the effectiveness and the quality of public decision-making processes. On the one hand, ordinary people benefit from an increased engagement in policy making, being able to express their perspectives and their needs in the political arena; on the other hand, public institutions have the opportunity to increase their resilience, as well

as their adaptiveness, opening their boundaries and awakening the dormant assets of citizens to improve public policy-making processes.

In most of the cases, the institutionalization of participatory governance follows a life cycle, which starts with a democratic decentralization approach and tends toward a self-governance approach. From this standpoint, participative governance itself engenders the development of a collective identity among the different actors involved in the public policy arena, which in turn paves the way for an increased involvement of ordinary people in public governance. While an instrumental perspective characterizes the initial phases of participatory governance, a transformative approach arises later, conceiving ordinary people as critical value cocreators in shaping public policies (Hordijk et al. 2015).

## Implementing Participatory Governance

Different instruments and tools may be used to realize participatory governance initiatives. Of course, the attributes of these tools rely on the specific purposes which are attached to participatory governance. When an instrumental interpretation of citizen involvement prevails, the main tool used to implement participatory governance is the activation of a one-way communication flow, which allows to establish a unilateral link between public institutions and citizens. Different channels may be used, including print information materials, audio and video media, and web-based information tools (Soomro et al. 2016).

Obviously, one-way communication is not enough when a transformative approach is embraced. Actually, to foster the engagement of ordinary people in public policy making, two-way communication tools are needed. Among others, opinion pools, public hearings, meetings, focus groups, and similar approaches establish a ground for common reasoning between the citizens and public institutions, thus paving the way for deliberative governance, where ordinary people are able to express their contribution to public decision-making activities (Gordon et al. 2017).

The implementation of self-governance requires deeper and more pervasive communication tools. In this circumstance, the enablement of the citizens' dormant assets and the encouragement of their active participation in public policy making are required to realize the full potential of participatory governance initiatives. As argued by Hordijk et al. (2015), round tables and councils which gather both ordinary people and representatives of public institutions are crucial to foster the establishment of a cocreating relationship between them to mold public policies.

## The Dark Side of Participatory Governance

Participatory governance is not free from criticism. The lack of empirical data about the value added of participatory governance initiatives does not help in pointing out the potential benefits which could be obtained from involving ordinary people in public policy making. As pointed out by Speer (2012), it is likely that the impacts produced by participatory governance are affected by the specific stage of public service provision to which it is attached. For the sake of the argument, it is possible that participatory governance may be effective during the planning and the design of public services, contributing to improve the responsiveness of public sector organizations; alternatively, it could be dangerous when the delivery of public services is concerned, producing increased risks of discrimination in the access to public services.

Also, it is worth noting that participatory governance may be used as a window-dressing strategy by public sector organizations, which is ultimately unable to challenge the existing power structures and to realize a factual citizen empowerment. From this point of view, it has been pointed out that participatory governance could pave the way for a new tyranny (Cooke and Kothari 2001), especially if ordinary people are not motivated to participate in public policy-making activities. To minimize this risk, participatory governance initiatives should be supported by tailored interventions intended to empower citizens, in order to awaken their dormant assets and to enable their involvement in public decision-making processes.

Of course, this makes participatory governance initiatives particularly expensive in terms

of time and resources. In the current period of economic and financial distress which affect public sector organizations, it could be difficult to afford the implementation of full-fledged participatory governance interventions. To overcome this barrier, it is crucial to foster the development of a stronger social capital within the community through bottom-up mobilization, in an attempt to enhance the individual commitment to the cocreation of public value and realize the full potential of participatory governance (Silver et al. 2010).

## Conclusions

Participatory governance is being promoted in different context to increase the engagement of ordinary people in public policy-making process and in broader processes of public value cocreation. However, there is still little agreement on the meaning of participatory governance. Further research should be aimed at providing a full-fledged understanding of participatory governance structures and instruments, in order to provide both scholars and practitioners with adequate insights to deal with the involvement of ordinary people in policy-making processes. As well, the *pros* and *cons* of participatory governance should be examined in depth to better comprehend the benefits and side effects of citizens' involvement. Last but not least, there is a significant need for empirical studies intended to push forward the knowledge about the best practices of participatory governance.

# Partnerships and Network Governance for United Nations Sustainable Development Goals (SDGs)

Naim Kapucu and Sean Beaudet
School of Public Administration, University of Central Florida, Orlando, FL, USA

## Synonyms

Action plans; Implementation; Networks; Partnerships; Sustainable Development Goals

## Definition

| | |
|---|---|
| Partnership | Collaborating with other levels of government and third-party organizations. |
| Sustainable Development Goals | Measurable 17 UN goals to achieve economic, environmental, and social sustainability. |
| Implementation | Action plans to realize public policy goals. |

## Introduction

The entry provides a brief background on the United Nations Sustainable Development Goals (SDGs) and the role of partnerships in the implementation of the goals. In addition, relevant policies in the United States and three examples from the state of Florida are briefly discussed, with a special focus on food, energy, water (FEW), and how these resources are interdependent and be integrated when making decisions to form the FEW nexus.

Past decades of inequality, environmental degradation, and economic disparity have led to the realization that such actions are undesirable and unsustainable. In response to the threats, the United Nations (U.N.) and Member States have worked for decades to overcome these issues and recently created actions and benchmarks in 2015 known as the Sustainable Development Goals (SDGs). The concept of sustainable development encapsulates three components – economic, social, and environmental – through a balanced and integrated approach (United Nations 2015). When drafting the SDGs, the United Nations incorporated the three components of sustainable development throughout the goals and also recognized the placed attention on the critical role that partnerships have played and would need to continue to play in the implementation and ultimate realization of the goals.

In implementing the SDGs, the U.N. acts as the global coordinator through internal divisions and associated global agencies. Yet simultaneously relies on individual countries to implement strategies and initiatives to reach the SDGs, which also involves the use of partnerships. To provide evidence, examples are provided from the United States. In addition, many of the SDGs are connected to each, as are the natural and human-dependent resources of food, energy, and water (FEW). As a result of this interconnection, the concept of FEW nexus is introduced and how this process could be achieved in cities and urban areas.

## Sustainable Development Goals (SDGs)

Sustainable development has been a growing global approach to combat previous decades of inequality, environmental degradation, and economic disparity. The modern definition of sustainable development can be traced to the 1980s and the core concept is to meet the current needs of society without jeopardizing the needs of future generations. Thereafter, the Millennium Development Goals (MDGs) were developed in 2000 to overcome many societal issues (i.e., poverty, gender equality, reducing childhood mortality) through global partnerships. The MDGs set targets to be met by the year 2015.

Prior to the expiration of the MDGs, all member states of the United Nations (U.N.) adopted the 2030 Agenda for Sustainable Development in 2015. The primary intention of the agenda was to improve the lives of individuals across the globe

while also protecting the environment through sustainable development. Sustainable development is based on three pillars or sectors – economic, environment, and social.

This is the latest global effort to work towards sustainable development. The 2030 Agenda for Sustainable Development created 17 goals listed below in Table 1. Collectively, the goals encompass the three previously mentioned pillars or sectors of sustainable development. Within each goal, there are multiple indicators (169 total). The indicators provide numerical measurements for countries to gauge their progress in meeting each of the goals.

## Partnerships

The last goal of SDGs, 17-Partnerships, recognizes that the achievement of the other goals and entire agenda will require partnerships between governments, the private sector, nonprofit organizations, and civil society (Kapucu and Hu 2020). In addition, partnerships are necessary at the global, national, regional, and local levels.

In the opening sections of the document of the agenda that created the SDGs, *Transforming our world: the 2030 Agenda for Sustainable Development,* it is mentioned that collective action is needed with stakeholders, or interested and

**Partnerships and Network Governance for United Nations Sustainable Development Goals (SDGs), Table 1** UN sustainable development goals (SDGs) (United Nations 2019)

| Number | Goal | Description |
|---|---|---|
| 1 | No poverty | Reduce the proportion of men, women and children of all ages living in poverty |
| 2 | Zero hunger | End hunger and ensure access by all people, to safe, nutritious, and sufficient food all year round |
| 3 | Good health and well-being | Reduce the number of health-related issues and deaths caused by diseases, substance abuse, traffic accidents, pollution, and other factors |
| 4 | Quality education | Meet education minimum targets for children and adults; additional funding for education facilities; increase number of educators |
| 5 | Gender equality | End all forms of discrimination and violence against women |
| 6 | Clean water and sanitation | Achieve universal access to safe and affordable drinking water and sanitation |
| 7 | Affordable and clean energy | Ensure universal access to affordable, reliable, and modern energy services |
| 8 | Decent work and economic growth | Promote inclusive and sustainable economic growth, employment, and decent work for all |
| 9 | Industry, innovation, and infrastructure | Build resilient infrastructure, promote sustainable industrialization, and foster innovation |
| 10 | Reduced inequalities | Policies should be universal in principle, paying attention to the needs of disadvantaged and marginalized populations |
| 11 | Sustainable cities and communities | Make cities inclusive, safe, resilient, and sustainable |
| 12 | Responsible production and consumption | Promoting resource and energy efficiency, sustainable infrastructure, and providing access to basic services, green and decent jobs, and a better quality of life for all |
| 13 | Climate action | Take urgent action to combat climate change and its impacts |
| 14 | Life below water | Conserve and sustainably use the oceans, seas, and marine resources |
| 15 | Life on land | Sustainably manage forests, combat desertification, halt and reverse land degradation, and halt biodiversity loss |
| 16 | Peace, justice, and strong institutions | More efficient and transparent regulations put in place; comprehensive, realistic government budgets to combat corruption |
| 17 | Partnerships for the goals | Sustainable development agenda requires partnerships between governments, the private sector and civil society; needed at the global, regional, national, and local level |

affected parties, forming partnerships to ensure that "no one is left behind" (United Nations 2015). The idea behind partnerships is that it allows many individuals, groups, or organizations to work together to achieve a goal that they would not be able to if they acted alone or in isolation. Additionally, it brings together individuals with different knowledge, skills, resources, and ideas that can potentially create better solutions. Thus, the engagement and participation of by stakeholders is very important and can ultimately lead to the success of a project(s) (Berrone et al. 2019).

Various terms have been used to describe such partnerships including multistakeholder initiatives, public-private partnerships (PPP), cross-sector collaborations, hybrid governance mechanisms (HGMs), and others (Florini and Pauli 2018; Mert 2014). Yet, regardless of the term the reason for their formation remains the same – to tackle an issue that is beyond the scope and abilities of any one organization and that must be addressed collectively.

## Implementation

In order for the SDGs to be implemented, the U.N. acts as the global coordinator. The U.N. uses different internal agencies, programs, and commissions to help provide guidance, funding, and technical assistance. It also provides a forum to report on global progress and provides electronic communication platforms for countries and other actors to share information on various efforts and best practices. Yet, one obstacle the U.N. faces is that nation states maintain their sovereignty, or independence, to implement the goals and is on voluntary basis.

With the creation of the SDGs, the U.N. will meet every 4 years at a global summit to report on progress through the High-Level Political Forum (HLPF). The first global gathering to report on the progress occurred in September 2019 and numerous countries submitted their Voluntary National Reviews (VNRs). The VNRs are the reports on the progress made within each country. Meanwhile, more frequent meetings and updates have occurred and are primarily coordinated through the Economic and Social Council (ECOSOC) and its various divisions and other specialized agencies in the U.N. and global partners.

The concept of sustainable development has been around for decades and increasing action is taking place at the local level. At the 2019 global summit, cities around the globe presented their own Voluntary Local Reviews (VLRs). New York City in the United States was the first city to file a VLR with the U.N. and many cities have now done so.

## Food-Energy-Water (FEW) Policies

Food policies in the USA involve a complex system of federal, state, and local laws and agencies. The US Government Accountability Office (GAO) has reported for more than four decades on the fragmented system and has added the issue to its high risks areas in need of reform (U.S. Government Accountability Office 2017). The most recent large-scale change in food and agriculture policies came with the Food Safety Modernization Act (FSMA) of 2011. The most significant change was focusing on prevention of food borne illnesses rather than responding to them. Part of the act allows for on-site farm inspections and numerous safety guidelines. Under the act, certain operations and many types of agricultural goods are exempt from inspection including (1) items grown for personal or on-site consumption and (2) operations that average less than $25,000 in annual sales over 3 years So, many small-scale urban operations would be exempt under the act requirements.

While states are left to determine their energy policies, the USA does provide some support through various Department of Energy programs: the State Energy Program (SEP) funding and technical assistance to the states. Several pieces of legislation have expanded the program since its inception and millions have been provided to the states in direct and grant funding to improve energy efficiencies and consumption. The primary office for partnership-based sustainable development initiatives is the Office of Energy Efficiency and Renewable Energy. The office is involved in numerous projects and initiatives seeking to increase energy efficiency and improve electricity

grids, while also collaborating with private organizations, researchers, other nation states.

Much like energy, water allocation policies are left to the states, while water quality standards are overseen by federal policies (i.e., Clean Water Act). In the entire USA, approximately 12% of water withdraws were from the municipal sector, 45% is for thermoelectric power, and 33% is for agricultural irrigation as of 2010; yet varies greatly by state (U.S. Government Accountability Office 2016). Municipalities can reuse wastewater through nonpotable, indirect, and direct potable with each containing various mechanisms and treatments (U.S. Government Accountability Office 2016).

## Food-Energy-Water (FEW) Nexus in Urban Areas

The U.N. reports that the global population is expected to nearly double by 2050 and is expected increase most dramatically in cities and urban areas. Yet, there is no existing comprehensive national strategy, guidelines, or mandates regarding sustainability in the USA. This places additional focus at the local level and relates to SDG 11 – Sustainable Cities and Communities. As a result, demands for natural and human-dependent resources in these areas will also substantially increase. This is especially true for resources such as food, energy, and water.

As a result, scholars and scientists have come to realize that resources should no longer be thought of in a silo approach, or in isolation, and efforts need to simultaneously increase food, energy, and water for the benefit of human wellbeing, for economic production, and to preserve the environment (Pahl-Wostl 2017). Thus, many of the SDGs are also related to each other and connected. One concept that has emerged to understand this connectedness is known as the Food-Energy-Water (FEW) Nexus as illustrated in Fig. 1. The idea is that the lack or overuse of one resource (i.e., water) can have negative impacts on others (i.e., food/irrigation of crops). Further, those responsible for oversight of these individual resources should account for the other resources when making decisions. Here partnerships can bring together the different stakeholders to make more informed decisions that can help to reduce the negative impacts from making decisions in isolation.

## Examples from Florida, USA

To provide evidence how partnerships have been utilized in working toward sustainability development and the SDGs at the local level, three examples are provided from the state of Florida. The first two are projects from the greater region of Miami in south Florida, Dania Beach PATCH and Urban Farming Institute. The other example is from Central Florida and efforts by the City of Orlando.

The Dania Beach Peoples Access to Community Horticulture (PATCH) is a market garden which provides fresh, locally grown produce to the community and region through a farmer's market and community events. The project was developed primarily through partnerships with many entities across the community and region. The project developed a vacant piece of land that was used as a trash dump site into an asset in the community and improve the overall well-being and health of residents. This includes improved nourishment, therapeutic activities, educational opportunities, and sustainable urban practices among others. Existing and potential future resource development on this site includes: (1) energy

**Partnerships and Network Governance for United Nations Sustainable Development Goals (SDGs), Fig. 1** Food-Energy-Water (FEW) Nexus

generated from photovoltaic systems (solar panels) can be used for supporting agriculture production ("energy for food"), as well as for water distributions and heating water as steams ("energy for water"); (2) water steams can be used to in the anaerobic digestion process for production biogas ("food for energy") as an alternative energy source ("water for energy"); and (3) water harvested from rain barrels or stored in the detention/retention ponds can be used for irrigation ("water for food"), and advanced irrigation technologies to enhance water use efficiency and reduce water use ("food for water").

The Urban Farming Institute (UFI) in located in the City of Oakland Park is a nonprofit organization that created this project through numerous partners and contains several different components including community gardens, chef garden, an apiary, a permaculture area, and a warehouse and resource center. They also provide field trip opportunities for students, schoolground gardens, chef-demonstrations, and volunteer opportunities. Existing and potential future resource development include: (1) rainwater harvesting which can be used for irrigation and food production ("water for food"); (2) photovoltaic panels for solar energy generation to power hydroponic systems ("energy for food") and water distribution ("energy for water").

The last location is the City of Orlando. The municipality has been a leader in sustainability initiatives in the USA and has developed community action plans that outline the dozens of initiatives and actions taken by the city and community partners. Some initiatives include expanded public transportation, LEED-certified municipal buildings, fleet vehicle energy use conversion, increased recycling rates, increasing the tree of trees planted in the city, and many More recently, the mayor created the city's first Office of Sustainability and Resilience to further implement and coordinate the initiatives and community action plan. With their latest community action plan, the City of Orlando innovatively incorporated the SDGs into the plans and how they are meeting them. The city was also one of the first in the world to file previously mentioned VLR in 2019 at the U.N. global summit.

The three previous examples do vary. Yet, the one major item they have in common has been the support of partnerships and inclusion of stakeholders in the process and projects. The partnerships have provided numerous community benefits and have allowed these projects to flourish.

## Conclusion

As was introduced in the beginning of this entry is the need for partnerships to work towards sustainable development and achievement of the global SDGs. The SDGs are a collection of goals to overcome undesirable conditions and trends that affect individual's well-being and the health of the environment. Partnerships can help to overcome the fragmented structure of policies, stakeholders, and resources to improve decision making and meeting the end goals – making sure no one is left behind and meeting the needs of the present without harming the needs of future generations.

# Path-Goal Theory of Leadership

*Leadership and Public Management*

Mary Jane Kuffner Hirt
Indiana University of Pennsylvania, Indiana, PA, USA

## Synonyms

Contingency Theory; Expectancy Theory; Leader-member Exchange Theory; Transactional Leadership Theory

## Definition

The definition of path-goal leadership theory has changed over time. House in 1971 specified that the leader's motivational function was to increase "personal pay-offs to subordinates for work-goal attainment and make the path to these pay-offs easier to travel by clarifying it, reducing road blocks and pitfalls, and increasing the opportunities for personal satisfaction en route" (p. 324). Citing a need for consistency with existing theory and empirical testing, House reformulated the definition of path-goal leadership theory in 1996 by stating "leaders to be effective engage in behaviors that complement subordinates' environments and abilities in a manner that compensates for deficiencies and is instrumental to subordinate satisfaction and individual and work unit performance" (p. 323). House's 1996 definition continues today.

## Introduction

Robert J. House's 1971 path-goal theory of leadership extended the work of Martin G. Evans and used expectancy theory to describe the interactions between leaders and their followers to answer the question: "How do leaders motivate followers?" The theory is considered a classic in the field of organizational behavior and the earliest leadership theory that convincingly specified multiple leader behaviors (Jermier 1996). The theory is leader centric and focuses on the influence leader behavior has on follower performance and satisfaction. Initially, the theory emphasized the leader's individualization of behavior choices to meet the capabilities and needs of each subordinate. However, the theory's complexity and absence of specific measures for empirical testing are often cited as research challenges. In 1996, House, in response to the methodical issues and his belief that all theories change, reformulated the theory to include groups within the workplace and value-based leadership. Support for the application of path-goal theory through the use of models to guide the leader's choice of behaviors was evident in the late 1980s. Manager and leader as well as follower, subordinate, and employee are used interchangeably in the path-goal leadership theory literature.

## Theory Development

House is generally credited with the development of path-goal theory even though it is rooted in the work of Evans (1970) and others including Stodgill and Coons (1957), Vroom (1964), Georgopoulos et al. (1957). House's theory relies on the same basic assumption as Evans' expectancy theory where followers in order to attain satisfaction are assumed to make rational choices about where to direct and expend their effort and energy within a limited number of alternatives.

Employees will be motivated by leaders if they believe in their ability to perform their assigned work tasks, think their work-related efforts will lead to appropriate outcomes, and consider work related to outcomes will be meaningful. By adding situational moderator variables, House's path-goal theory embraced Vroom's belief that managers can learn to become more effective leaders by matching one's leadership style to the demands of the situation (Vroom 2007) and attempted to resolve inconsistent research findings related to the effects of task versus people-oriented leader behaviors (Lussier 2004).

Path-goal theory assumes leaders work in close proximity to subordinates and are able to accurately assess employee capacities and needs. Effective path-goal leaders will provide or ensure the availability of valued rewards for followers (the goal) and then help them find the best way to get there (the path). They will help their followers identify and remove road blocks and avoid dead ends and supply emotional support when necessary. The leader's actions should strengthen followers' beliefs. If followers exert a certain level of effort, then they will be more likely to accomplish a task, and if they accomplish the task, then they will be more likely to achieve some valued outcome (Hughes et al. 2006; Northouse 2015; Rowe and Guerrero 2013).

Leaders are expected to use the appropriate leadership style regardless of their preferred style and be willing to learn new behaviors. Consequently, leaders must be insightful, flexible, and emotionally intelligent in order to adapt their range of leader behaviors to the daily variability of situational factors (Jaffee 2001; McShane and Von Glinow 2003; Lussier 2004). House though cautioned that the motive arousal potential of the leader's message is bounded by the leader's personal nature, the followers' susceptibility to the message, and the appropriateness of the motive to the situation (1971).

## Path-Goal Theory Evolved from 1971 to 1996

House revised path-goal theory twice from 1971 to 1996. Regardless of the version, the theory focuses considerable attention on the day-to-day interactions between the leader and the follower and reinforces the leader's responsibility for helping subordinates find the appropriate path to attain organizational goals in an efficient and effective manner (DuBrin 2009; Northouse 2015). Critical to the process is recognition that different leader behaviors will differentially affect subordinate motivation and their impact will depend on subordinate and task characteristics (Jaffee 2001). In 1971 the theory specified two types of leader behavior: directive and supportive. In 1974 House added two leader behaviors: participative and achievement oriented. In 1996, House reformulated path-goal theory by expanding from a focus on individual subordinates to the leader's influence to the work group and added four more leader behaviors to the definition: interaction or work facilitation, group-oriented decision process, representation and networking, and value-based leader behavior. Situational factors associated with the environment and subordinate and used to determine leadership style remained constant from 1971 to 1996. The 1996 revision while deemed quite complex (DuBrin 2009) also laid the groundwork for recognition that there may be instances when leader behaviors were of little or no consequence. As Bass noted, the leader "needs to complement only what is missing in a situation to enhance the subordinate's motivation, satisfaction, and performance" (1990, p. 627).

## Path-Goal Theory Components

Eight types of leader behaviors and two situational factors are specified in the current version of path-goal leadership theory. Subordinate and organizational environment factors are used to determine the appropriate leadership style. An effective choice of leadership style will facilitate subordinate goal attainment and satisfaction. The eight leader behaviors are directive, supportive, participative, achievement oriented, work facilitation, interaction facilitation, group-oriented decision process, representation and networking, and value based.

*Directive* leader behavior is a clarifying behavior where the leader provides high psychological

structure and is appropriate when the follower wants an authoritarian leader with an external locus of control, where follower ability is low, the environment is complex or ambiguous, formal authority is strong, and the work group provides job satisfaction. *Supportive* leader behavior focuses on the satisfaction of subordinates' needs and preferences by providing high consideration or a highly psychologically supportive environment. The leader creates a friendly and calming atmosphere where stress is alleviated, and subordinates are able to develop self-confidence and attain a sense of significance or equality. This behavior is appropriate when follower ability is high, tasks are simple, formal leadership is weak, and the work group does not provide the follower with job satisfaction. It also appropriate when the followers do not want an autocratic leader and prefer an internal locus of control. *Participative* leader behavior encourages subordinate influence on decision-making and work unit operations. It is appropriate when follower ability is high and followers want to be involved and prefer an internal locus of control and when the task is complex, authority is either strong or weak, and job satisfaction derived from coworkers is either high or low (Lussier 2004, pp. 149–152). Participative leader behaviors increase individual worker effort and performance and provide opportunities for peer pressure to facilitate and enhance organizational performance (House 1996). *Achievement-oriented* behavior encourages performance excellence. The leader sets difficult but achievable goals, expects followers to perform at their highest level, and rewards them when goals are met. This behavior is highly directive and structured and high in support and consideration. It is appropriate when followers are high in ability, are open to an autocratic leader, and have an external locus of control and when the task is simple, authority is strong, and job satisfaction from coworkers is high or low (Lussier 2004). Achievement-oriented behavior encourages differentiating the levels of contingent reward and emphasizes self-revitalization of followers through work goals. *Work facilitation* focuses on leader behaviors that involve planning, scheduling, and organizing work and personally coordinating the work of the subordinates. Through *interaction facilitation* behavior, the leader focuses on fostering collaborative and positive interactions among work group members, resolving disputes as they arise, facilitating communication within the work group, and encouraging close satisfying relationships among members. *Group-oriented decision process* behavior concerns how decisions that affect the group are made. In this behavior, the leader poses problems not solutions, searches for and identifies the mutual problem-solving interests among group members, encourages all members of the group to participate in discussion, and ensures that participation is balanced across the group as alternatives are sought and considered. *Representation and networking* involves the leader's presentation of the group in a favorable manner and communicating the importance of its work to other members within the organization and networking to seek and maintain positive external relationships. According to House, *value-based* leader behavior inspires extraordinary follower commitment, identification with leader or organizational goals, and performance above and beyond the call of duty. Such effects are accomplished by appealing to subordinates' cherished values and non-conscious motives and by engaging their self-perceived identities, enhancing their self-efficacy and sense of consistency, and making their self-worth contingent on their contribution to the leader's mission and collective. The leader uses symbolic behaviors that emphasize the values inherent in the collective vision and frequent positive evaluations of followers and the collective (1996).

Subordinate situational factors are characterized in terms of authoritarianism, locus of control, and ability. Authoritarianism is the degree to which employees defer to the leader and want to be told what to do and how to perform. Locus of control is the extent to which employees believe they control goal achievement internally or if goal achievement is controlled by others externally. Ability is the extent of the employee's capacity to perform tasks to achieve goals. The organizational or work environment is described in terms of task structure, the extent of the repetitiveness of

the job; formal authority, the extent of the leader's position power within the organization; and work group, the extent to which coworkers contribute to job satisfaction or the relationship between the followers (Lussier 2004, p. 150).

## Links to Other Leadership Theories

House's path-goal leadership theory gave rise to contingency theory with its shift from universal traits and styles of leadership to the relationships between traits and styles and the situation or context. The effectiveness of a leadership style or trait will depend on the particular situation, problem, or group of people that must be managed (Jaffee 2001). According to McShane and Von Glinow (2003) and Northouse, when leader behaviors or styles adapt to or respond to situations or circumstances as they arise, the leader's actions demonstrate contingency theory.

Aspects of transactional and transformational leadership theories are also seen in path-goal theory. The link to transactional leadership is found in subordinate motivation rooted in contractual, negotiated exchanges between a leader and a follower reward for high performance and penalties for substandard performance. Path-goal theory reflects transformational leadership when leaders inspire followers to align their own values with those of the leader or organization. (House 1996).

## Assessment of Path-Goal Theory

General understanding and study of path-goal theory remain a challenge. A need for reader clarification is apparent when authors routinely follow the definition of path-goal leadership theory with a statement beginning with "in other words." Although critics generally agree that path-goal leadership theory is complex, research results have been inconsistent, and many variables have not been adequately tested (Lussier 2004; Antonakis et al. 2004; Wofford and Liska 1993; House 1996; Hughes et al. 2006); there is recognition that path-goal theory has been researched more than any other contingency theory and is considered an important contribution to leadership theory for its conceptual framework and the guidance it provides to leaders about motivating followers (Yukl 1989; Lussier 2004; Northouse 2015).

Peak research interest in path-goal theory occurred between 1971 and 1992 when over 120 studies were conducted on varying aspects of the theory (Wofford and Liska 1993; Schriesheim and Neider 1996). Although path-goal theory is still generally found in textbooks on leadership theory or leader effectiveness, scholarly research greatly diminished after 2000. Wofford and Liska and Schriesheim and Neider are the most commonly cited assessments of path-goal theory.

Wofford and Liska's meta-analysis of over 100 studies concluded that path-goal theory has not been comprehensively tested, that research has produced generally inconsistent findings, and that the reliance on expectancy theory overly complicates the conceptualization of employee motivation. The use of many different instruments makes outcomes difficult to synthesize, and the use of surrogate measures for employee satisfaction and performance, role clarity, and organizational commitment raises questions about whether the surrogate variables could be affected by other variables.

Schriesheim and Neider attributed the decline in research to negative reviews of path-goal theory that make it more difficult for research to be published, the loss of its inherent appeal in the leadership domain, and the absence of serious improvements in path-goal theory since its initial development. They also noted that the easiest relationships have been already tested, including the difficulty of developing meaningful extensions of or modifications to the theory and concerns related to the use of self-reporting and survey research as barriers to research. Schreisheim et al. in 2006 reiterated the above issues in addition to concluding that House's theory holds for leader behavior and employee performance and satisfaction at the individual rather than the work unit level of analysis.

Other critics have warned that as the path-goal model becomes more representative of the

complexity of leadership, it may be more useful to researchers and less appealing for practical use and too unwieldy for training people in leadership styles as few people are able to remember all of the contingencies (McShane and Von Glinow 2003; Yukl 1989; Lussier 2004). Yukl and Van Fleet (1992) also believe that path-goal theory leadership theory ignores the roles leaders play in selecting talented followers, building their skills, and redesigning their work.

## Future Research Recommendations

Of the suggestions for future research, two recommendations stand out. Antonakis suggested qualitative field research would provide detail and insight and allow for greater interpretation of the theory, although it would be time and resource intensive. Wofford and Liska recommended research focused on the range and variability of available leader behaviors including adaptability, self-monitoring, environmental sensitivity, cognitive skills, and communications skills and greater emphasis of and sensitivity to motivational variables and the analysis of determinants and effects of short-term leader behavior.

## Application to Public Sector

Potential for the application of path-goal theory to public administration increased with House's reformulation of the theory in 1996. House indicated that the effectiveness of value-based leadership will increase when the leader refrains from the use of extrinsic rewards contingent on subordinate performance. Without extrinsic rewards, workers will look for self-related justifications and satisfaction for their efforts, and leaders will be better able to foster an ideological orientation toward work (House 1996). Toward this end, Schriesheim et al. (2006) reported research results associated with lower-income social service agency employees in highly bureaucratic settings demonstrated the potential for altruism or intrinsic rewards to become a motivator when extrinsic factors such as pay raises, training opportunities, promotions, and improved working conditions were not generally available or alterable. Social service employees motivated to provide services to people in great need may see the service as a valued outcome and derive satisfaction when a positive outcome is achieved.

## Conclusion

Path-goal leadership theory initially focused on leaders and their individualized effect on subordinates in the workplace. Over time, House's definition of path-goal theory changed in response to existing theory and the limited results of empirical research. Today, the focus is still on the leader but considers the leader's effect on groups and individuals and acknowledges that there may be no need for leadership intervention in some circumstances for followers to attain goals and achieve personal satisfaction.

Path-goal leadership theory research peaked by the early 1990s. Narrowly structured rather than comprehensive studies of the theory predominated. Difficulty associated with determining whether study variables actually measured path-goal theory became a recurring criticism.

Recognizing the limits posed by the absence of measures directly representative of his path-goal theory, House redirected his attention to work groups and the value-based leadership theory that stresses intrinsic rewards for goal attainment and may be more relevant as a leadership theory within public organizations where managers constrained by personnel systems and limited resources generally have few tangible rewards to offer their subordinates. Today, value-based leadership is more commonly known as charismatic leadership.

# Pathways to Electronic Citizen Participation: Policy and Technological Arrangements in Korea

Hoa Thai, Hyesu Im and Younhee Kim
School of Public Affairs, Pennsylvania State University Harrisburg, Middletown, PA, USA

## Synonyms

Direct democracy; E-governance; Participatory government

## Definition

| | |
|---|---|
| E-participation | Technology-mediated citizen participation to promote authentic democracy in government |
| E-communication | Citizens access to government information and government responses to citizen inquires to exchange information and concerns |
| E-consultation | Deliberative interactivity between government and citizens to obtain initial inputs from citizens on pre-identified issues set by government and newly initiated issues raised by citizens in the public service cycle |
| E-co-production | Citizens' joint contributions to produce the real needs of the individuals and the communities in the policy-making cycle |

## Introduction

Participatory governance is one of the fundamental governing doctrines to empower citizens in political and government decision-making

P

across countries. Its practices enable government to tailor specific issues and policies based on inclusive communication with citizens. The government, thus, has adopted institutional and procedural arrangements to create participatory environments, largely through the effective use of information and communication technologies (ICTs). The Korean government has initiated a wide range of administrative and technological innovations to make more citizens actively engage in decision-making processes. These efforts have paid off to place South Korea as one of the leading countries for incorporating the functions of information technology and communications, which promote the public's electronic participation (e-participation), according to UN E-Government Survey 2018 (United Nations 2018), Digital Governance in Municipalities Worldwide (Holzer and Manoharan 2016), and Global e-Governance Study (West 2007).

The development of e-participation has paralleled with the perspective of citizens in e-government in South Korea. As the e-government frameworks have been advanced to assist government functions, its priorities have moved from service delivery to shared governance in order to make citizens inclusive and empowered in the policy process. The quality of e-participation relies on institutional and technological supports to stimulate the effective course of action between government and citizens. The Korean government has initiated a wide range of policy agenda and launched multi-layered channels to make e-participation matter to citizens, communities, and governments. How has the Korean government empowered citizens to be active participants in government? To what extent do government policies and technological architectures endeavor to broaden and deepen e-participation? This chapter discusses the development of the e-participation domain in South Korea, corresponding to changes of policy - orientations and the use of technological applications staged into three phases: e-communication (1995–2004), e-consultation (2005–2014), and e-co-production (2015–present).

## E-communication Orientation and Applications (1995–2004)

The early phase of the e-participation state promotes citizen access to government information and government responses to citizen inquiries. This stage of e-participation aims to proactively disseminate accessible information to the public and obtain citizen feedback and requests about what was working well and what could be important. The Korean government envisioned a participatory government by introducing new laws and policies. The Informatization Promotion Master Plan in 1996, New Korea Net-Government in 1996, New Korea Net-Public in 1996, and the Public Information Disclosure Act in 1998 have become the milestones to promote the public information disclosure and citizen access to governments (Kim et al. 2004). The Public Information Disclosure Act comes into force as one of the democratic reforms that the government implements to make Korea a more open society. The original and later revised versions of the Public Information Disclosure Act secure citizens' participation through:

- Ensured transparency: All citizens are allowed to demand information from state agencies, such as the central government bodies, municipal governments, and other public institutions.
- Prescribed obligations and procedures for information release: State agencies must follow rules and procedures with more than 40 obligations for releasing data for the public. Another obligation is to proactively disclose information about public institutions.
- Released information about state agencies' activities and performance on a number of public online service websites and open data portals.

The Basic Plan for Informatization (1995–1998, 1999–2001) is another integrated and coordinated government-wide approach to facilitate the e-communication state. The Korean government adopts various technological tools to keep the citizens updated about what their governments do. ICTs connect the government with

citizens and the other way around in conjunction with legal and policy frameworks. The government and citizen interactions were designed based on the government-centric approach, so that citizens are considered as passive information users and the audiences of the government.

The information management initiates high-speed information network projects to disseminate government information and increase citizens' broadband Internet access, which overcame space-time constraints for the citizen-government interaction. The Internet has become a place to collect citizen opinion data about public services and policies. The government started Open Government Service in 1996 to bring citizens' voice in government. An online bulletin board is first introduced to communicate between citizen and government. Cyberparty launched in 1996 allows citizens to give their opinions to revise existing laws, rules, and practices. The National Assembly Research Council on Electronic Democracy managed Cyberparty. The National Assembly members, field experts, and ordinary citizens are primary participants to share information and exchange individual inputs (National Information Society Agency 1998). The issues raised by the citizens varied extensively, from a tariff exclusion for digital instructional materials to current scientific technological subjects. The primary features of Cyberparty, as an opportunity zone for direct online citizen participation, are as follows:

- Bulletin board systems: Direct communication between the government and citizens providing free access to political information and collect citizens' opinions on policies.
- Diverse discussion categories: Citizens can debate via bulletin boards on numerous policy categories, such as legislative consulting, financial forum, policy discussion, and citizen networking.
- Selective agenda setting: The administrator represents the citizens in selecting which proposed policies for further discussions with the National Assembly members and policy experts.

## E-consultation Orientation and Applications (2005–2014)

As active citizen participation in governmental decision-making has been demanded, the government prioritizes greater interactivity and collaboration between government and citizens for gaining public trust in government. E-consultation presents more sophisticated forms of citizen-centric approach that allows citizens to personalize policies and services. Citizens have perceived themselves as partners rather than information consumers at the e-consultation stage. For an effective e-consultation relationship, the government creates competent online policy communities to promote a collaborative e-participation supported by E-Korea Vision 2006, Broadband IT Korea Vision 2007, and E-National Assembly in 2003–2007. E-Korea Vision 2006 aims to enhance the quality of e-participation and creates more user-friendly conditions for policy participation by information sharing services. Broadband IT Korea Vision 2007, a modified road map of E-Korea Vision 2006, adapts an active approach to cultivate meaningful participation through electronic voting and public opinion polls (Ministry of Information and Communication 2003). E-National Assembly constructs primary institutions of e-participation that targets to achieve internal managerial innovations within the governmental bodies. These institutions are the knowledge management system, the electronic submission, and the portal for e-participation (Special Committee for e-Government 2003).

As the experience of emerging participatory institutions continues, messages produced by the citizens exist in a massive amount and trigger online discussion and online consensus building. Thus, a new participatory mechanism is designed to facilitate deliberative discussion and mediation of conflicts. The implication behind it is that an effective participation can only be generated through harmonization and conflict resolution. The Conflict Prevention and Resolution of Public Entities 2007 supports government-citizen unity by managing conflicts through:

- Conflict management scheme: Quasi-legislative process to engage public deliberation, participatory budgeting, and open policy-making
- Establishment of conflict management agencies: The Conflict Management and Deliberation Committee and Conflict Management Support Center
- Evidence-based management of participation: Conflict impact analysis and participatory decision-making process

The technological development focuses on real-time information transmission, automatic data collection, and expansion of Internet protocol capacity. This development enables the government respond directly to the citizens' needs. It also actively engages citizens in government (National Information Society Agency 2013). Besides that, the broadband network facilitates e-participation through high-speed Internet access to every household. The Anti-corruption and Civil Rights Commission 2005 launches e-People, known as Sinmungo, to take a wide range of citizens' complaints against the government administrative actions and adjudications, government agencies' corruption, and policy proposals, featuring dispersed administrative bulletin platforms (Anti-corruption and Civil Rights Commission 2011).

The Seoul Metropolitan Government, the capital of South Korea, continues compliance and collaboration with the central government to support e-government and e-participation projects. Oasis of 10 Million Imagination is a primary platform in Seoul to promote meaningful e-participation for citizens started in 2006. Its purposes are, first, to reduce residential barriers to policy suggestions; second, to enhance efficacy and feasibility of Seoul policies from citizens' perspectives; and third, to foster a creative and accessible environment of policy domain (Seoul Metropolitan Government 2016). Once the public opinions are posted and discussed on the platform's website, selected issues would be handed over to the Seoul metropolitan government based on measures of public attention and recommendations from citizen committees. Then government experts, public officials, and citizens assess the feasibility of these selected ideas. After that, an online policy adoption meeting chaired by the Mayor of Seoul City would finalize the decision with these stakeholders. Some examples of policy ideas are parcel service storages in subway stations for women, Han River park forest trails, air quality signboards in subway stations, Braille notices of address for visually impaired persons, etc. The speed of policy decision-making process is still insufficient, but Oasis of 10 Million Imagination has increased the political efficacy of citizens to become consultative partners with government through:

- Transparent administration: The policy adoption process is opened through transparent online processes.
- Effective e-participation: The platform reduces conflicts and dissatisfaction by thoroughly and publicly collecting policy suggestions from the public.
- Prompt government response: Strong readiness and fast consulting speed from the administrative experts and civilian administrative assessors in consulting process.

## E-co-production Orientation and Applications (2015–Recent)

The growing focus on the co-production lens in public sector further advances e-participation ideology to customize citizens' contributions to policy decisions. The e-co-production state requires the government's commitment to innovate participatory tools and employ citizens' co-production outcomes. Citizens can negotiate with governments to challenge their existing policy practices and service delivery. The government begins to respond directly, not selectively, to the opinions of the citizens through social network services. Throughout the 4th and the 5th Basic Plan for Informatization Promotion in the e-consultation stage, the government attempts to mature online participatory culture. These e-participation road maps focus on citizens' co-production roles in the

decision-making processes, aiming authentic participatory governance. In 2018, the government releases the 6th Basic Plan for Informatization Promotion and the Comprehensive Plan for Government Innovation that prescribes to:

- Personalizing service-oriented government: Integrates cross-agency services to create one-stop service for each citizen, individual mobile services
- Citizen-government governance: Pushes e-participation throughout the entire policy processes and fosters collaborative governance to become a partner with citizens
- Smarter administration: Transforms administrative systems from ministry-centered (stovepiped style) to user task-centered, mass knowledge sharing through cloud computing, championing evidence-based decision-making to analyze user-generated data

The presidential office known as Cheong Wa Dae launched a petition website on August 17, 2017. Cheong Wa Dae provides an accountable platform to ensure the presidential office's response to citizen requests. A Cheong Wa Dae petition which garners over 200,000 signatures compels the government to respond, while previous platforms do not require compulsory duty of the government to issue an official response. The high quality of government response is expected to increase e-participants' satisfaction with the government trust and motivate citizens to keep participating in the policy process (Kim and Lee 2012). As of April 2019, Cheong Wa Dae has responded to 90 agendas. Cheong Wa Dae petition reinforces active citizen participation through:

- Comprehensive agenda suggestion: Citizens can suggest any opinions among 17 categories including political reform, diplomatic unification, environment, human rights and equality, health care, and others.
- Social media usage: Citizens can propose petitions or consent existing petitions through social media.
- Strengthened government response: Government and Cheong Wa Dae officials including directors of ministries and agencies and presidential secretaries are obliged to answer questions and petitions that have received 200,000 consent.

Another case of a participatory platform is Gwanghwamoon 1st connecting both online and offline, which was first launched in 2017 but later restructured as an online policy engagement bulletin board in July 2018. Gwanghwamoon 1st incorporates previous participatory platforms, such as e-People and the Cheong Wa Dae petition, to build an advanced e-participatory channel. Furthermore, the government has continuously adopted a citizen-centered approach for better e-participation by searching innovative and new technologies, such as cloud computing, artificial intelligence systems, and Community Mapping (Ministry of Public Administration and Security 2018). Table 1 summarizes the major policy frameworks and technological applications in three phases of e-participation in South Korea.

## Conclusion

The Korean government has provided various policies and information technology tools to elevate the country to one of the top e-participation enabled countries. The exemplary growth of e-participation in South Korea is the result of the government's desire to be at the front of the information revolution and the commitment for democracy through democratic participation. E-participation has been started as an extension of the conventional participation and further evolved as a transformational form of participation. The government-driven participation is an early approach to enact and design participatory decision systems led by governments, and the citizen-driven participation is a networked approach to develop greater democratic participation supported by citizens and communities.

The e-government frameworks and information technology infrastructures promote democratic discourses, so that the practices of

electronic citizen participation in South Korea have been far more inclusive to empower citizens in government processes. With multiple technological supports via web interface and mobile applications, the emphasis on e-participation has accelerated a paradigm shift from e-government to e-governance. E-participation channels should be well-designed to motivate a broad range of citizen participation, since the quality of e-participation can be evaluated by the impact of citizen inputs in decision-making. Corresponding to major revolutionary changes in technologies, Korean government has continuously incorporated new tools and sophisticated the use of existing applications. While technological advancements do not guarantee active, meaningful citizen engagement, these tools help Korean citizens to get more untapped opportunities to practice their contributions in actual decision-making processes.

The orientation of e-participation in South Korea has gone beyond ensuring basic access to government. It has focused on empowering citizens themselves in delivering their opinions to government and publicizing their concerns with government. Given the substantial changes in government-citizen interactions in South Korea during the past three decades, active e-participation has become a reality. The e-participation movement should be citizen-centric rather than government-centric. Citizens should acknowledge their leading roles to empower their participation in government. The Korean government has applied smarter approaches to initiate feasible policy agendas and design the user-friendly web-based and mobile applications responding to fast-evolving technologies, such as artificial intelligence, blockchain, analytics algorithms, and data-driven analytics. These types of technological advances should be used to minimize challenges and gaps in current e-participation practices and move it to a new level of the participatory state.

# Patronage and the Politics of District/City Creation in Uganda

Pius Gumisiriza
School of Public Policy and Governance, Uganda Management Institute, Kampala, Uganda

## Synonyms

Cities; Decentralization; Districts; Patronage; Politics; Uganda

## Definitions

Patronage is defined in this entry as mutual exchanges between a patron(s) who constitutes the source of one side of the exchange and clients who also constitute the source of exchanges on the other side. In the context of this entry, the politicians are the patrons who promise or hand out districts/cities to clients who may be community members or voter in exchange for votes or support. Politics is defined in this entry as how power or entrust authority is exercised in a society or country. District is defined in this entry as a specific area of jurisdiction specifically marked off for administrative, electoral, and other purposes in a country. A city is defined here as an urban settlement with over 400,000 inhabitants under one authority as one of its many defining features.

## Introduction

The Constitution of Uganda 1995 clearly indicates that parliament can authorize the creation of new districts out of the necessity to bring services closer to people and effective administration with special attention given to the means of communication, geographical features, the density of the population, economic viability, and the wishes of the people concerned. However, rather than serve its original purpose of

bringing services closer to the people, the entire process/experience has been politicized by President Museveni and his NRM government. They have systematically and skillfully used the creation of districts and now a promise for cities as a means of dispensing patronage by rewarding their supporters or as a condition for support in areas where they have historically not enjoyed popular support. As a result the number of districts has blown out proportion and is now a very costly burden to the taxpayer with little benefits to the broader society except for a few elites both local and national. In September 2018, the government announced that it will be merging or scrapping several government institutions and authorities which have duplicated roles or those which are draining public resources with less value addition in attempts to save resources. However, they also announced that more districts, cities, and constituencies are in the pipeline. This entry argues that political patronage is the main driver for these new districts, cities, and constituencies and if not checked, the promise of effective utilization of public resources will remain unachieved. The entry explains motivations and gives examples of new district creation in other parts of Africa and the history of district creation in Uganda, presents the current institutional framework that guides the creation of districts in Uganda and the benefits/costs of new districts in Uganda, and illustrates how elites both national and local use patronage to influence creation of districts/cities in the country.

## Patronage and District Creation in Africa

The creation of new districts as a tool to win votes, reduce ethnic tensions, or extend patronage among authoritarian leaders in many African countries is a well-tested method. Their creation is an example of a distributive policy as their benefits go to a small group of people, while their costs are spread out across the entire population. Such a policy is likely to encounter little opposition since its cost per capita is so low that those who pay for it have little incentive to organize collectively to combat it. In other words, the cost of creating each district per citizen is very small which becomes a good area for patronage (Olson 1982). In most of the countries where district creation has been a big phenomenon, the common thread is usually poor service delivery and authoritarian leadership. Thus, the whole district creation projects are intended to shore up political support than service delivery, and the leaders are able to get away with it because in actual sense they are the ones that shape the nature of institutions rather than institutions shaping their behavior, a scenario that agrees with the actor-centered institutionalism approach which argues that institutions are not necessarily created to be socially efficient but rather created to serve the interests of those with the bargaining power to make new rules (see Scharpf 1997). For example, in 1994, 2 years before his first election, President Omar al-Bashir of Sudan tripled the number of federal states from 9 to 27. In 1997, President Blaise Compaoré of Burkina Faso created 15 new provinces in time for a parliamentary election that year and his successful first reelection the following year. In 1999 2 years before his reelection, President Mathieu Kérékou of Benin doubled the number of his country's provinces from 6 to 12. In 1998, a year before his reelection, President Bakili Muluzi of Malawi and his government created three new districts. In 1999, 2 years before his first successful reelection, President Idriss Déby of Chad also doubled the number of his country's prefectures from 14 to 28. In the Democratic Republic of the Congo, the new constitution increased the number of provinces from 11 to 26 in February 2006, 5 months before the first round of the country's presidential elections, while in Ghana President John Kufuor's government created 28 new districts in 2003 and another 28 districts in 2007 and in both cases a year before presidential and parliamentary elections (Green 2008). Literature has also shown that new districts are sometimes created by central-level political elites in order to manage ethnic tensions and thus ensure political stability (Treisman 2007; Oviasuyi et al. 2010; Awortwi and Helmsing 2014).

## History of District Creation in Uganda

The creation of districts as local government administrative units in Uganda can be traced from the early colonial days. In 1919, the colonial state in Uganda established the *African Native Authority Ordinance* that guided the duties and powers of African chiefs in the colonial administration that included maintaining law and order, presiding over native courts, and collecting taxes at the village, subcounty, and county levels. The chiefs were accountable to the principal representative of the central government and executive head of the district that was a district commissioner. In 1949, new changes were made under the Local Government Ordinance, and the district was established as a fairly autonomous administration with a council comprising of elected members responsible for district administration under local government arrangements. Under this arrangement, the chiefs remained salaried local government officials answerable to the central government through the district commissioner, and the central government retained overriding powers over district council decisions. By the time of independence in 1962, Uganda had 11 districts and 4 kingdoms of Buganda, Ankole, Tooro, and Bunyoro. The Independence Constitution of 1962 granted Buganda kingdom a federal status, while the territories of Busoga, Ankole, Bunyoro, and Toro were accorded semi-federal status, and the rest of the country comprising of Acholi, Bugisu, Kigezi, Lango, Bukedi, Karamoja, Madi, Sebei, and West Nile districts were administered through councils. When Prime Minister Milton Obote abrogated the Independence Constitution in 1966, its 1967 successor centralized powers. Idi Amin overthrew the Obote government through a military *coup* in 1971, immediately dissolved districts, and replaced them with regional/provincial administrations led high-ranking military governors. Centralization of power gradually but steadily increased in Uganda in those years as the second Obote government (1980–1985) also never made any significant efforts to change Amin's system. In all together, Uganda had 33 districts in 1986 when Museveni and his NRA rebels captured power (Ojambo 2012).

## Institutional Framework for District Creation in Museveni's Uganda

Shortly after capturing power, in 1987 the Museveni government established a commission of inquiry under the leadership of Mahmood Mamdani, which spent several months touring the country and prepared a white paper that was presented to government, and henceforth the government vigorously embarked on decentralization based on the resistance council system. The government enacted the Resistance Councils and Committees Statute, which repealed the Urban Authorities Act 1964, part 1 of the Local Administration Act 1967, and marked the beginning of decentralization process under the movement government by transferring such powers as planning, decision-making, and the administration of justice to the community-based resistance council system. The Mamdani Commission was hesitant to recommend the creation of new districts arguing that these would increase unproductive costs of administration and also feared that the experience of the past decade where new districts were created arbitrarily, haphazardly, and hardly defensible would be repeated. The Commission accumulated 11 requests for the creation of new districts, of which it only recommended 4 and a review of all existing districts with a view of degrading those that did not meet minimum criteria. Museveni never pursued this recommendation but also withheld the creation of any new districts except for Kalangala (comprising the Ssese islands in Lake Victoria) in 1990 and Kiboga in 1991. By 1995 when a new constitution was promulgated, the Museveni government had created only six new districts. The 1995 Constitution of the Republic of Uganda, the Local Government Statute 1993, and the subsequent Local Government Act 1997 provide the legal framework on how a new district can be created. Chapter 7 of the Local Government Act (1997) stipulates that the boundaries of a local government or of an administrative unit shall be those that existed immediately before the coming into force of this Act. Article 179(4) of the 1995 Constitution allows for the creation of new districts if the concerned people demand them and

the intentions are bringing services closer. The Article stipulates that (1) parliament may (a) alter boundaries of districts and (b) create new districts, (2) any measure to alter the boundary of a district or create a new district shall be supported by the majority of all members of parliament, (3) parliament shall by law empower the district councils to alter the boundaries of the lower government units and create new local government units within their districts, and (4) any measure for the alteration of the boundaries of or multiplication of districts or administrative units shall be based on the necessity for effective administration and the need to bring services closer to the people, and it may take into account the means of communication, geographical features, density of population, economic viability, and the wishes of the people concerned (The Constitution of the Republic of Uganda 1995). Whereas the law is clear on the rights of all citizens to access better services through local government units, there still remains no clear criterion on when and how many districts should be created. The established parameters such as population size, economic viability, geography, cultural identity, people's wishes, and the quest for proximity of services that should be considered when curving out districts have unfortunately not been strictly adhered which has resulted in creation of new districts and now cities in a haphazard, arbitrary, and hard to defend manner (see Green 2008). In 1996 after the general election and just 1 year after the promulgation of the constitution, there were 42 districts in the country. By 2005, the numbers had escalated to 78 and 111 by 2010, and in 2018, there are over 112 districts, over 20 are in the pipeline, 6 more cities have been approved, and parliament is bloated with 427 members who are also meant to increase with more districts.

## Benefits of New Districts

The creation of new districts has been praised by local people and leaders in those districts and defended by central government ideologues as an effective way of bringing services and opportunities such as boreholes, schools, roads, health centers, increased citizen participation, a high sense of ownership and control in the delivery of services, determination of the development agenda, promotion of cultural identity and unity, a strategic move to reduce rural-urban migration and therefore lessen the pressures on the few existing urban centers, inclusion of marginalized groups in development processes, and creation of jobs directly and indirectly. Every new district created comes with at least over 50 public service jobs including chief administrative officer, resident district commissioner, land officer, district auditor, district engineer, district planner, education officer, gender officer, youth officer, finance officer, inspector of schools, district police commissioner, district chairman, and several council representatives to mention only a few. There are also opportunities that come to lower local government officials who are promoted upward and jobs created by NGOs/donors who set up offices in the new districts and provide budget support and conditional grants to the districts adding to potential local patronage opportunities. For example, it has been noted that due to district creation, the USAID-supported Uganda Program for Human and Holistic Development expanded its coverage from 20 to 34 districts in 2008 (Green 2008). For NRM government supporters and President Museveni, another direct benefit for creating as many districts as possible is to split the opposition power bases in opposition strongholds especially in the northern and eastern districts of the country where political instability and marginalization pushed the population toward the opposition (see Awortwi and Helmsing 2014). However, for the opposition and partners interested in Uganda's democratization process, district creation has been a mechanism for enlarging patronage which has eaten into their powerbase that a bid setback. Reducing ethnic tensions among different groups within the same districts has also been used as a justification to create new districts in places like Mbarara (created Kiruhura mainly for the Bahima away from the other Bairu sections of Mbarara District), Yumbe from Arua, Kibaale from Hoima, and Nakaseke from Luwero, among many other districts. Ethnic conflicts existed even in precolonial communities that

now make Uganda, but these were exaggerated by the British colonialists who lumped people of different ethnic groups together in an effort to create political administrative units with smaller tribes being marginalized in politics and administration, a mistake that was not rectified by previous governments (see Musisi 2015).

## Costs of New Districts

Technical experts and several research studies conducted on the impact of district creation and service delivery in Uganda have concluded that contrary to expectation of improved service delivery, the process has been captured by local and national elites to serve their corrupt/political interest and led to the balkanization of the country into unviable economic units which comes with a huge administrative cost that is borne by the taxpayer (see Green 2008; Ayeko-Kümmeth 2014). According to the Ministry of Finance, Planning and Economic Development, creating a new district or a city costs Shs 16.63 billion and requires well over Shs 59.25 billion in its first year of existence to cater for salaries, allowances, gratuity, buildings, operating new administrative unit's offices, and a public service commission. From a technical perspective, the Secretary to the Treasury, Mr. Keith Muhakanizi, has repeatedly said it is unaffordable and unsustainable to create more administrative units because the wage transfer from the central government to the local governments has already escalated to unacceptable proportions. It increased from Shs 541 billion in the 2006/2007 fiscal year to Shs 1.07 trillion (2013/2014) – 4% of Uganda's current budget (Wesonga 2015). Most commentators in the country including academicians, parliament, development partners, civil society, public service officials, and majority of the public agree with this analysis that already with 427 members of parliament, 112 districts, and a highly bloated government, there is no need to create more new districts because they are just financially unsustainable. Nevertheless, President Museveni has pledged to elevate 6 municipalities of Mbarara, Mbale, Arua, Gulu, Hoima, Moroto, Nakasongola, Fort Portal, and Jinja into cities (administratively, a city is considered to be an equivalent of a district), and 20 more districts are in the making before 2021 elections. If research, general population, and technical experts in government institutions like the Ministry of Finance, Public Service, and Bank of Uganda are all in agreement that creation of more new districts and cities is not the way to go because of the costs involved, then what exactly explains President Museveni and his government's desire to create more of the same? Patronage and politicization of the whole idea and process of district, city, and constituencies has been blamed for the mess as discussed hereunder.

## Patronage at Central Government Level

In Uganda, President Museveni was very popular among Ugandans and the international community in the early 1990s. He implemented structural reforms, which endeared him with the donor community that kept money flowing in. He also formed a broad-based government that included many real and potential political rivals such as the late Ssebaana Kizito and Dr. Paul Kawanga Ssemogerere of the DP party. In his first democratic election in 1996, Museveni won with overwhelming support. At that time, corruption was at its minimum, and Museveni was generally still viewed as a leader steering Ugandan toward a democratic path, constitutionalism, and economic transformation. However, by 2001 most of the promises were exposed as a sham, opposition leaders such as Ssemogerere had left his government, and serious cracks appeared from within his NRM ranks as one of his cadres Colonel Dr. Kizza Besigye challenged his presidency. Museveni's popularity in Uganda has decreased year after year from 2001 to date, and yet the number of districts has increased tremendously from 56 in 2000 to 112 in 2018 and from 1 city of Kampala to 7 (6 are being approved) cities by 2021. Museveni's diminishing electoral support over the years, coupled with the increasing number of new districts/cities, fits in well with patronage theory that the more vulnerable an incumbent politician is, the more likely he/she is to use

patronage to win votes (Stein and Bickers 1994). Indeed, several studies have argued that district creation has been primarily used by President Museveni to win elections and stay in power (Green 2008). Examples have been given to illustrate this point, for instance, when Ngora County was elevated to a district status in 2010, its residents who had voted Museveni with 27.4% in 2006 appreciated and voted NRM in 2011 with 48.2% (Awortwi and Helmsing 2014). There is also evidence to show that promising to or elevating marginal counties to district status in a given inter-election period leads to a significant increase in Museveni's vote share in those counties in the next presidential elections. For instance, in 1996, he promised voters to give them districts if they voted him, and in 1997, he delivered the pledge with six new districts after they overwhelmingly voted him. In 2000 and 2005, Museveni ordered the creation of new districts just a few months before presidential elections the following year, and ten new districts were created in 2006 after the presidential elections. Through this patronage cycle, Uganda had 112 districts in 2012, and yet again the government ordered the creation of 25 new districts to all to be operational by 2019 making a total of 137 districts (see Odyek et al. 2012). With over 130 districts, there is general fatigue among the political establishment and general population on creation of more districts. To maintain its support among the general population using the same patronage approach as in the creation of districts, the government has now focused its eyes on elevating trading centers into town councils, town councils into municipalities, and municipalities into cities. President Museveni and his cabinet endorsed the creation of four regional cities in Gulu, Mbale, Mbarara, and Arua and five strategic cities in Hoima (oil), Nakasongola (industrial), Fort Portal (tourism), Moroto (mining), and Jinja (as an industrial city) pending parliament ratification (Wesonga 2015). The main argument given by the government is that these different cities will help create job opportunities in other parts of the country, reduce migration into Kampala, and help in creating balanced development in the country because at the moment, Kampala controls over 65% of the national GDP. While the creation of cities may be a plausible idea given the increasing rapid urbanization and need for well-planned urban environments, this entry argues that the process of expanding the territories of selected municipalities has been corruptly hijacked by the political elite to include or exclude certain areas on the existing municipality boundaries in ways that favor these elites and the areas they represent while disadvantaging other well-deserving places which is likely to affect negatively the long-term planning, sustainability, and service delivery in these proposed cities. However, Museveni's expectation is that like all the previous cases of new districts creation, these municipalities, cities, and new district will generate more votes and support him in 2021.

## Patronage at Lower Levels of Government and Communities

It is not only patronage emanating from President Museveni or the central government that is responsible for a barrage of new districts in Uganda. One that most communities hand local elites have learnt that this is one of the methods of squeezing some benefits from the government and the main distributor (President Museveni) is now vulnerable politically, they do demand to have districts curved out of their counties or cities curved out of their municipalities. Indeed, many studies have indicated that local elites in communities that later become new districts have used their resources and networks to lobby or demand for new districts or city. This argument is best exemplified in the example of Bushenyi District where the president was vehemently opposed to its split to create new districts because of its problematic politics, but the elites in Sheema County (now Sheema District) use their influence to force government and President Museveni into submission and grant them a district. President Museveni and three out of four ministers who hailed from Bushenyi District were vehemently opposed to splitting it into several districts in the early 2000s. Their opposition stemmed from the fact that people in Bushenyi District were ethnically the same and spoke the same language, it was a very strong Museveni supporting area, the

government had a very constrained budget, and it was one of the richest districts in the country with a fairly developed road network, schools, health centers, and high agriculture production. All these factors worked together to make Museveni and his government officials at the center to oppose the idea of splitting this district. However, in 2010 the president shifted his position and agreed to split Bushenyi District into five districts of Buhweju, Sheema, Mitooma, Rubirizi, and Bushenyi mainly due to pressure from local entrepreneurs who also demanded a share of the patronage resources that come with new districts (Tabaro et al. 2018).

## Patronage and Politics in City Creation

The elevation of municipalities into cities also fits into the three narratives where on the one hand President Museveni gives a promise to create cities in return for support or municipalities demanding from government that they should be elevated to city status. Then both local and national elites jump in to influence the entire process with patronage as exemplified in the creation of Mbarara City. As earlier noted, in 2015 President Museveni and his cabinet endorsed the creation of four regional cities and five strategic cities pending parliament ratification. For an area to qualify to become a city in Uganda, it should have a population of 350,000 people, a master plan land use, and water sources and be able to meet over 50% of the cost of providing social services and its projects. All the proposed cities fall short of the major requirements especially population and raising funds to meet their running and development costs. According to the Uganda's National Population and Housing Census 2014 results, the population of Jinja Municipality was 72, 931, Arua 62, 657, Mbarara 195, 013, Gulu 152, 276, and Mbale 96, 189. Thus on the population criterion, all the four proposed cities fall short of the numbers. What all of them decided to do was to have their councils vote in support of merging with some nearby town councils on condition that those town councils too agreed. For instance, Arua Municipality with a population of 62, 657 decided to merge with Pajulu (60, 210), Oluko (38, 491), Ayivuni (22, 528), Aroi (24, 241), Manibe (28, 938), and Vurra (133, 640). Jinja Municipality with 72, 931 people took up Budondo (51, 560), Mafubira (78, 895), Kakira, Busedde (36, 152), and Bugembe Town Council (41, 323). However, what was not clear was the criterion Mbarara and Gulu municipalities would use to merge with the neighboring territories to meet the population criterion because the outlying areas did not have master plans or insufficient revenue streams (Wesonga 2015). It was in this lack of clarity that both local and national political elites influence their places to either be incorporated into Mbarara Municipality or be excluded depending on how either of the two benefited their political interests.

Before its elevation to a city, Mbarara Municipality was composed of three divisions of Kakoba, Nyamitanga, and Kamukuzi division with a total population of 195, 013 according to the 2014 population census. It is the main and biggest town within the western region of Uganda lying at the intersection of major transportation routes going to Rwanda, Eastern DRC via Kasese, and Northern Tanzania via Isingiro District and Mutukula border. The town serves many neighboring districts and has been growing rapidly in the last 20 years. In recent years, the local leadership has been lobbying the central government to have Mbarara elevated into a city. However they did not meet the population criteria. Thus Mbarara municipal council leadership lobbied the neighboring territories. The territories that were finally included on the municipality were Nyakayojo Subcounty and Rwampara County that government is going to elevate into a district in 2019 financial year and two parishes of Nyakishenyi and Kishasha from Biharwe Subcounty in Kashari County. Nyakayojo Subcounty is largely a rural place with most of the population engaged in subsistence agriculture and petty trade distributed among six parishes of Katoojo, Bugashe, Kichamba, Rwakisakizi, Nyarubongo, Rukyindo, and 62 villages. Apart from Katoojo and Rukyindo parishes which are relatively flat and close to the previous territory of Mbarara Municipality, the rest of the parishes are mountainous and very far in terms of distance. The two parishes of Nyakishenyi and Kishasha that were

incorporated from Biharwe are also rural with most of the people engaged in subsistence agriculture and petty trade. The local leaders in Nyakayojo Subcounty headed by Jomo Mugabi, the LC III chairperson, and majority of the population welcomed the idea of being added on Mbarara Municipality to create the city because this comes with huge benefits because being part of the city comes with direct resources from the central government and Mbarara City council in terms of service extension such as roads, piped water, schools, direct jobs, electricity, and better health services. In fact the leadership of Nyakayojo Subcounty not only lobbied the higher political establishment to achieve this ambition, but they also warned that they would never be part of the proposed Rwampara District and they had their wish granted because government knew that unless it gave in, there would be political consequences when elections come (see Kabasongora 2011). Ironically the immediate territories of Kyeera, Nyarubungo, Kaberebere in Isingiro, and parts of Bubale Subcounty which are already urbanized and are very close to Mbarara Municipality have been excluded from the city for selfish reasons by the political elite. Hon. Bright Rwamirama is the area MP, is the Minister for Veterans, is very wealthy, and is a close relative of President Museveni. His son is also an MP representing the youth in the region. Rwamirama feared that if he allowed part of his territory to be incorporated into the city with his home also taken, he would have to contest election with Mbarara where the competition is stiff and most leaders usually have one term in offices. This would have been suicidal to his career or the future career of his soon. He therefore used his national and local networks to ensure that the parts of his constituency were not made part of the city yet they are the closest and most urbanized. These examples are not isolated but in fact the new normal in the creation of districts, cities, and municipalities in Uganda. In many other places such as Koboko Municipality, Kabwohe-Itendero Municipality, Rwampara, and Kazo and Kagadi districts, among others, the criterion has been to reward personalities in government for their support of President Museveni.

## Conclusion

While there are many areas deserve to become districts and others that have genuinely been made so, the use of districts/cities as patronage has stood out in most cases and explains the continued proliferation of districts/cities as Museveni prepares to cling on power come 2021. While they are a serious burden to the taxpayer, their continued creation is politically motivated and can only be politically addressed especially by those at the very top who benefit most from it.

# Patterns of Democracies and Participatory Developments: A Matter of Path Dependency?

Brigitte Geissel[1] and Ank Michels[2]
[1]Goethe-Universität Frankfurt, Frankfurt a.M., Germany
[2]Utrecht University School of Governance, Utrecht, The Netherlands

## Synonyms

Consensus democracy; Democratic progress; Democratization; Majoritarian democracy; Participation; Participatory innovations; Trajectories

## Definitions

*Patterns of Democracies* refers to Lijpart's seminal book, in which he identifies two different models of democracy, i.e., consensus and majoritarian democracy. In the majoritarian model, political power is concentrated, whereas, in the consensus model, power is shared, dispersed, and limited in a variety of ways.

*Participatory Developments* are defined as instruments and procedures implemented to increase and deepen citizens' involvement in political will-formation and decision-making.

*Path Dependency* is a concept, which assumes that decisions today can only be understood in light of existing institutions. Path dependency insinuates that institutions change within the frame set by already existing institutions, i.e., that they follow a certain predetermined path.

## Introduction

Democracy is a dynamic, protean concept and a constantly developing reality. Since the 1990s, many democracies have developed in one way or another towards more participatory citizens' involvement and a common trend towards increasing citizen engagement can be observed (Geissel and Newton 2012; Michels 2011; Smith 2009). The introduction of democratic innovations that increase and deepen citizen participation in political will-formation and decision-making is now a common policy of democratic governments.

However, participatory developments are far from consistent. They vary considerably. Some countries prefer direct democratic options, such as referenda. Others opt for fostering public deliberation and dialogue on political issues either by passing specific laws that lay down guidelines for involving citizens or by organizing ad hoc forms of citizens' advisory committees.

## Participatory Developments: Direct Democratic Options or Public Deliberation

Direct democratic instruments found their way into almost all new constitutions of post-socialist

states, and also many established democracies have passed similar laws. Whereas, for example, obligatory referenda have been almost unknown in Europe until the 1990s, today 16 European states have institutionalized them in their national or regional constitutions. Obligatory referenda are, as the word says, not optional, and therefore understood as a check by the people on legislative or constitutional change.

Some democracies took another path and focused on the enhancement of public deliberation, e.g., to provide meaningful consultation for policy-makers. Many governments around the world support public deliberation with different means, for example, by passing respective laws. Some examples illustrate this trend: The British *Department of the Environment, Transport and the Region* set up guidelines for local policy-making at the end of the 1990s requiring citizens' involvement in decisions on local transportation. The French law *Démocratie de proximité* (2002) demands to establish local committees of civil society actors, which should advise local decision-making bodies on specific issues. At the beginning of the 1990s, Hungary introduced a *Minority Self-Government System* and has recently revised it. Finland has passed rules called the *Participation Project* and Sweden revived its *Local Boards*. Other governments support public deliberation by organizing dialogue-oriented procedures and committees. Dialogue-oriented procedures encompass a large variety of forms including citizens' juries, citizens' forums, citizens' advisory committees, minority boards, consensus conferences, civic round tables, and many other forms at all levels of government (local, regional, national).

The question arises whether country preferences for direct democracy versus public deliberation show certain path dependencies, meaning that they are somehow linked to the historically developed type of democracy and its democratic institutions in a country. For example, in consensus-oriented democracies, democratic institutions reflect the idea of sharing visions, rather than counting individual votes. Public deliberation seems well in line with this logic of consensus-oriented democracies. In contrast, majoritarian democracies might tend towards direct democracy, because the tradition of "the majority decides" is more entrenched in these democracies.

## Consensus Democracies and Majoritarian Democracies

Political science provides several concepts to categorize types of democracy; the most well-known is Lijphart's distinction. In his book *Patterns of Democracy* (1999), Lijphart makes a distinction between two models of representative democracy: the majoritarian and the consensus model. In the majoritarian model, political power is concentrated, whereas, in the consensus model, power is shared, dispersed, and limited in a variety of ways. This overarching idea of power concentration versus power sharing is reflected in the institutional architecture of these democratic models. The majoritarian model is characterized by single-party majority cabinets, a dominant executive, a two-party system, a majoritarian electoral system, and a pluralist interest group system. Additionally, the majoritarian model is organized around unitary and centralized government, unicameral legislation, flexible constitutions, no judicial review, and central banks that are dependent on the executive. In the contrasting consensus model, power is shared in broad, multi-party coalitions, multi-party systems, a proportional electoral system, federal and decentralized government, and two equally strong but differently constituted houses. In sum, direct democratic instruments are more in line with the logic of majoritarian democracies (power concentration; the majority decides), and instruments of deliberation and dialogue are in line with the logic of consensus democracies (power sharing).

The first column of Table 1 informs about the classification of OECD countries as predominantly majoritarian or consensus democracy.

## Path Dependencies?

Both consensus and majoritarian democracies have experienced developments towards more citizens' involvement in political will-formation

**Patterns of Democracies and Participatory Developments: A Matter of Path Dependency?, Table 1** Public deliberation and direct democracy scores in consensus and majoritarian democracies

and decision-making. Can the expected path-dependencies actually be identified? To answer this question a variety of countries around the world were examined and the findings are clear-cut (see Table 1): the prevalence of direct democracy or public deliberation in different democracies does not follow patterns along the expected paths.

Consensus democracies do not necessarily tend to solve their political issues in a more deliberative way and majoritarian democracies are not necessarily inclined to make decisions via aggregation of votes in referenda. All sorts of combinations occur (see the second and third columns of Table 1). Consensus countries can be neither deliberative nor direct democratic (the Netherlands); they can score high on public deliberation, but not on direct democracy, they can be very relatively strong considering direct democracy, but weak in public deliberation (Czech Republic); and they can provide relatively high levels of both public deliberation and direct democracy (Denmark). Also, the case of Switzerland, a consensus democracy, illustrates the confusing pattern: Considering public deliberation as well as direct democracy, Switzerland is unambiguously the forerunner. Among all OECD countries it scores best in both fields. With respect to majoritarian democracies, UK as well as Canada – two typical majoritarian countries – do not stand out when it comes to direct democracy. Some majoritarian democracies are neither very direct democratic nor deliberative (Mexico); some

of them are very strong considering deliberative democracy, but moderate for direct democracy (France, Spain, and UK); or moderately strong in both fields (Australia).

Public deliberation appears to be as common in consensus democracies as in majoritarian democracies. Among the most deliberative democracies are majoritarian (UK, USA, Spain, and France) as well as consensus democracies (Switzerland, Sweden, Finland, and Denmark). The most direct democratic countries can be found among consensus democracies (Switzerland, Italy, and Slovenia) as well as among majoritarian democracies (New Zealand, Iceland, and Australia). And the least direct democratic countries can be majoritarian democracies (Canada, Chile, USA) as well as consensus democracies (Belgium and Finland).

## Conclusion

Whether a democracy prefers direct democratic instruments or public deliberation is neither a dichotomous choice nor is it related to the respective type of democracy. Various combinations of models are possible within a country. One can find highly deliberative and direct democratic societies within majoritarian as well as within consensus democracies. There are societies which are neither deliberative nor direct democratic within both types of democracy and likewise deliberative majoritarian democracies as well as direct democratic consensus democracies.

Obviously, the differentiation between the majoritarian and the consensus model of democracy is insufficient to understand participatory developments. Considering these participatory forms of democracy, four models of participatory democracy can be distinguished. There are countries, which are (1) neither deliberative nor direct democratic, (2) both deliberative and direct democratic, (3) more deliberative than direct democratic, or (4) more direct democratic than deliberative. These two typologies are not interlinked, meaning that there is no relation between the dominant model of participatory democracy in a country and the model of representative democracy that predominates in that country. Forms of participatory democracy develop independently from the paths countries have gone to establish the institutions of representative democracy.

# Pay Equity and Performance in the Public Sector

Pierre-Yves Sanséau
Grenoble Ecole de Management, Grenoble, France

## Synonyms

Bureaucracy; Equal pay; Government agency; Pay fairness; Performance-related pay; Public organization

The author thanks Dr Felix Kwame Opoku, University of Cape Coast (Ghana) for his contribution to this chapter.

## Definitions

**Pay equity** Pay equity literally means "pay fairness." The concept of equity implies that one receives proportionally fair outcomes in return for what one invests in a relationship or situation, when comparisons are made with appropriate others (Adams 1965).

**Performance** Refers here to job performance – those scalable actions, behaviors, and outcomes that employees engage in that are linked with and contribute to organizational goals.

## Introduction

Public sector is commonly based on values of equality, integrity, dedication to others, and fairness. So, in most countries, pay equity in the public sector should not be a major issue if it was integrating these values and principles. But pay policies and practices in the public sector bring us to other realities. Historical practices, impact of traditions, economic crisis, lack of resources, and classical managerial approaches highlight the fact that pay equity is a major issue in public sector. In the 1970s, the introduction of new managerial practices related to "new public management" helped us to take stock on two central subjects: pay equity and job performance. Firstly, pay equity was not at all a reality in public service; secondly, job performance became a central issue to save money, to be more efficient, and to move to a real culture of service; and thirdly, pay equity could be related to job performance and not only to gender, age, seniority, or level of qualification.

## Pay Equity

In designing an effective and efficient compensation system, one important factor that management would have to consider is the perceived equity or fairness of the system. In a well-designed compensation system, all employees feel that they are treated fairly by management. Pay equity has been defined as an employee's perception that compensation received is equal to the value of the work performed (Bohlander et al. 2001).

The equity theory (Adams 1963), from which pay equity is derived, is a motivational theory that seeks to determine how employees feel and behave when they are fairly or unfairly treated by employers. Central to the equity theory is the assumption that employees would always compare the fairness of their situations by comparing their input-output ratio with that of relevant others. If they perceive the situation as being unfair in terms of the treatment they receive, they usually would try to restore equity by either altering their inputs or outputs in the right direction.

There are two general classifications of equity: the distributive equity and procedural equity. Distributive equity is defined as the fairness with which people feel they are rewarded in accordance with their contribution to organizational accomplishment. Procedural equity, on the other hand, is concerned with the perceptions employees have about the fairness with which procedures in such areas as performance appraisal, promotion, and discipline are being operated. The perception of inequity compels the individual to experience an unpleasant emotional condition that may cause employees to reduce their future efforts, change their perceptions regarding rewards for their work efforts, or, as often is the case, quit the organization (Adams 1965).

In designing an equitable pay system, management must pay attention to the three forms of equity, namely, the internal, external, and individual equity. Internal equity has been defined as the perceived fairness of pay differentials among different jobs within the same organization. In an attempt to establish internal equity, employees compare their jobs with other jobs. These other jobs may be lower, equal, or higher than the job the employee is performing presently. These comparisons may influence the general attitudes of

employees; their willingness to transfer to other jobs within the same organization; their willingness to accept promotions; their inclination to cooperate across jobs, functional areas, or product groups; and their commitment to the organization (Noe et al. 2006).

External equity has also been defined as the employee's perception of the fairness of their compensation relative to those outside the organization. External equity comparisons are based on what other employees receive for doing similar or the same jobs in other organizations. The management of this type of equity is important because it can greatly influence the decisions of potential employees who often try to compare the levels of employee compensation across various companies before reaching a decision as to which company to work for. It also affects the attitudes and decisions of existing employees with respect to whether they must quit or stay with their present employer (Mello 2002).

Most frequently, employees tend to make equity comparisons by choosing relevant others doing the same job. This is termed individual equity. Individual equity involves employee perceptions of pay differentials among individuals who hold identical jobs in the same organization. Determining individual pay levels and differentials among employees in identical jobs can be done in a number of ways. The most basic is basing pay on seniority. Seniority-based pay systems determine compensation according to the length of time spent on the job or length of time an employee has stayed with the employer. Employee's assessments of equity are, in fact, perceptions; they may be based, in part, on incomplete or inaccurate information, but, nonetheless, these perceptions greatly impact motivation, commitment, job satisfaction, labor relations, and performance.

## Individual Job Performance

The accomplishment of some organizational goal by a single person is often described as "Individual Job Performance." Campbell (1990) defined individual job performance as those actions or behaviors under the control of the individual that contribute to the goal of the organization and can be measured according to the individual's level of proficiency. Job performance may be measured at the individual, group, unit, or organizational level according to quantity or quality of output, creativity, flexibility, dependability, or anything else desired by the organization. But performance at the individual level does not only depend on the amount of time the individual is physically seen doing the work but also the amount of mental concentration that is made available during the performance of the work.

There are three variables which are very important in assessing employee job performance: the requirements of the job itself, the goals and objectives of the organization, and the behaviors that are most valued by management in performing the job. Task activities and contextual behaviors are both important in conceptualizing the job performance of individual employees. Because of the increased attention that is now paid to contextual performance, job performance is no longer assessed on the basis of the tangible activities associated with the production of physical goods and services alone.

As societies are now moving from the physical world to knowledge-based economies, employee perceptions and expectations have expanded. In addition to performing the task, they also can indulge in certain innovative behaviors that can help their organizations to achieve competitive advantage. Contextual performance, such as volunteering for additional work, following organizational rules and procedures, and assisting and cooperating with coworkers and various other discretionary behaviors, is beginning to be viewed as equally important to task performance.

In his famous concept of aggression-approval proposition, Homans (1974) observed that each time an employee happens to receive outcomes in excess of what he or she expected or is given punishment less than what was expected, there is the tendency that the said individual may indulge in approving behaviors which can translate into desirable performance. The satisfaction that goes with the excess rewards or less punishment results in an emotional state that voluntarily

directs the behavior of the person toward organizational objectives.

## Perception of Pay Equity and Performance

Employee's perception of what is equitable may have significant effects on his or her work motivation and performance (Adams 1963). This implies that managers who have the desire to encourage employees for maximum performance would have to carefully develop equitable pay structures so that pay differences among individuals with different levels of experience and performance can be reduced to the bearable minimum. The traditional practice of designing reward systems and imposing them on employees does not allow employees to understand the system, let alone to perceive it as equitable. Though it is believed that the top-down process of designing employee compensation may ensure consistency in the system, this practice is likely to compel employees to perceive the system wrongly. Consequently, they would be more likely to develop negative perceptions about management and the system, and this may cause employees to indulge in counterproductive behaviors.

The compensation system can influence employee behavior when there is a correlation between rewards and performance. The perception of equity in the compensation system often depends on employee comparisons. These comparisons, which are based on employee perceptions, may be factual or otherwise, as few employees really have concrete information about the situation of their comparison others.

Another aspect of equity which is based on employee perception relates to whether or not the system is open to or hiding from employees by management. Pay information that is kept secret in closed systems does not allow employees to make more accurate equity comparisons. Advocates of the open pay system believe that the system promotes equity and motivation. In their opinion, to the extent that high-performing employees are known to be making more money than low-performing individuals, it follows logically that people throughout the organization will be motivated to work harder under the assumption that they too will be recognized and rewarded for their contributions. However, critics of pay openness argue that what an individual gets paid for is his or her own business and not for public consumption. They also underline that if pay levels are made known to everybody else, then jealousy and/or resentment may result.

In the past, human resource managers viewed employees as factors of production that were employed to produce the needed goods and services for profit. During that time, pay and other monetary factors were considered as the best way to motivate employees for maximum performance. Based on the Hawthorne studies which were conducted by Elton Mayo between 1924 and 1932, some managers began to realize that employee performance was affected more by psychological and social factors rather than physical or objective influences.

Employers have a duty of energizing employees to work harder, more efficiently, and intelligently. This requirement is true of any manager of any organization as long as that manager is engaged to work with others to achieve group goals which do not only depend on the ability of the employee to perform specific jobs but also on the willingness and commitment of employees to initiate, direct, intensify, or sustain constructive behaviors.

Herzberg et al. (1959) discovered two forms of motivation: the intrinsic motivation and the extrinsic motivation. Intrinsic motivation depends on the personal factors that induce an individual to behave in a particular way: responsibility (feeling that the work is important and having control over one's own resources), autonomy (freedom to act), scope to use and develop skills and abilities, interesting and challenging work, and opportunities for advancement. Intrinsic motivation is likely to have deeper, enduring, and longer-term effect because they are inherent in the individual and not imposed on him.

Extrinsic motivation originates externally. It relates to rewards that are given by another person, typically a manager, and include promotions,

pay increases, and bonuses. Although extrinsic motivation is important, good managers strive to help employees achieve intrinsic motivation as well. In his opinion, the most talented and innovative employees are rarely motivated exclusively by rewards such as money and benefits or even praise and recognition. Instead, they seek satisfaction from the work itself. People are energized by the psychic rewards they get from working on intellectually stimulating and challenging technical problems, as well as by the potentially beneficial global impact of their work.

An understanding of employee motivation has become even more critical due to the rapidly changing nature of organizations in recent times. Organizations in the public sector are becoming global and are shifting from traditional hierarchical structures to decentralized structures and adopting the concept of teams. These changes, along with the trend of downsizing and a shift to performance, have resulted in employees harboring higher levels of anxiety which have great impact on the employee at the workplace. In fact, motivation affects almost all major aspects of the organization, including satisfaction, performance, organizational commitment, job design, benefit programs, and job involvement.

Managers trying to enhance the motivation of their employees can draw on any of the three main theories of motivation (content, process, and reinforcement). In applying these approaches, however, managers must understand that there are approaches to motivating people that are destructive, for example, fear and intimidation. While these approaches may seem very effective in promptly motivating people, they hurtful, and in addition, they usually motivate employees for only the short term. There are also approaches that are constructive, for example, effective delegation and coaching. It is also important to note that different people can have quite different motivators, for example, by more money, recognition, promotions, or opportunities for learning. Therefore, when attempting to motivate people, it is important to identify what actually motivates each of (Vroom 1964). Motivation is clearly a major key to performance.

## Conclusion

Managing performance of employees in the public sector is a central issue in most countries. New public management (NPM) approaches had among its main goals to revisit managerial practices in the public sector, and pay equity was one of (Arnaboldi et al. 2015). But some limitations have been finally highlighted as NPM implementation had also specific and potentially negative psychosociological and organizational effects: increase of stress; illness; low morale; decline in job satisfaction and motivation; fear; competitive, adversarial, and punitive ethos; distrust between people and an invisible net of managerial power and domination; and over-bureaucratic and expensive audit procedures (Diefenbach 2009). If pay equity is still a positive and central objective in public sector management, it is may have been altered by the side effects of NPM. The new performance approach seems to have deeply modified the stakes and has also brought more complexity, more uncertainty, the introduction of new technologies to measure performance based mainly on budgetary indicators, the introduction of private sector tools in non-adapted organizations, a misunderstanding of what was management and the new role of the managers, etc. Therefore, pay equity will remain a major concern in the coming years as public sector will stay a changing sector in fast-changing contexts.

# Pay for Performance in Government: The Case of South Korea

Yujin Choi
Department of Public Administration, Ewha Womans University, Seoul, South Korea

## Synonyms

Performance-based pay (PBP); Performance-related pay (PRP)

## Definition

Pay for performance refers to a system of employee payment that links individual pay to measures of individual performance.

## Introduction

This paper discusses the features of the pay for performance (PFP) system in the Korean government. With the New Public Management (NPM) initiative, governments worldwide have adopted innovative approaches from the private sector to enhance performance in the public sector. To survive the Asian financial crisis in 1997, South Korea (hereafter referred to as Korea) has also implemented various administrative reforms to increase competitiveness and reduce inefficiency in the public sector. As part of these efforts, the Korean government has implemented a wide range of performance-based management systems, including evaluation of government performance and personnel management.

Enhancing government performance requires improving the performance of individual officials. Before the financial crisis, most organizations in Korea employed a pay system based on seniority. Because salaries automatically increased in accordance with the length of tenure, the pay system did not function as an incentive for better performance. The Korean government first introduced the PFP system to ministries of central government in 1999 and to local governments countrywide in 2001. This system was considered as a core tool to produce a more performance-oriented government (Hur 2012; Han 2010). Continued efforts have been made to strengthen performance-based personnel management by expanding the scope of eligibility for the PFP system and increasing the percentage of performance-based pay. In December 2015, the Ministry of Personnel Management announced the Reform Plan for Job-and-Performance-Based Pay System to better align rewards with performance. The Ministry of Personnel Management Operation Plan of 2017 also proposed a phased expansion of performance-based annual salary. While the performance-based annual salary scheme was applicable to only Grade 4 (director) or higher in 2015, it was expanded to Grade 4/5 director level (multiple positions) in 2016. From 2017, it further applied to Grade 5 (deputy director level) or higher in the General Service and Special Administrative Service.

This chapter is partly drawn from my earlier work, Performance-Related Pay in Government: Present Challenges and Suggestions for the Future, *Korean Public Personnel Administration Review*, *16*(1), 75–102 (in Korean).

This paper provides an overview of the pay for performance (PFP) system in the Korean central government. Since this paper introduces the case of South Korea, it is descriptive in nature. The PFP system has come to affect not only government officials but also those in public institutions and local public enterprises in Korea. In addition, this case might spark a discussion on the adaptation and utilization of PFP systems in non-Western countries. Given that the implementation of PFP has wide-ranging consequences, it is meaningful to review and understand the current status of Korea's PFP system. The next section discusses the Korean central government's performance evaluation system for public officials and the types of PFP schemes currently in use. The challenges and future issues to consider follow in the conclusion.

## Current Pay for Performance Scheme in Korea

Pay for performance (PFP) refers to compensation determined based on job performance at the individual or organizational level (Oh 2013). Pay for performance as a performance-based personnel management scheme was adopted to motivate employees to improve organizational performance (Yu and Park 2014). Increased performance is ultimately relevant to the efficient use of tax revenue and the provision of improved public services to citizens (OECD 2012). In general, PFP plans can be delineated into four types, as shown in Table 1.

This section briefly reviews the performance evaluation system in Korea because the PFP system operates in conjunction with the performance evaluation system. The results of each public official's evaluation factor into rewards under the PFP system. The central personnel authority provides the general guidelines for the performance evaluation system and PFP arrangements. The PFP arrangements are defined in the Decree of Compensation for Civil Servants and the Decree of Allowances for Civil Servants (Kim 2014). There are two types of individual-level performance evaluation systems in the Korean government: performance agreement for higher-level officials and general performance evaluation for middle- and lower-level officials, as shown in Table 2.

The performance agreement system applies to public officials of Grade 4 or higher, including senior civil servants. This system annually evaluates a manager's individual and departmental performance, job-related credentials, and competence. After setting performance goals and indicators through consultation with an evaluator, the public official signs the official performance agreement regarding individual and department duties. The official's performance is evaluated based on this agreement, and the results of the evaluation are reflected in personnel management, including performance-related pay and promotion (MPM 2019a). Since "the nature of the performance agreement might vary depending on the type and task of the organization, this is an individually-specific performance agreement along with strategic goals in a given organization" (Kim 2014).

The general performance agreement system applies to public officials of Grade 5 or below. This system is a biannual evaluation regarding work performance and job competency. After setting performance targets, the evaluator has a face-

to-face interview with the official, periodically checks and records the status of work done, and finally evaluates the official based on the results. The results of each official's performance evaluation are used in promotion screening and grading for performance bonuses, and they are also used in HR operations, such as job transfers and educational training (MPM 2019a).

As shown in Table 3, there are two forms of PFP schemes in Korea: performance-based annual salary and performance-based bonus. Government employees Grade 5 and higher and SCS members are paid a performance-based annual salary that accumulates each year and is added to the base salary. Government employees Grade 6 or below are paid a performance-based bonus as a lump-sum at least once a year. The performance-based annual salary scheme falls under the category of merit plans, and the performance-based bonus falls under the bonus category in Table 1 (Lee 2011; MPM 2019b). In the following section, the types of PFP schemes are explained according to the level of the eligible government official.

| Grade 4 and above including members of the Senior Civil Service (SCS) | Performance agreement system |
| Grade 5 and below (middle- and lower-level officials) | General performance appraisal system |

Source: Kim (2014, p. 14)

### Performance-Based Annual Salary for Senior Civil Service (SCS)

The performance-based annual salary scheme is applicable to members of the Senior Civil Service (SCS). The SCS includes Grades 1 through 3 in the career service excluding minister- and deputy minister-level political appointees. The salary structure of the SCS includes base pay plus performance-based pay. The base salary is comprised of the guide rate (base rate calculated by personal career background and cumulative performance) and job pay (calculated by the difficulty and accountability of the job based on job level (Level A (*Ga*) and B (*Na*)). (The SCS has two job levels (Levels A (*Ga*) and B (*Na*)).) In 2019, the minimum base pay is 66,498,000 won (about 58,490 USD), and the maximum base pay of SCS members is 103,312,000 won (about 98,870 USD).

Performance-based pay depends on the evaluation grade, which has four ratings (S, A, B, and C). The performance grades and pay rates are shown in Table 4. The amount of performance-based pay for individual SCS members is determined by multiplying the standard amount of performance-based pay by the pay rate corresponding to the individual's performance evaluation grade from the previous year. In 2019, the standard amount of performance-based pay for Level A (*Ga*) is 110,409,000 won (about 97,120 USD), and for Level B (*Na*) it is 95,480,000 won (about 83,980 USD). For example, if someone at Level A (*Ga*) receives Grade S (Excellent), the amount of his/her performance-based pay is 19,874,000 won (about 17,480

USD). No performance-based pay is given to SCS members with Grade C, as shown in Table 5. Performance-based pay is determined in February and paid in monthly installments.

## Performance-Based Annual Salary for Public Officials on Grade 5 and Above

The performance-based annual salary scheme applies to government officials on Grade 1-(equivalent)–Grade 5 (equivalent) in General Service (including government officials engaged in public security, etc.) and Special Administrative Service, public officials abroad (excluding military officers abroad), and military personnel. This scheme also applies to police (from Chief Superintendent General to Superintendent) and firefighting service personnel (from Deputy Fire Commissioner to Assistant Fire Chief); research officers among the research service personnel; instruction officers among agricultural officers; professional career officers (Level A (*Ga*)); the faculty of national universities (excluding the head of the university); and fixed-term government officials (excluding temporary government officials).

The performance-based annual salary is comprised of a base salary and performance-based pay. The base salary consists of base pay plus allowances for regular attendance, management tasks, and public holidays. The performance-based pay is paid at differential rates by the employee's performance evaluation results from the previous year. The total annual salary is limited to the upper and lower limits within each rank.

Table 6 indicates the proportion of employees and pay ratio for each performance grade. However, since 2017, the minister in charge may use discretion in allocating performance-based pay to individuals who hold select positions on Grade 4 or lower or government officials in the Special Service. The minister may exercise one of the following options: differential payment by individual, equal payment by individual after differential payment by department, combination of differential payment by individual and by department, or differential payment by individual after differential payment by department.

The following scenario describes the payment procedure. For example, an evaluation (e.g., performance agreement) is completed on December 31, 2018. The performance-based annual salary is calculated according to the result of 2018 performance evaluation. That amount is added to the annual salary amount to be paid for 2019. That is, the base salary in 2019 will be the base salary in 2018 plus performance-based pay earned in 2018.

## Performance-Based Bonus

As of 2019, the performance-based bonus applies to government officials on Grade 6 or lower levels. This bonus is granted annually based on the results of each official's performance evaluation. Unlike performance-based annual salary, the

Source: 2019 Guidelines on Government Employee Compensation

performance-based bonus is a one-time event that is not incorporated into base pay. If the minister in charge considers the characteristics of the work and occupation, performance improvement of the organization, and employee motivation effects, the bonus can be paid more than twice in a year. This bonus is usually paid as a lump-sum, but the bonus can be divided into several months after collecting opinions from affiliated employees if the minister thinks it is necessary (MPM 2019b).

The minister in charge may consult with affiliated employees and choose the most appropriate method to pay the bonus to employees, considering the characteristics of the work and employees. Bonuses can be paid in the following four ways: (1) differential payment by individual, (2) equal payment by individual after differential payment by department, (3) combination of differential payment by individual and by department, and (4) differential payment by individual after differential payment by department. In addition, the minister may set the payment method differently for each department by collecting opinions from affiliated public employees. The minister in charge may also arrange for the performance-based bonus to be paid using a different method other than above by consulting with the Minister of Personnel Management (MPM 2019b).

### Differential Payment by Individual

Performance-based bonus on an individual basis at a differential rate is the most common form of payment in the Korean government (OECD 2005). This is paid by evaluating individual performance based on an employee's rank and occupation category. The amount of performance-based bonus is calculated as performance pay rate multiplied by base pay. The pay grades and ratios are shown in Table 7. Employees with Grade S (top 20%) receive 172.5% of their base pay. Employees with Grade A get 125% of their base pay, and employees with Grade B get 85% of their base pay. 10% of employees who belong in the bottom rank with Grade C receive no performance-based bonus. The minister in charge can pay over 172.5% to excellent performers who receive Grade S, or it is possible to add Grade SS or SSS above Grade S. If necessary, the minister may set the pay rate and grade differently, budget permitting.

### Equal Payment by Individual After Differential Payment by Department

When the performance of individuals is difficult or inappropriate to evaluate due to the necessity of departmental or organizational systemized shift work, performance-based bonuses can be paid by individually equal payment after departmentally

differentiated payment. This means that "performance-based bonuses will be paid evenly based on rank within the department, while each department might have a different amount of bonuses" (Kim 2014).

The performance evaluation criteria for each department are set by the respective ministers. The minister determines department pay rate and grade in consultation with the central personnel authority, but it should satisfy the following criteria: (1) there should be 3 or more pay grades; (2) the pay rate gap between pay grades should be as even as possible, but the highest grade pay rate should be more than 1.5 times the rate of the lowest grade (except in the case where the lowest grade of pay rate is 0%); and (3) the department ratio by pay grade should be set to achieve a normal distribution, and the proportion of particular pay grade should not exceed 60% of total.

### Combination of Differential Payment by Individual and by Department

Performance bonuses can be allocated through a combination of department and individual bases. A part of the budget for performance-based bonuses (which cannot exceed 50% of the total budget) is differentially paid according to each department's performance level and then equally paid by individuals within the department. The remaining budget is paid based on individual performance appraisals. The payment methods for department and individual follow the procedures described above.

### Differential Payment by Individual After Differential Payment by Department

After performance-based bonus is paid differentially by department, the amount of this bonus is allocated to individuals based on the result of individual performance appraisal. There are several criteria for departmentally differentiated payment: the number of pay grades should be 3 or more, the pay rate difference between pay grades should be more than 10%, the department ratio by pay grade should be normally distributed, and the proportion of single pay grade should not exceed 60% of the total budget.

## Conclusion

This paper examines the PFP system in the Korean central government. Although the content and scope of PFP systems vary from country to country, more than two-thirds of the OECD member countries link performance evaluations and pay in the public sector. Korea is the second highest country among OECD members to use PFP (OECD 2012). As discussed, the Korean government has been making efforts to establish and utilize the PFP system. However, a considerable number of domestic and international studies have indicated various theoretical and practical problems associated with PFP. There are relatively few empirical studies that analyze the effectiveness of the PFP system, but prior studies on PFP in the Korean context have diagnosed problems with the PFP implementation. These include overemphasis on monetary rewards and short-term results, controversy over the fairness of the performance evaluation, and discordance between individualized compensation and collectivist culture (Choi 2017). Considering the ubiquity of performance management in Korea, performance-based personnel management with pay flexibility is difficult to reverse (Kim 2014). Many questions still remain, and more research is needed to minimize the negative effects and settle into a more effective system.

# Peace and Governance

Md. Jahidul Islam
Department of Public Administration,
Stamford University, Dhaka, Bangladesh

## Synonyms

Individual and Peace; Institutions and Peace; Nations and Peace; Peace and Governance

## Definitions

**Peace:** Peace is defined in two senses: *Positive Peace* and *Negative Peace*. Positive peace refers to the absence of structural violence, which includes exploitation, hunger, malnutrition, corruption, and so on. On the other hand, negative peace is defined as the absence of direct violence like interstate war, civil war, and injury (Galtung 1969).

**Governance:** Governance refers to "the exercise of authority to implement rules and policies in an effort to bring order to social, political, economic, and judicial processes that allow a society to develop" (Snodderly 2011).

## Introduction

Peace is a holistic phenomenon and need to comprehend from different perspectives. Erasmus said so long ago that "peace is the mother and nurse of all that is good for humanity" (Gittings 2015). Human society has passed through three stages of knowledge. August Comte, one of the founding fathers of sociology states that human society passed through three stages of knowledge including the theological, metaphysical, and positivism. In the theological stage, all things were explained following the religious aspects. In the metaphysical stage, human largely rely on the philosophical understanding of the phenomena. In the latest stage of positivism- which refers only to the observable phenomena- social science is the latest science in this regard (Giddens and Sutton 2013).

Moreover, study and analysis of peace in social science is also a new trend in modern academic area. Therefore, conceptualization of peace from these three stages of knowledge is an integral issue. Otherwise, there will be an obvious gap to conceptualize peace. Jeong (2000) argues that "the concepts of peace have been rich in content across various religious and philosophical traditions. The search for inner and communal peace derives from the ideal sought in spiritual life." This paper is intended to discuss the conceptual issues regarding peace, and it will also analyze the relationship of peace with governance from different perspectives and levels. The following part will discuss the concept of peace from three perspectives: theological, philosophical, and modern.

### Theological View of Peace

According to religious view, peace is divine and eternal. But all major religions emphasize on justice, equity, nonviolence concerns for the well-beings of others, well-ordered state of mind, inner peace, compassion among living beings,

and equanimity. Buddhism sees *Nirvana as* the highest and ultimate place of peace and happiness where all sufferings end, and Buddha said "peace begins when all suffering ends" (The Teaching of Buddha 1966). *Vedic* religion also emphasizes on peace in its original texts. Bible and Old Testament show the "message of mutual good will, unconditional love, wholeness and individual well being as well as cessation of enmity. In early Christian social utopia, there was a strong emphasis on a community of love. Harmony and fullness can be achieved by spiritual enlightenment" (Jeong 2000: 7–8). In Islam, killing of an innocent person is equivalent to the killing of the whole humanity, and it strictly prohibits creating anarchy on the earth.

### Philosophical View of Peace

From the philosophical perspectives, the concept of peace is associated with justice, order, lack of civil disturbance, absence of military war, social contracts, and rights of sovereign state, social and political justice, and so on. Greek philosopher describes a "peaceful world" as the absence of "civil disturbances." These philosophical traditions linked to unity based on moral substance of humanity and principles of world citizenship in each individual." In the Hellenic civilization, the vision of peace was intended to a world free from all types of war. Peace was considered as the control of organized violence during Medieval Periods through harmonious relationship among social units. During the period of Enlightenment, political philosophers like John Locke and Jean-Jacques Rousseau considered war as avoidable through establishing "social contracts." Liberal reformist argues for institutionalization to prevent interstate warfare. In addition, Kantian philosophy laid the foundation of the rights of sovereign nation-states through treaties and international agreements and proposed several principles to refrain states from intervening in the affairs of another states. Moreover, anarchist thinkers like Tolstoy opposed the state institution arguing that state power is responsible for violence, oppression, and exploitation. Marxist's argues that peace could be attained in a classless society through revolution and see class struggle and exploitation as intrinsic phenomena in the capitalist economy, which is great barrier for greater equality among people (Jeong 2000: 7–9).

The great Muslim philosopher Imam Gazzali in his famous book "Counsel for the King" argues that "justice is the only instrument upon which prosperity of a kingdom depends. The society which is more developed and prosperous and people livings under happiness depends upon the practice of justice of ruler" (Issacs 1964). In addition, Plato said that justice is the most fundamental basis of ordered social life (Plato cited in Ibeanu 2006).

Chinese Philospher Lao-Tzu argues against the use of military force. Confucius states peace is the ultimate vision of human which come from "social harmony and equilibrium." Another Chinese philosopher Mo-Tzu radically argued position against war and mentioned love as the human virtue. He said that "those who love others will be loved in return. Do good to others and others will do good to you. Hate people and be hated by them. Hurt them and they will hurt you. What is hard about that?" (Barash and Webel 2012).

Gandhian view was that violence may not be a way of peace; rather peace should be achieved through peaceful way. Gandhi was influenced by major religious teaching including Christianity, Buddhism, Islam, and Jainism and invented the essence of *sattyagrah*. He mentioned about few principles including *sattyagrah* – "adherence to truth" or "commitment to truth," *Maya* – love, *Vaktiayga* – reverence or respect, and *Ahimsa* – nonviolence (Gandhi 1983). Ambler made a comprehensive study on "Gandhian Peacemaking" from Western point of view and identified four principles of Gandhian view of peacemaking which includes: understanding the conflict, confronting the opponent, confronting oneself, and building confidence. In addition for successful peacemaking process, more important issues should be kept in mind which are: "making study of the other's view point, rejecting to embarrass the opponent, accepting compromise rather than defeat, winning at a pace that all can follow and becoming more independent in practice" (Ambler 1990: 199–205).

### Modern View of Peace

Apart from the religious and philosophical contexts, peace is no longer a utopia in modern thinking; rather it is a goal which can be attained following conscious efforts to "build a harmonious social order" (Jeong 2000: 9). Aron, the French intellectual firstly used the terminology of peace as the reduction of war in international relations (Barash and Webel 2012). But, Galtung (1996), a pioneer Norwegian peace researcher argues that peace is more than the absence of violence and to discuss the idea of peace we should start keeping three simple principles in front of us: "(i) The term peace shall be used for social goals at least verbally agreed by many, if not necessarily by the most; (ii) These social goals may be complex and difficult, but not impossible to attain; (iii) The statement peace as absence of violence shall be remained as valid." He also states that there is a relationship between the term peace and violence in such a manner that "peace can be regarded as the absence of violence." In addition, Galtung states that "violence is being present when human beings are being influenced so that their actual somatic and mental realizations are below their potential realizations." He also distinguished between physical and psychological violence, negative and positive approach, having actor (direct violence) and without actor (structural violence), and intended and unintended violence.

Moreover, to define peace, Galtung states that peace and violence is the opposite side of a single coin. He distinguished between personal and structural violence. He argues that peace is the absence of direct and structural violence. Absence of direct violence called *negative peace* and absence of indirect violence is called *positive peace*. Personal or direct violence includes killing, genocide, and injuring. On the contrary, structural violence refers to the violence which "is built in the structure of society and shows up an unequal power and consequently an unequal life chances" like unevenly distribution of resources, health care facilities, national budgets, and so on.

Rumel (1981) states peace as the opposite of war. He conceptualized peace in positive term at different level. At social level, he states that "peace as a social contract occurs at different levels of social relationships" including international, state, group, and individual level. Jeong (2000) States that the notion of "ecological peace" from tribal communities means that the earth itself is the object of violence.

There are few theoretical traditions of peace. For example: the democratic peace theory, which states that democratic countries are less likely to engage in war with each other (See, Reiter 2015). Another theoretical aspect of peace is the game theory and balance of power theory. Boulding (1990: 3–5) cited an example of peace theory "involving a dynamic movement towards a possible equilibrium is the theory of arms race," Another aspect of peace theory he mentioned is the "study of the impact of the different kinds of destructive powers of weaponry on the consequence of using them."

Thus modern thinking on peace and theoretical tradition consider peace as the absence of direct and structural violence. Absence of direct violence like interstate war, civil war, and injury refers to negative peace and absence of structural violence like exploitation, hunger, corruption, malnutrition, etc., as the presence of positive peace. Thus, peace is a situation of stability and freedom where everyone is free from exploitation and marginalization: no one exploits other and is not being exploited by anyone else.

## The Correlationship Between Peace and Governance

The issues related to peace are issues related with governance. There are mechanism of negative peace and positive peace. Issues related with negative peace includes diplomacy, negotiation, mediation, conflict resolution, peace through strength, disarmament and arms control, international organizations, international law, world government, ethics and religion. On the other hand, mechanism of positive peace includes ensuring human rights, ecological well-being, economic well-being; nonviolence and personal transformation. In addition, good governance includes few mechanisms including accountability, transparency, rule of law,

responsiveness, equity and integration, effective and efficient, and wider participation in decision-making process (Good Governance Guide 2017), which are highly linked to the economic and social development of a country. There can be no peace without proper governance. Peace requires stability and freedom; justice and equity; absence of organized violence; social and communal harmony; interstate state, regional, and global peaceful relationship among states; prevention of crimes, terrorism, and conflicts; and so on. These are elements highly liked up with governance of different institutions including local to global and formal or informal. So, this section discusses the relationship between peace and governance at national, global, regional, and individual level, and it also analyzes how intuitions of different levels work to promote peace.

## National Governance and Peace

One of the primary responsibilities of governance activities of states or governments is to ensure peace and security to prevent direct violence and structural violence. Galtung (1969: 168) rightly argues that "peace action is regarded as highly as the action against violence," then the action must be highly linked with the governance activities and prevention of violence and terrorism is considered as one of key indicators of governance at state level (Kaufmann et al. 2010). In addition, governance is related with institutions to achieve certain objectives. For example, parliament plays certain role according to the constitution of a country. Judiciary plays role to ensure justice as per as the laws of the land. Police work to ensure security for people and to prevent crimes and violence. Military forces work to secure territorial integrity and sovereignty of a state, and public administration work with a broader goal to ensure development and to promote peace. One of the goals of Sustainable Development Goals (SDG) is the vision for peace, justice, and stronger institution, which is related with public service and good governance of states institutions.

Democratic practices, wider participation of citizens at the decision-making process, ensuring human rights and establishing rule of law foster to promote good governance and stability and order in a state, and these are possible through successful functioning of institutions. Political, economic, and social integration is necessary in a state to tackle marginalization and exclusion. Exclusionary policies of government against political opponent and ethnic groups can foment civil unrest and violence. Sometimes, state institutions cannot work with a broader vision of integration rather follow the policy of segregation and separation and use police and law-enforcing agencies against own people and state which become an instrument of violence. If state institutions fail to work properly, then violence, conflicts, and anarchy are obvious consequences. Failure of institutions: political or social or economic results in chaos and disorder. There could have numerous reasons behind the failure of governance including corruption, foreign invasion, sectarian conflicts, political instability, civil war, economic crisis, and so on. But, whatever the reasons of governance failure, the ultimate result is anarchy and violence which is the opposite of peace and stability. The examples of Iraq, Afghanistan, Libya, Somalia, and Syria are best examples in front of us how these countries are beset with civil war and terrorism because of the collapse of institutions and governance.

However, national government of many countries successfully managed their internal conflicts. For example, the two-decade long insurgency in Chittagong Hill-Tracts (CHT) region of Bangladesh was ended following a peace accord in 1997 between the government and the insurgents' organization. Previously, conflict in Northern Ireland and South Africa, which happened basically based on political, economic, and psychological division was successfully resolved (Jeong 2000). Instead of all out war and violence in some part of the world, Scandinavian countries, Europe, and North America is quite stable except few terrorist attacks. Boulding (1990) states that "we have seen in the last 150 years a new phenomenon, the development of stable peace between independent national states, in which neither of two countries has any plans to go war with each other. This begins in Scandinavia in the mid-nineteenth century, spread to North America by about 1970, and to Western

Europe after the Second World War." He also argues that "the condition of stable peace is fairly simple: both parties must take national boundaries off their agendas, except by mutual agreement; both parties have to have a minimum amount of intervention in each other's affairs.

Ensuring justice in all aspects of an individual life is an important precondition of peace. In modern time, it lies as the responsibility of government and state. Weber (2015) argues that there is no peace without justice. Imam Gazzali states that "royal justice, on which depends the prosperity of the subjects. It appears to mean conscientious rule. Injustice is divided in two categories: which sultans to do with subjects, strong men to weak and rich men to poor; and that which men do to themselves, namely sin. God inflicts punishment in this world upon perpetrators of injustice and God accept penitence and rewards kindness" (Isaacs 1964). It is the responsibility of government and state to ensure justice at all level and should be started from the top of the society. As he continues, if ruler become just then subjects practice justice, if ruler is unjust, then the same is followed by subjects. So, justice depends upon ruler, the powerful group of the society primarily. In addition, Plato discusses justice in the "social context as the most fundamental basis of ordered social life. For him justice is the basis of peaceful social existence. He defines justice as giving each to his/her due. He argues that every society requires three functions to achieve harmony (peace): production, security and political rule. All these things related with the governance of modern nation state." (Plato cited in Ibeanu 2006).

## Global Governance and Peace

Global governance is a concept to regulate global challenges the nation's states facing today from the spread of diseases to transnational terrorism and crimes. It is not possible for nation states to control the things like the spread of AIDS. Global governance is a concept "that aims to capture all those rules and norms, policies, institutions, and practices through which global humanity orders its collective affairs." In this sense, global community has some regulations like international law, multilateral treaties, and norms of conflict resolution alongside institutions like United Nations, the International Monetary Fund, and World Bank (Giddens and Sutton 2013).

International Organization like United Nations after the failure of the League of Nations following the Second World War was established to save succeeding generations from the scourge of war. Though, there are widespread criticism about the legitimacy and failures of the organization, but its success stories shows effective initiatives to stop the Korean War in 1953 through the "Uniting for Peace" resolution in its General Assembly and successful negotiation initiative to stop India-Pakistan war (Gareis and Varwick 2005).

United Nations has two types of methods to resolve any disputes which endanger or threat to breach international peace and security: *peaceful mechanism and coercive mechanism*. Peaceful mechanism includes "negotiation, enquiry, mediation, conciliation, arbitration, judicial settlement, resorting to regional agencies or arrangements, or other peaceful means of the parties." Moreover, in case of the failure of pacific measures of settlement of disputes, the Security Council decides to take coercive measures analyzing the level of threat and acts of aggression. "These may include complete or partial interruption of economic relations and of rail, sea, air, postal, telegraphic, radio, and other means of communication, and the severance of diplomatic relations." In case of inadequacy of these measures, the organization can take military action through air, naval, and land forces by its member nations to restore international peace and security (United Nations 2016). The military intervention of United Nations in Libya against the Colonel Muammar Gaddafi on the basis of the gross violation of Human rights raised serious questions, whether its intervention promoted peace in Libya or forced the whole region for protracted sectarian conflicts including the safer heaven for terrorist organization like Islamic State.

The organization is operating peace keeping missions in 16 countries through the world by its Department of Peace Keeping Operations (DPKO). Peacekeeping Missions are working to maintain peace and security, to prevent conflict

and mediation, peacemaking, and peace enforcement. In broader sense, peacekeeping operations are in principles working "to support and implement of ceasefire or peace agreements and peace building activities." Moreover, today's multidimensional peacekeeping operations are working "to facilitate political process including democratic transition, protect civilians, assist the disarmament, demobilization, and reintegration of former combatants, support the organizations of elections, protect and promote human rights and assists in resorting rule of law" (UN Peacekeeping 2017).

Apart from the negative aspect of promoting peace, United Nations had taken vigorous initiatives to promote culture of peace through UNESCO's Culture of Peace program and declared the decade of 2001–2010 as international decade for a culture of peace and nonviolence for the children of the world. The culture of peace is a "set of values attitudes and modes of behaviours and ways of life that reject violence and prevent conflicts by tackling root causes to solve problems through dialogue and negotiation among individuals, groups and nations." For peace and nonviolence to prevail, culture of peace program includes: fostering culture of peace through education, promoting sustainable economic and social development; promoting respect for human rights; ensuring equality between men and women; fostering democratic participation; overcoming enemy image through understanding, tolerance, and solidarity; free flow of information and media, promoting international peace and security (UNESCO 2016). Achieving the objectives of the culture of peace, many government and nongovernmental institutions need to work together side by side other international organizations.

## Regional Governance and Peace

In spite of the challenges and limitations of International Organization like United Nations, political and economic integration through regional institutions like European Union make any future war impossible among the previous rivals like Britain, France, and Germany. It is even difficult to think for today's generations that those powers fought two major world wars (Friedman 2010). European Union emerged as the supranational regional entity which merged the European countries like a borderless zone and created a single market with single currency. Thus, it is maintaining the stability, promoting peace and development for the region, and playing vital role in world politics. In addition, African Union, Arab League, Organization of American States, Association of South-East Asian Nations (ASEAN) also playing dominant role in their respective region and working for economic and political integration. Thus, regionalism has been emerged as a regional governance mechanism which can prevent regional conflict and to combat transnational crimes and terrorism.

## Personal Governance and Peace

How to achieve peace at personal level? There are two aspects of a human being. One is physical and another is mental, sometime nonphysical aspects refers to the activities regarding to soul or mind. Thus, the physical aspects of peace is concern with the absence of violence in negative term and absence of structural violence like exploitation, hunger, malnutrition, and other negative instruments from the social aspects. Sometimes, social peace like the complete absence of war, violence and confrontation, and sometimes direct exploitation do not indicate that an individual is living in peace or she/he is feeling happiness. Rather, they can feel anxiety and mental affliction. Thus, the second approach of mental or psychological or soul related happiness is absence in the direct materialistic academic discourse. A rich man can suffer from mental affliction, even who do not face any direct or indirect violence. Thus the answer of this question is not given from the modern perspectives of peace.

Hate bring mental affliction and destroy the peace of mind. If a man hates another one, who is closer, then the result is absolute mental affliction and lost happiness or at least suffers from anxiety. For example, an accidental divorce after 12 years of living together between a male and female can cause serious mental affliction and

psychological disorder. On the contrary, love brings peace in mind. The meaning of love is to seek well-being of others without resorting to any return or exchange for that. Thus, love and lust is not the same thing. Love requires sacrifice. Love does not require or justify any retaliation, rather it is a sacrificial matter which is purely one sided.

War starts in mind first and its manifestation is bombardment. We talk about the absence of direct confrontation, but we have no programme to keep the leadership psychology in a pacific situation who always will think in a positive direction. Two boys may fight with an apple. But, they donot get the lesson to share with each other and surviving together. The phrase of the Constitution of UNSECO (1945) rightly mentioned that "since war begins in the minds of men, it is in the minds of men than defences of peace must be constructed" (UN General Assembly Resolution, A/RES/53/243 1999). Greed for resources and power destroy peace at all level including the individual's state of mind and people fight with each other to establish control over resources. It happens because of the greed for resources and lack of willingness to give everyone his/her due. It requires the practice of justice at personal level. Rabea Bosri, a pious female Muslim women wrote rejecting her offer for marriage from an affluent businessman that apathy or lack of interest for worldly resources results peace in soul and bodily pleasure, but fascination or greed towards resources cause sorrow and unhappiness (Gazzali 2009).

## Conclusion

Peace and governance is highly linked with each other. There will be no peace without proper governance. Peace is a violence free condition which is marked by the absence of all forms of violence including interstate war, civil war, genocide and ethnic cleansing, economic exploitation, and political marginalization or exclusion based on different ethnic or religious identity, corruption, hunger, and so on. It is a situation where no one exploits and nor being exploited. In addition, governance is a mechanism through different institutions which attempt to tackle these forms of violence with a broader vision to establish an egalitarian peaceful society. These institutions may be formal and sometimes informal. Thus, the relationship between peace and governance is well established in national, regional, and global level. Apart from these, proper personal governance and proper functioning of social institutions are also necessary to minimize violence. At national level, different government and non-governmental entities are working for peace and development. At regional level, regional organizations are working for political and economic integration and promoting peace and development through different institutional mechanism. Moreover, international organizations like United Nations with its all organs working to promote global peace, security, and development. Finally, justice is one of the fundamental principles of governance which should be ensured to achieve peace at all level.

# Pension Fund Regulation and Governance

Usman W. Chohan
UNSW Canberra, Business School, University of New South Wales, Canberra, ACT, Australia

## Synonyms

Accountability in the pension system; Pension fund oversight; Social insurance governance; Social security and accountability

## Definition

"Pension Fund Regulation and Governance" refers to the series of procedures, rules, and mechanisms that help to ensure transparency and accountability in the function and regulation of pension funds, along with a further emphasis on mitigating *principal-agent problems* and providing security and returns to principals.

## Introduction

Pensions funds (PFs) are investment vehicles that serve far-reaching political, social, and economic functions. As economic entities, pension funds are an important instrument for the deployment of significant pools of savings and must therefore work to generate and provide substantial economic returns to their principals. As social entities, PFs provide principals with two important forms of security: one being in the tangible income that they disburse and the other being in the intangible psychological sense of security that they provide to principals, as a known source of future income. As political entities, PFs are vulnerable to the energies of political agents that bestride the tension between the short- and long-term considerations (Wong 2016), where short-term considerations include the temptation to draw on pension resources to fund immediate requirements and long-term consideration include the need to preserve capital for future years.

When executed properly and continually, good governance can have many positive effects for all stakeholders in the pension fund architecture (see Stewart and Yermo 2008). These benefits include a robust and well-entrenched sense of trust among all stakeholders; a reduced need for prescriptive and active regulation; and an easier and better-facilitated array of supervision mechanisms. Beyond this, good PF governance can also influence the level of corporate governance in the companies that PFs choose to invest in. Well-managed PFs are likelier to seek value for their investments through a more active and better-engaged shareholder policy, which can improve the level of fund stability and pension fund returns in the long-run (Wong 2016; Stewart and Yermo 2008; Clark 2004).

Given their far-reaching and multifaceted importance, it has become increasingly evident that PFs must have structures and endowments that facilitate good governance, accountability, and transparency (Clark 2004). Without such mechanisms, pension funds risk falling prey to the perils that jeopardize a great many fiscal institutions, including dissatisfactory performance and returns, poor investment decisions, internal and external conflicts, a loss of reputation and trust, and an inability to plan or prepare for shocks or long-term requirements (see Chohan and Jacobs 2017; Wong 2016).

This chapter proceeds by examining the complexities that arise in studying pension fund governance, the structures of good governance including boards and management, and then considers specific best practices to address commonly noted deficits in pension fund governance.

## Complexities in Governance

The basic objective of the regulation contouring PF governance should be to minimize sets of conflicts of interest that can arise between members (principals) and fund managers (agents), in the course of generating returns and protecting the savings of the principals. These conflicts of interest are also referred to as "principal-agent" problems or "agency" problems (Clark 2004).

However, that basic objective of PFs is complexified by the fact that pension funds are not simple profit-maximizing institutions. Rather, PFs can have a series of objectives, including the protection of capital, the disbursement of cash flows across certain time-constrained functions, or the mandate to invest (or avoid investing) in certain forms or types of assets. The structures of governance and accountability of PFs must reflect this multiplicity of objectives.

A further layer of complexity is appended in realizing that pension funds are structured differently around the world, in terms of regulatory rules and regimes (Stewart and Yermo 2008). Their international heterogeneity has made it difficult for academics and practitioners to resort to generalizations in many instances, and the work of PF governance must be mindful of the unique circumstances of each country. That diversity notwithstanding, there are patterns that can be gleaned from cross-country studies, which begin to provide the rudimentary templates for consideration in PF design (see Stewart and Yermo 2008).

To this point, although the level of standardization between international PFs can increase, there is an inherent limit to how far this exercise can go because of the ultimate differences between (1) demographic and (2) economic requirements that underpin the regulatory framework for PFs in each country. Furthermore, in choosing the appropriate governance structure for PFs, it is important to factor in the financial ecosystem, both public and private, in which PFs will operate. This includes the depth of capital markets, the level of existing public regulatory oversight, and the levels of transparency demanded by other structures of accountability.

The Global Financial Crisis of 2008 was a critical event in galvanizing pension fund stakeholders towards governance reforms, for several reasons. First, it highlighted the interdependence of financial markets and the systemic risks posed to the entire system, which were previously overlooked due to their complexity. Second, there was a realization that inadequate accountability and poor governance, while possible to overlook in the immediate term, ultimately lead to a

catastrophic destruction of value for principals. Third, the crisis helped to reassert the doubts about "laissez-faire" approaches to financial markets, whereby agents were simply assumed to work in the best interest of principles. Fourth, given the long-term oriented nature of PFs, there was also a realization that financial markets are dominated by a pervasive short-termism that is not conducive to the protection of capital over extended horizons of time, which further validates the need for robust governance.

There is also a demographic element that must be considered in PF regulation and governance. Many countries, particularly those within the OECD, face a looming crisis to the sustainability of their pension systems, caused by the accelerating aging of their populations. As a larger cohort of their populations leaves the workforce to join the ranks of retirees, the pension system begins to face ineluctable stresses. While some countries are proactive in addressing the sustainability of their pensions systems, other countries find themselves unable to do so due to the extremely politicized nature of pension systems, wherein more organized groups of aged voters prevent governments from making drastic changes to pension sustainability programs. Pension fund regulation and governance must be mindful of these complexities because they serve as the backdrop for which accountability structures must be designed and effectuated.

## Boards as Mechanisms of Good Governance

Good governance in PF regulation must be founded on the notion that there is a principal-agent relationship that must be led by a sense of fiduciary duty and trust (Clark 2004). The governance of PFs involves the managerial control and regulation of the organization, which is premised on the accountability and oversight of management itself. It must therefore incorporate risk-based measures that are conscious of volatility and uncertainty over future time-periods as well. As a general rule, the more sophisticated the investment strategy of a PF, the stricter its governance and oversight requirements become. Similarly, the more complex the administrative arrangements of the PF's plan, the tighter the operation oversight needs to be.

In this regard, it is important to recognize the central role that **boards** play in effectuating governance (see Ambachtsheer et al. 2006). Every autonomous PF establishes a board as its governing body, which takes responsibility for PF's operation and oversight. As the ultimate decision-maker, the board maintains an overall responsibility for the PF's strategic decisions, including holding a mandate for setting investment policy; choosing investment managers, platforms and other service providers; and reviewing fund performance at regular intervals. In this sense, the board of a PF serves as the equivalent of a board of directors in a corporation, which is ultimately responsible for creating shareholder value and protecting shareholder assets.

Governance research has shown that boards play a key role in ensuring both governance and good investment performance, and the two have found to be linked to such an extent that good governance can account for as much as 1–2% of addition annual pension fund return, if not more (see Ambachtsheer et al. 2006). The converse has also been found to be true, as PF performance declines when governance problems persist, including when there is a poor process for selection for board members, weak oversight, a lack of self-evaluation of board effectiveness, a lack of clarity between board and management on responsibilities, and problems related to compensation of both (see Ambachtsheer et al. 2007).

For PFs, the board may be categorized as the **institutional type,** the **contractual type**, or the **trust type** (see Rajkumar and Dorfman 2010). Their boards may be either internally or externally situated and as either single-tier or two-tier structures. The implementation of a single- or two-tier structured board represents a tradeoff between strengthening oversight and quickening the decision-making processes, and in this sense it represents a tradeoff borne of *public value theory* between "efficiency" and "democracy" (see Chohan and Jacobs 2017). The choice of board

structure is often dictated by legal stipulations and broader PF regulation at the national level.

**The institutional type** turns the PF into an independent entity with a legal personhood and capacity and with an internal governing board. This model is found in OECD countries such as Denmark, Finland, Hungary, Italy, Japan, Norway, Poland, and Switzerland (Stewart and Yermo 2008). In most of these cases, pension funds have a single-tier governing board, and its members are typically chosen by the sponsoring employers and employees. Other countries have two-tier structures, as in Germany and the Netherlands, where a supervisory board is responsible for selecting and monitoring a management board, which in turn is responsible for all strategic decisions.

By contrast, **the contractual type** is premised on treating PFs as segregated pools of assets without legal personhood or capacity, to be managed by a separate entity. These entities are generally banks, insurance companies, or pension fund management companies. The contractual type is more prevalent in OECD countries such as the Czech Republic, Mexico, Portugal, Slovakia, and Turkey (see Stewart and Yermo 2008).

Finally, **the trust** type is prevalent in Anglo-Saxon countries such as Australia, Ireland, and Canada and blends characteristics of the institutional and contractual types. At its core lies the concept of "trustees" who have the legal title to pension fund assets, whose trust assets they must administer in the sole interest of plan participants along a trust deed which identifies those participants as the beneficiaries.

These diverse structures are nonetheless bound by common principles regarding the board's role in governance, including acting in good faith, fiduciary duty, protecting principal interests, choosing agents, overseeing management decisions, outlining strategy, and reviewing fund performance.

Board members serve PFs best when they are experienced, well-respected, and nonpartisan. Nonpartisanship is crucial for dispassionate oversight (Chohan and Jacobs 2017), while experience and good reputations can provide political capital to PFs in instances where controversial or sensitive decisions need to be made (Wong 2016). For example, as mentioned earlier in discussing the impact of the Global Financial Crisis, many pensions funds faced a backlash from stakeholders for the staggering investment losses of the time. However, boards with high stature and recognition of their expertise were better able to maintain operations and market-competitive pay structures for their funds even in the face of such an economic shock (Wong 2016).

However, pension fund regulation is not an ambit solely relegated to well-functioning boards. Rather, they are but one element in the governance architecture, which also includes financial market regulators and pension supervisory authorities, as well as civil society and the general public. PFs must be proactive in their engagement with these accountability institutions, so as to assure market stability and the wider interest of their own principals and stakeholders. Some well-managed PFs take the initiative to proactively keep government overseers up to date so that those institutions will not feel a need to be intrusive in the longer-run (Wong 2016). Similarly, some pension funds launch communication campaigns to inform the general public about significant changes to their investment strategies, such as shifting to higher-risk asset classes with ensuing higher volatility in returns, and this is done to inform them in a pre-emptive way so that the possibility of stakeholders pressuring politicians to intervene in situations of market turbulence is reduced (see Wong 2016).

## Deficits of Governance and Possible Solutions

Faced with continuous challenges, increasing complexity, and a significant regulatory imposition, PFs must navigate a complex space and lean on governance mechanisms such as boards that are mindful of difficulties in conducting sustained and responsible governance. There are numerous deficits of governance specific to PFs which can be addressed through targeted measures, which boards must seriously consider as they adhere to a commitment of good governance (see Table 1).

**Pension Fund Regulation and Governance, Table 1** Deficits of governance in pension funds

| Deficit | Description | Possible solutions | Examples |
|---|---|---|---|
| Imbalanced representation | PFs can have a diversity in their stakeholder base, which may not be reflected in their boards or management. This creates a principal-agent problem insofar as sufficient representation of principals is left unmet | Boards can be proactive in incorporating members who reflect the diversity of their stakeholder base, and appoint managers who reflect that diversity as well. | OECD countries such as the Netherlands, Canada, and Sweden have begun to emphasize that boards should reflect diversity of stakeholders |
| Insufficient input of expertise | The complex nature of pension fund management requires a substantial input of relevant economic, financial, legal, and regulatory expertise, without which pension funds become increasingly exposed to risk of losses | 1. Boards may acquire or appoint members and managers with requisite expertise<br>2. Boards may externalize the use of expertise through capable trustee organizations | The Australian model of *Trustee Partners* externalizes the expertise of trustee-related functions to a capable, specialist organization |
| Conflicts of interest | Various types of interwoven interests can reduce the transparency and accountability of pension funds | Measures such as implementing codes of conduct, ethical codes, and *rules for fiduciarity* help prevent and reduce conflicts | A growing number of pension schemes in OECD countries adhere to such ethical codes |
| Defined contribution (DC) plan | DC plans shift the risk from institutions towards participating individuals, which increases the risks to these individuals in the absence of strong governance mechanisms | 1. Stronger pension authorities can bridge the gap in DC structures<br>2. Stronger management committees can mitigate the institutional-individual risk disparity | The European Union and the OECD are pushing for much stronger pension authorities, and encouraging more proactive management committees at large pension funds |
| Fragmented pension funds markets | Regulation, oversight, and supervision of pension funds is made more difficult when the pension sector is heavily fragmented | Governments may encourage the consolidation of pension funds, and private pension funds can proactively acquire fragmented entities | The Australian pension fund ("superannuation") landscape, with the approval of government, has undergone consolidation that has allowed larger, more efficient players such as Sargon Capital to emerge, therein spurring cost-efficiencies and technical innovations within the Australian pension system |
| Politicization | The highly politicized nature of pensions leaves pension funds vulnerable to interventions that can ultimately destroy stakeholder value | Politics cannot be eliminated from the pension equation in a democratic society, but accountability within the political architecture can dissuade excessive political intrusion | Legislative Budget Offices are a nonpartisan economic office that can produce analysis on pension conditions that may dissuade heavy-handed interventions by politicians |

## Conclusion

The governance of pension funds is crucial given their substantial role as economic, political, and social entities. However, the core process of PF regulation suffers from significant complexity and from challenges such as the aforementioned principal-agent problems. Strong governance mechanisms can create a robust and well-entrenched sense of trust among all stakeholders,

a reduced need for prescriptive and active regulation, and an easier and better-facilitated array of supervision mechanisms. Conversely, weak governance mechanisms can lead to dissatisfactory performance and returns, poor investment decisions, internal and external conflicts, a loss of reputation and trust, and an inability to plan or prepare for shocks or long-term requirements. Boards play a significant role in effectuating accountability in pension funds, and with strong expertise, good reputation-management, and proactive engagement with management and stakeholders, they can act as powerful contributors to good governance. While their design might differ across the institutional, contractual, and trust types, they are bound by similar fiduciary responsibilities and are all expected to enhance the level of accountability in their institutions. The aftermath of the Global Financial Crisis of 2008 and lingering demographic trends reinforce the pressing need for stronger governance and accountability measures. The growing layers of complexity around pension systems will make this all the more true in years to come.

## Synonyms

Defined benefit pensions; Fiscal strain; Fiscal stress; Funding shortfalls; Other post-employment benefits; Retirement crisis; Retirement obligations

## Definition

*Pensions and other post-employment benefits* are compensation promised to an organization's employees with deferred accessibility until after a given period of employment (the "vesting" term) and/or the employee's attainment of a stated age. Such compensation is typically accessible only after an employee's service to an organization has been willfully terminated.

## Introduction

The level to which local governments have met their funding obligations for pensions and other post-employment benefits (OPEB) is generally evaluated by a combination of three factors (GAO 2008: 2):

1. The status of *annual required contributions* made to their pension and OPEB trust funds; the extent to which the local government is meeting an actuarially determined plan for its pension and OPEB obligations.

P

2. The *funded ratio*; the actuarially accrued benefit liabilities of trust funds, compared to the actuarial value of each trust fund.
3. The amount of the *unfunded accrued liability* for each trust fund; representing the extent to which trust fund obligations will meet or exceed a fund's assets.

The fiscal impact that results in unfunded liability is applicable anywhere pensions and OPEBs are a part of employee's wage and salary package. These factors represent the product of a trust fund's returns on investments, long-range fiscal planning, and the political will of its controlling elected officials. Cities of all populations and socioeconomic bases are seeing their retirement costs exceed 50% of their payrolls and are seeking legislative relief to roll back benefits (Ward 2010).

## Pension Effect on Fiscal Stability

Pensions and OPEB are salary costs deferred until after an employee has met the criteria for claiming them and has willfully separated themselves from that employer. Despite being compensation, the payment for these elements of total compensation does not actually occur until later fiscal periods. However, they are an expense in the periods in which they are earned. Despite this, many local governments only fund them on a pay-as-you-go basis. This follows the Governmental Accounting Standards Board (GASB) contention that pension benefits should be recognized on an accrual accounting basis and OPEB costs on a modified accrual basis. GASB's contention is that they are a part of total compensation and, when accrual or modified accrual accounting for their cost is not utilized, they may easily become an unfunded liability. Failure to appropriate them when earned means total unfunded liabilities grow and have substantial effect on future revenue streams despite being expenditures from previous periods.

Changes in accounting standards are effected by GASB through the issuance of "statements." In June of 2012, GASB standardized how pension and OPEB costs are accounted for and reported through GASB Statement 67, *Financial Reporting for Pension Plans*; GASB Statement 68, *Accounting and Financial Reporting for Pensions* by governments that provide employee pensions; and, later, GASB Statement 71, *Pension Transition for Contributions Made Subsequent to the Measurement Date – an amendment of GASB Statement No. 68* (GASB 2013). These GASB statements strengthen GASB Statement 43, *Financial Reporting for Postemployment Benefit Plans Other than Pension Plans*, as well as GASB Statement 45, *Accounting and Financial Reporting by Employers for Postemployment Benefits Other Than Pensions*, issued in June of 2005 (GASB 2006). Standardization mandates uniform reporting as well as recognizing and presenting the liabilities that are created by these features of employee compensation.

### Unrealistic Expectations for Pension Trust Earnings

Actual earnings by pension fund assets are critical to both the funded ratio and the calculation of the fund's annual required contribution (ARC) (GAO 2008: 9–10). Overestimating returns on investment (ROI) for fund assets decreases the level of a local government's ARC. Overestimating requires the ARC be increased in future years. Conversely, underestimation can decrease future ARC appropriations. The value of investments can also vary daily due to swings in the investment market that reflect the overall economy (GASB 2012). Thus, the date at which annual fund earnings (and therefore liabilities) are measured can be important. The failure to make an ARC on schedule also affects the funded ratio: Interest earned is reduced because it is earned on a smaller principal.

The sufficiency of a trust fund's ability to meet its long-term obligations is a calculated ratio of the projected value of a fund's assets compared to its projected obligations. One of the issues of financial reporting that GASB 67 and GASB 68 are intended to alleviate is the use of unwarranted estimates for return on trust fund investments for projection and the ratio calculated to express the level of coverage. An actuarially substantiated coverage ratio of 80%, or more, is commonly considered the benchmark for evaluating adequacy of fund coverage (Simms and Co. 2010; GAO 2008).

The use of unrealistic assumptions in estimating planned earnings has sometimes been intentionally used by fund managers. Such estimations enable a fund manager to calculate a lower ARC. CNBC, in a 2013 report, noted that the average projected return of defined benefit fund investments by the 100 largest public pension funds was 7.84%, while the actual ROI of those funds over the previous 10 years averaged only 5.6% (CNBC 2013). Another technique that incorporates overestimation is "smoothing." An averaging of gains and losses over longer periods of time allows the effect of a growing stock market to be carried into future years, where the gains may be lower. These make funding problems appear smaller but limit the recapture of asset growth during recoveries. The negative effects of overestimating ROI only become evident in the long term, when the projected revenue is not available to pay pensions (CNBC 2013). The gains of the .com market in the 1990s encouraged local governments to offer greater pension and OPEB benefits, based on trust fund projections. When it came time for them to start the payouts, the gains had not materialized (CNBC 2013). Non-uniform assumptions, methodologies, and other indicators of financial performance made comparison of pension and OPEB funds impossible. This problem has been noted for some time (ACIR 1985: 50).

The overestimation of ROI is a tactic that GASB 67 and GASB 68 have made much harder to employ. Those statements allow local governments to utilize whatever discount rate (i.e., the ROI) they wish. However, this is only as "long as the projected plan net position .... exceeds the projected benefit payments" (GASB 2016; GASB n.d.). When the plan's net position is no longer equal to or greater than the projected benefit payments (a *crossover point*), a local government is required to utilize "a high-quality municipal bond interest rate" as the discount rate (GASB n.d.).

## Failure to Implement Plans that Accommodate Future Benefits

Failure to fully appropriate current obligations means that the required funds may not be available or leverage themselves to their planned level of growth. That is, the interest that is earned and compounded is on a lesser balance than planned. This increases the amounts that must be appropriated (the ARC) to meet pension and OPEB obligations.

Local governments have been aware that the costs of pension benefits have been rising for some time. The National League of Cities (NLC), in their report on cities' FY 2000 fiscal conditions, advised that the increasing cost of pension benefits was negatively affecting cities' budgets. Responses to the NLC survey indicated that 47% stated "changes in costs associated with employee pensions .... had a negative impact" on "the abilities of cities' to meet their overall needs in FY 2001" (Pagano 2001: 11–13). The intervening 10 years between the 2001 NLC report and the seven municipal bankruptcies occurring in the United States since 2011 (listed in Table 1) indicate that the intervening time has not been adequately used by local governments to resolve their developing financial difficulties.

Interestingly, there is no requirement that the ARC actually be made. Similarly, the GASB statements established pension reporting requirements neither required local governments make any specific annual funding or meet some minimum coverage ratio on a periodic basis (Chieppo 2013). A government's Comprehensive Annual Financial Report (CAFR) only must provide information on funding status (the actuarially determined fund net position) and the progress of both defined benefit and defined contribution pension funds in the CAFR's accrual-based statements and as required supplementary information.

**Pensions and Local Government Fiscal Instability, Table 1** Municipal bankruptcies since 2011

Because they deal with funding liabilities, pensions can have an impact upon the local government's cost of borrowing because they, at least partially, represent the risk level of the borrower (GASB 2016, 2013).

### Political Dynamics and Costs

In the recent past, the effect of fiscal instability on local governments has been evidenced in the bankruptcies of cities of varying populations, economic bases, and geographic location. This is exemplified in the differences between Detroit, Michigan (bankruptcy, 2013; population, 713,777), and Central Falls, Rhode Island (bankruptcy, 2011; population, 19,416). The effect of economic conditions cannot be overlooked. However, local government political dynamics are a large part of the pension and OPEB benefits promised.

Political dynamics serve to "complicate any assessment of the direct effects of fiscal stress on the policy responses of localities" (Stein et al. 1986). Complicating elements in the evaluation are that the response to fiscal instability through policy change may not occur immediately and that the responses may pass through a series of "stages" before selective corrective action is accomplished (Levine et al. 1981; Levine 1980).

The earliest reflection of political dynamics on local government fiscal policy occurred in New York City. The "Tweed Ring" maintained political control through the establishment of a coalition of groups who were dependent upon public development projects and patronage appointments. Control of the city's fiscal resources allowed the Tweed Ring to coerce upper classes by increasing and expanding capital development to benefit their economic interests while also providing jobs to the lower classes. This process provided the opportunity to both gain the acquiescence of the upper classes while receiving kickbacks on the project contracts that were being awarded (Shefter 1992: 17–19). The Tweed Ring's patronage was extremely effective in controlling the outcome of elections. During that period, it is estimated that one of the eight voters in New York City was a public employee (Keller 1977: 239).

In a more current example, New York's mayor David Dinkins obtained the support of the city's three largest municipal unions. Following his being voted into office in 1990, Dinkins used the power of his office to declare a 5.5% increase in pay for all municipal employees (Shefter 1992: xiii). While the immediate effect of inflating the city's budget is obvious, to appreciate its long-term effects, one must consider how the city's already liberal pension benefits were affected by the wage increase.

While the salary components of every city department's budget were immediately increased, the increase to postretirement benefits was reflected in pension benefits that rose by the amount of 5.5%, compounded to reflect annual merit and/or COLA (cost-of-living adjustment) wage increases. Pension benefits are most often based upon the highest years of an employee's compensation. At the time of an employee's retirement, their monthly benefit would have been increased by the compounded value, rather than the 5.5% alone. Conversion to estimate the impact and the effect of COLAs, exclusive of any general wage increases, after 30 years of service indicates that every dollar of benefit increase produced by Dinkins' 5.5% general wage increase had the effect of more than doubling its value in the final pension benefit. Applying the Consumer Price Indexes for each year from 1990 through 2020 produces a conversion factor of approximately 2.07 (OSU 2016).

Where postretirement pension benefits are also subject to an annual COLA, the effect of compounding on the initial 5.5% continues to increase. In the case of police and other work classifications entitled to immediate full benefit collections after some specified term of service, regardless of age or disability status, the ultimate impact of the pay increase would be substantially more than initially planned and would likely stress the city's pension trust coverage ratio even further. When perceived from this perspective, New York's annually required pension contributions (ARC) were increased by a magnitude far in excess of the immediate cost of the pay increase.

The impact of political dynamics on pensions and OPEB costs is similar. As long as elected

officials can resolve employment issues by agreeing to postretirement benefit improvements that will not affect budgets until after the officials have left their office, the costs for choosing that path are legislatively acceptable (ACIR 1973: 6). The process of "kicking the can down the road" (Stampfler 2013: 235) should not be allowed to continue as the norm.

## Avoiding and Correcting Pension and OPEB Liabilities

### Financial Planning

Long-range financial planning is essential to establishing and maintaining fiscal stability. Knowing whether an organization is facing fiscal instability is possible only when a representative set of an organization's financial indicators have been established. Written financial policy statements concerning the funding of pension and OPEB liabilities are also necessary to maintenance of the trust funds (Matzer 1986: 67–68).

Although the GASB statements address the recognition of the liabilities created, they have not resolved the necessity of establishing and funding trust funds established for those purposes (GASB 2006, 2013). Although the GASB statements require determination of the long-term obligations for pensions and OPEB, nothing obligates the long-term funding of liabilities incurred annually. For this reason, written financial policy statements requiring this practice are advised.

Matzer (1986: 66) specifically identifies unfunded pension liability and annual leave (as well as sick leave liabilities) as being central indicators to the task of measuring an organization's level of exposure to fiscal instability. Matzer supports his position using a National League of Cities survey which indicates that 83% of the respondent cities consider increasing pension costs an important cause of their fiscal difficulties (Matzer 1986: 62). This financial trend monitoring system should also include OPEB liabilities.

A final requirement for this indicator system would be uniformity in the measurement system. To assure year-to-year comparability as well as comparability with other local government's data, an actuarial cost method, such as the entry age normal or projected unit credit costing method, needs to be selected to allow representative comparison with other similar local governments. These methods amortize gains and losses by the fund rather than spreading them (Jarret and Zimmerman 1997: 2).

### "Emergency Financial Managers"

Financial stresses that have built for years must be overcome by municipalities. Some of these sources of financial strain have come from increasing pension and medical and retiree health-care costs. Approximately one-third of the 61 largest cities in the United States are struggling to avoid bankruptcy (Sayegh 2014). Creative accounting maneuvers, one-time spending cuts, and short-term revenue increases will no longer bail municipalities out of their fiscal dilemma (Hakim 2012). More than half the states have enacted legislation that allows them some financial control over local governments that are experiencing financial instability.

There are conflicting opinions as to whether the appointment of an emergency financial manager improves or reduces the ability of local governments to avoid bankruptcy. Some hold that such appointments reduce the control of a local government and increase the probability that the economic situation will worsen (Stampfler 2013: 236). They reduce or excise entirely the decision-making authority of local elected officials (Holeywell 2012). However, the adoption of statute defining the conditions of financial emergency under which a state may appoint an emergency financial manager has long been recommended by the ACIR (1973: 7). Michigan enacted such a law in 2011, in awareness of the growing condition of fiscal instability that was dragging the City of Detroit to the brink of insolvency (Holeywell 2012). This strategy was successful in 1996 when the governor of the State of Florida appointed an interim city manager to take over control of the City of Miami, FL (Dluhy and Frank 2002). In the case of Miami, bankruptcy was avoided by the manager's control of overspending by the city's elected commission.

### Benefit Reductions

When pension and/or OPEB benefits grow large enough to cause fiscal instability, their costs can be mitigated through the use of a number of tools. These all involve a suspension of employer-provided benefits or portions of benefits. These strategies are sometimes referred to as a "claw-back" (Goforth 2014: 4).

One method, if legally accommodated, is suspension or reduction of the cost-of-living adjustments promised. This strategy was employed by the City of Detroit to restructure its obligations in chapter "Organizational Structure and Crisis Management" bankruptcy proceedings. This reduces immediate costs and reduces future pension costs by reducing or eliminating the base of the compounding amount for benefit increases.

A second strategy requires employees to be responsible for a greater proportion of their pension costs. This requires that an employee's required contributions be increased. This lowers an employer's funding liability while increasing the employee's contribution to the pension fund's interest-earning assets.

A third method is a shift from defined benefit to defined contribution plans. Defined benefit plans promise retirees a stated level of benefits paid. Defined benefit makes employers responsible for achieving a stated ROI or higher. Failure increases the employer's liability to the fund; either increasing their unfunded liability or requiring an increased employer ARC. Conversely, defined contribution plans stipulate the annual level of the employer's contribution to the fund on behalf of a covered employee. In this manner there is no specific postretirement benefit guaranteed, and the employee bears the risk of the fund's ROI performance. This can be accomplished by covering all new employees through a defined contribution plan, by offering employees an option to shift from a defined benefit plan to a defined contribution plan, or by saddling new plan entrants with the added cost of the liabilities of the defined benefit plan.

### Pension Obligation Bonds

When a local government finds that it's carrying a substantial unfunded pension and/or OPEB liability, most often the local government will not have the reserves or fund balance to address the obligation. Accomplishing this short-term liability reduction may be possible through the issuance of pension obligation bonds (POBs). The issuance of POBs exchanges long-term debt for alleviation of their unfunded liability. In its essence, this is deficit funding to reduce fiscal stress.

The revenues pledged to retire POBs can come from a combination of three sources: employer contributions, employee contributions, and earnings on the trust fund investments (Kilgour 2014: 123). Employee contributions are typically a set percentage of an individual's salary. They are not expected to change, regardless of changes in unfunded liability. The employer's contribution varies yearly and is comprised of the stipulated ARC plus some calculated portion of the unfunded liability and plan administrative expense (Kilgour 2014: 124). The decision to issue POBs to relieve an unfunded pension or OPEB liability may be motivated by the belief that investments by plan trustees of the bond proceeds will produce an ROI greater than the interest component of the total debt service to be paid. If the financial performance of the borrowed funds does not exceed the interest charges of the issue, the decision to issue POBs is unwise.

Returns to the holders of POBs are taxable, and the issue is most often secured as a general obligation debt of the issuing government. There are numerous risks involved in the issuance of POBs. They include the financial risk of issuing bonds, the risk that investment of the proceeds may not produce gains that exceed interest charges and other costs of issuance. Thus, issuance of POBs is subject to a need to time the investment of the proceeds to when equity costs are low and the potential for growth in their value is great.

A point made above that bears repeating is that POBs turn what was considered to be "soft debt" into "hard debt." That is, the POBs become a liability that is reflected on the local government's balance sheet. Prior to the GASB statements, there was no real presentation of pension and OPEB unfunded liabilities in a local government's Comprehensive Annual Financial Report (CAFR). The GASB statements do change this, somewhat.

However, as noted previously, they impose no obligation to maintain a funded ratio of 100%. Formal debt, however, imposes an obligation to either pay the required debt service or be held in default. This limits a local government's ability to adapt its revenues to its priorities. The subsequent loss of funding flexibility can cause problems (Kilgour 2014: 126).

Other forms of risk include political risk and the need to acquire voter approval for the issuance. The bond proceeds will be used to alleviate an unfunded liability. The lowered liability may be perceived by organized labor as an opportunity to demand increased benefits (Kilgour 2014: 126).

### Bankruptcy

Mobile AL, in 1839, reported the first default of a US city (Hempel 1971: 23). Throughout history, municipal bankruptcies and defaults have occurred in groups (ACIR 1985: 2). The post-US Civil War era saw a rash of defaults, as did 1933–1935, the years of the Great Depression (ACIR 1985: 2–3).

Presently, a local government in default can file for debt restructuring under chapter "Organizational Structure and Crisis Management" (U.S.C. 901). Chapter "Organizational Structure and Crisis Management" provides a number of advantages over the chapter "Organizational Environment" filing that is required of private corporations. Among them is the ability to unilaterally reject the terms of collective bargaining agreements where it is necessary to achieve a successful plan for restructuring. To override obligations under a collective bargaining agreement, chapter "Organizational Environment" requires the debtor to propose to the bargaining unit, prior to a court hearing held to approve or reject the debtor's plan for adjustment of debt, a modification of the agreement. The agent of the bargaining unit must then refuse the proposal. Additionally, the terms that have been rejected must be shown to be necessary for the successful enablement of the debt adjustment plan (Spiotto et al. 2012: 65). Under the provisions of chapter "Organizational Structure and Crisis Management" no rejection of terms by the bargaining unit is necessary.

Thus, chapter "Organizational Structure and Crisis Management" allows for the reduction of pension and OPEB benefits. The emergency financial manager for the City of Detroit utilized the terms of chapter "Organizational Structure and Crisis Management" to achieve reduction of post-employment benefits, an element critical to the plan of reorganization. Although the language and case history of chapter "Organizational Structure and Crisis Management" allows for a complete rejection of all benefits, the emotional and economic stress of such an action makes that course of action unlikely. In the case of Detroit, what is referred to as "The Grand Bargain" created a coalition that included concessions by labor groups and pledged donations by corporations. This made complete rejection of the bargaining agreement retirement benefits unnecessary.

## Theoretical Causes of Fiscal Instability

After review of the examples and explanations described earlier, it becomes evident that there are recurring themes. This is both supported and reinforced by the academic research that has been accomplished on fiscal strain. Extending back to the 1970s, research has categorized the causes of fiscal instability into four broad types. These are briefly described below:

1. **Socioeconomic Decline**: Economic and demographic factors deplete the tax base; increasing the demand for public services. Outmigration occurs, leaving a population that requires more services, further increasing the cost of government. The decreased demand for real estate, due to outmigration, reduces taxable values and shrinks tax revenue (Kimhi 2008; Pammer 1990; Rubin 1982).
2. **Local Political Dynamics**: Fiscal instability results from changes in voter coalitions that cause elected officials to curry their favor their through spending. Political pressures by local influence groups motivate fiscal policy and decision-making. Fiscal instability may also result from politicians seeking the favor of employee unions, overextending

government's commitment to salaries and benefits (Kimhi 2008; Pammer 1990; Rubin 1982).

3. **Bureaucratic Expansion**: Bureaucrats, acting in their own self-interest, increase both the size of government and the salaries and benefits paid to employees. This increases their influence and power while also increasing presiding bureaucrats' salaries and benefits (Kimhi 2008; Pammer 1990; Stein et al. 1986: 111–144). The increased salaries and benefits increase the cost of future pension and OPEB trust fund requirements.
4. **Internal-Management Perspective**: Inept management either indirectly causes fiscal instability through managerial and/or fiscal misfeasance or directly causes it by acceding to risky fiscal plans and decisions made to alleviate political vulnerability (Timiraos 2012; Kimhi 2008; Pammer 1990; Rubin 1982). Failure to create a long-term financial plan that fully funds promised benefits often results from internal-management issues.

Little imagination is needed to perceive how pension and OPEB obligations can produce the fiscal instability that can result from each of these four causes.

## Conclusion

The preceding presents only a broad overview of the relationship of pensions with the causes of fiscal instability, the tools used to alleviate that condition, and the effects of their usage. Despite the potency of its effectiveness in reducing crushing debt and costs of labor that are difficult to deal with using other methods, the results of bankruptcy are hard for a local government to deal with from either the social or organizational perspectives. A government's citizens will suffer from a reduction of services that may be critical to their life's requirements. Socially, retirees and current employees will not likely extend their appreciation for having their benefits reduced. Further, with the reduction of gross wages and retiree annuities that are spent in it, the local economy is likely to feel the effects of decreased demand for the goods and services it provides.

Thus, it is quite easily seen that the best way to survive bankruptcy is to avoid it entirely. This can be best accomplished by engaging long-range fiscal planning that accommodates future costs of pension and OPEB trust funds while monitoring and acting upon the status of the net position of their funding. This should include estimation of plan earnings using realistic expectations and staying current in the appropriation of the funds' annual required contributions. Lastly, written policies applying to the maintenance and management of the pension and OPEB trust funds should be adopted and implemented.

# Perception of Performance Management Practice: A Sectoral Comparison

Hyung-Woo Lee
Department of Public Administration, Hannam University, Daejeon, South Korea

## Synonyms

Internal competition: Competition among employees, Competition at the individual level, Competition in the workplace; Performance-based HRM: Performance-based reward system, Performance-based paradigm, Performance-based pay

## Definition

Performance-based Human Resource Management: the internal HR policy or systems that mandate the use of individual performance evaluation in making important personnel decisions regarding pay increase, promotion, and awards.

Internal competition: competition among individual employees within an organization, not among organizations.

## Introduction

The emergence of New Public Management (NPM) has altered how government is operated. One of the notable changes is how public organizations manage their human resources, especially how they reward employees. Traditionally, governments have rewarded their employees based mostly on tenure, assuming that tenure reflects the ability necessary for conducting tasks. This assumption is somewhat rooted in the notion of career civil service. That is, government personnel are best equipped with the professional skills and knowledge specialized for the government context. Hence, the HRM practice for career civil service aims to hire employees mostly at the entry level and train them on the job as they move forward along the internal promotion ladder. However, the NPM challenged this notion and increased the number of co-optation (Kim 2002). Since 1999, the South Korean government have recruited experienced workers from the private sector for upper middle management positions. Currently, about 10% of the public managers in municipal governments are co-opted from outside of the government (Park et al. 2002). Also, it dramatically changed how their employees are held accountable and rewarded. Governments implanted the performance-based reward system which has been typically the HRM practice of the private sector.

Since the practice of performance-based HRM is somewhat foreign to the traditional management principles of government, scholars and practitioners alike opposed the implantation of it, and this controversy is still ongoing. One of the main arguments of the skepticism is that performance-based HRM will increase competition among employees which may serve to undermine certain aspects of performance (Bloom 1999). Admittedly, there has been a competition under the traditional HRM system as well. However, under the traditional system, public employees would usually compete for promotion. The extent of internal competition was limited since promotion is not only tenure-based but also occurs intermittently. Given that an employee is considered for promotion only after she serves the organization for a considerable period of time, the frequency and magnitude of working in a competitive environment were far lesser than under the new system of performance management.

In fact, however, infusing competition is one of the prescriptions of NPM. The proponents of NPM believed that competition promotes the revitalization of public organization. Osborne and

Gaebler (1992), one of the pioneers of the movement, viewed that the inefficiency of government organization is attributed to the absence of competition. Although they did not explicitly endorse competition at the individual level, they certainly proposed the extensive reform toward performance-based HRM, such as performance-pay. Also, they proposed to benchmark private sector practices. Competition is indeed a key element of the performance-based HRM that has enabled private sector organization to accomplish greater productivity than public ones. Many private firms have had performance appraisal system limiting the proportion of employees to be rated as top tier performers (Cohan 2012), which is intended to increase competition among employees, and eventually to make the entire workforce motivated.

This chapter discusses how the South Korean employees perceive the government reform toward performance-based HRM with a particular focus on internal competition among its employees. This study compares these perceptions, including the levels of felt competition, in public sector organization to that of the private sector. This comparison will provide an insight on how sectoral difference plays out in adopting the performance-based HRM system in the public sector, and whether the public sector reform has accomplished the intended goal of creating competitive work environment.

## The Reform of Performance Management in the South Korean Government

Since the economic crisis in 1997, the South Korean government have extensively reformed their governments at all levels (Kim 2000) embracing the ethos of NPM. Given this context of South Korean reform, it was a fight for survival in an emergency, rather than a strategic choice for improving efficiency. As such, the scope and magnitude of the reform were far greater than other developing countries in which the principles of NPM are adopted to modernize their government system.

Performance-based HRM can be practiced in many ways. Although using the information as to individuals' performance for personnel decisions constitutes the central element of performance management, the effectiveness of the HRM practice as a motivating tool depends on the following two institutional elements. The first is securing a considerable difference in reward between high and low performing employees. In many of today's private firms, the salary scale is designed to create significant differentials between employees with different task performances, which serves to promote competition among them (Samnani and Singh 2014). Many of these companies also have an internal policy mandating to eliminate a certain proportion of low performing employees annually. Under this policy, employees are alert to the risk of layoff, which allegedly makes the entire workforce remain motivated. The second involves the use of relative evaluation scheme. In most private firms, employees' performance is assessed in consideration of their colleagues'. Also, the number of employees who can receive certain performance grades is limited. Under this scale, even if all the employees perform reasonably well, someone has to be forced into the poor grade band. The effect, of course, is that employees try to work harder than their competitors.

According to the ethos of NPM, the South Korean government have made considerable efforts to benchmark this HR practice typical of the private sector. First of all, in 2001, president Dae Joong Kim established the performance bonus compensation system. Performance appraisal is conducted twice a year based on which performance bonus is granted at the end of the year. In this system, a certain proportion of government employee salary is determined by performance grade. Second, they placed limitations on how many employees can receive each grade level. Table 1 presents the percentage of employees that can be designated to each grade band and the amount of performance pay. The rate of employees and pay amount per each grade has gradually increased in the way that increases competition among employees. For example, the pay differentials for public school teachers started

from 10% in 2001 and continuously increased up to 70% until the incumbent president Moon took office and decreased it to 50% in 2017.

## The Career Choice of Public Officials in South Korea: Competitive Personality

Individuals' personality significantly influences their job choices. People want to choose the workplace in which they can enjoy working and, they believe, perform well. Scholars of public administration have found that those who are motivated by achieving public value tend to choose the career in the public sector (Perry and Wise 1990). Another significant, yet unexamined, individual difference affecting career choice is the preference for competition. Scholars have found that people have a different propensity for competing with others (Collier et al. 2010). Some enjoy the tasks that entail excelling others in a competitive task, while others feel the greater psychological strain in a competitive environment.

**Perception of Performance Management Practice: A Sectoral Comparison, Table 1** Performance pay scale in South Korean government employees (2018)

| Grade level | S | A | B | C |
|---|---|---|---|---|
| Population (%) | 20 | 40 | 30 | 10 |
| Pay amount(%) | Over 172.5 | 125 | 85 | 0 |

Pay amount is indicated as the percentage to individual's monthly salary

Public sector employees are likely to possess the propensity of avoiding competition rather than pursuing it. Scholars have found that public employees generally prefer job security (Lee and Choi 2016). Given that job security refers to the absence of the risk related to losing the status of employment, this reflects the risk-aversive propensity of public employees. Likewise, the tendency to avoid the risk of losing their status in their workplace is commensurate with the tendency to avoid competition in the workplace. Thus, the propensity for competition will also be less for public employees than for private sector counterparts.

Surveying 308 public employees from central and local governments and 300 private sector workers from diverse industries in South Korea reveals that this is the case. Figure 1 presents the mean values of the competitive personality of the two different groups of employees. Measuring it with the scale developed by Keresztes et al. (2015) using a six-point Likert scale, the mean value of competitive personality for the private sector employees was 3.46, while it was 3.06 for public employees. The independent sample t-test score reveals that this difference is statistically significant ($t = 5.67$, $p = 0.00$).

Admittedly, it is impossible to preclude the possibility that this difference in competitive personality can be attributed to organizational socialization, rather than pre-entry personality difference. This possibility may be plausible given that, as Bozeman and Kingsley (1998)

**Perception of Performance Management Practice: A Sectoral Comparison, Fig. 1** Comparison of competitive personality

found, risk orientation is dependent on organization-specific characteristics, rather than the sector itself. However, considering the particular context of the South Korean labor market, this difference is more likely to indicate the risk-aversive propensity of public sector employees. Some major multinational companies such as Hyundai and Samsung take up the greatest portion of the South Korean national economy. According to recently published statistics, the ten biggest companies produce 44% of the Gross Domestic Product of South Korea. Also, the salary differential of the workers between these international conglomerates and ordinary mid-size companies in South Korea is much greater than in any other countries. According to Noh (2018), the average monthly salary for the workers in Korean large scale companies (with over 500 employees) 6097 USD, while that of the comparable US large scale firms was 4,736 USD. Calculating these figures as a proportion to the national GDP, Korean large company workers are receiving 1.91 times more than the US counterparts. Workers in Korean medium-sized companies earn only 57% of the salary of the large-scale firm workers, while in the USA, the workers in the medium-sized firms earn 79%. Therefore, working for these major firms is a great aspiration of Korean college students.

In spite of this, becoming a public servant in South Korea has constantly increased over the last several decades after the economic crisis in the 1990s. Accordingly, passing the national exam for hiring public servant has become increasingly competitive. In 2017, the South Korean government hired 4,910 public employees among 228,368 applicants (Source: The Ministry of Personnel Management (http://www.mpm.go.kr/mpm/)). The reason why Korean students prefer jobs in the public sector is clear. Compared to the employees in those top companies whose average retirement age is around 40 (According to Sung and Ahn (2006), the point of centraflexure in employment rate curve in South Korea appears around 40–44 in age, indicating that the national employment rate is at its peak at the age of 40–44 and decreases afterwards.), the employment of Korean public employees is guaranteed until 60 under the law. In this sense, once hired, public employees are insulated from competition in the workplace and the resultant loss of employment. Therefore, given that public officials in South Korea had aspired to get a job in the public sector in spite of the competitiveness and of the considerable pay discrepancy, the finding is likely to reflect that public employees in South Korea have much less preference for risk-taking and competition even before socialized after entry.

The difference in the preference for competition resulted in greater collective resistance of South Korean public employees to adopting the performance-based HRM. As the South Korean government gradually changed the HRM regulations to increase the magnitude of competition in public organizations, the Korean Government Employee Union have protested against the policy change. The Korean Teachers and Educational Workers' Union also joined the collective action. As a strategic resistance to the performance-based HRM, individual public employees comply with the policy on the surface but are attempting to sabotage on it. One of the typical examples of the sabotage includes distributing the best performance grades on a rotation basis (Han 2010). As a result, the intended goal of the reform toward performance-based HRM has rarely been achieved.

## The Practice of Performance Management

Despite the considerable efforts made by the South Korean government, the performance-based reward system in public organizations is significantly constrained. This is because the measures that public organizations can take to increase competition are inherently limited due to the nature of financial allocation. Public organizations hardly secure enough financial resources to provide considerable extra compensation for high performers. Private firms with employees of higher productivity will result in greater financial return for the organization. In such a case, it causes no controversy to distribute the additional revenue to their employees depending on their

contributions. To the contrary, the government budget is usually not linked to their performance. And it is politically infeasible for the government to persuade the citizens of increasing the labor expenditure even if the quality of public service increases (Perry et al. 2009). South Korean government coped with this constraint by designating a larger portion of employee paycheck as performance-contingent, and at the same time, decreasing the amount of base pay.

Since the decrease in the amount of base pay will inevitably cause complaints, dissatisfaction, and declining morale among employees, the proportion of performance pay cannot be significant enough to attract employees in public organization. The survey result shows this. As indicated in Fig. 2, the perception that the proportion of performance pay is significant was 3.56 for private sector employee, while it was 2.79. The difference was statistically significant ($t = 9.69$, $p = 0.00$). To the contrary, public employees tend to perceive that their performance is appraised using the relative scheme as much as private sector employees. The mean value of relative evaluation perception for public employees was 4.01, while it was 4.18 for private firm employees. The difference was significantly less than the difference related to the perception of the performance-pay amount and was not statistically significant applying a stringent standard of the alpha level ($t = 2.33$, $p = 0.02$). In fact, we do not know how stringent relative scale private firms use. Each company may use a distinctive scale. However, it seems that on average they use the evaluation scale the degree of which is generally comparable to that of South Korean government presented in Table 1.

Scholars have noted that performance indicators in public organization are less accurate due to the greater goal ambiguity. However, the survey did not confirm such a notion. The perception of appraisal accuracy for public employees (3.07) showed no significant difference from that of private sector employees (3.09). The difference was negligible and statistically non-significant ($t = 0.27$, $p = 0.79$). Goal ambiguity does not appear to be a significant factor in the perception of appraisal accuracy. Although the goals of private firms are simple and clear, the individual contribution to the achievement of organizational goals is ultimately evaluated based on supervisors' subjective assessment. Hence, the issue of performance appraisal accuracy appears to depend on other factors than the sector, such as the quality of rater training, the participative nature of goal setting, etc.

## Employees' Feeling of Competitiveness

The differences in the practice of performance-based HRM, along with a different propensity

**Perception of Performance Management Practice: A Sectoral Comparison, Fig. 2** Comparison of perception of performance management practices

**Perception of Performance Management Practice: A Sectoral Comparison, Fig. 3** Comparison of felt competiveness

for competition between private and public employees, engender a different level of felt competition among employees (Fig. 3). The survey reveals that the felt competition of private sector employees was 3.89, while that of public employees was 3.08. The difference was statistically significant ($t = 10.43$, $p = 0.00$).

The results appear to indicate that to infuse competition by implementing performance-based HRM, both of the two conditions should be met: evaluating employees with a relative scale and making a meaningful difference in rewards. Although the South Korean government have made an extensive reform effort to make their employees stimulated by infusing competition, such effort does not appear to have come to sufficient fruition. One of the main reasons for that may be because due to the political nature of budget allocation and the resistance from the public, public organizations were not able to create a meaningful difference in reward, thereby did not offer an attractive incentive. Another reason may be because due to the strong job security protected by the law, it was not possible to provide a significant penalty for low performers. Unlike private sector organizations where termination of employment is relatively easier, public organizations are also constrained in terms of the measures to be taken to deal with low performers. Thus, simply implanting the private sector practice without reforming the entire system did not yield satisfactory consequences.

## Conclusion

The propensity of employees, as well as work environment in government organization, is distinguished from those in the private sector organizations in many ways. In this vein, several specific points can be made. First, public sector employees have a lower degree of competitive personality than private sector counterparts. Although this may be due to the organizational socialization after entry, this is likely to reflect in large part the initial differences of attitudes toward job-related risk between prospective private and public sector employees. Their personality must have affected their career preference of whether they work for a private firm or public organization. Such difference has resulted in a considerable difference in the acceptance of the HRM reform toward performance-based paradigm.

Second, although South Korean governments have made considerable efforts to benchmark private sector HRM practices, the degree of incorporating the principle of meritocracy and improvement by competition into the internal policy arrangement has not up to the private sector standards. The degree to which employees are evaluated with the relative scale is relatively similar

in both sectors of employees. However, the degree of the differential in reward and sanction was far greater in private sector organization than public ones. Considering that South Korean government have made greater efforts to reform their HRM system extensively than other countries, this should be due to the fundamental sectoral differences discussed previously, such as the political infeasibility of increasing the financial allocation for labor in the public sector (Perry et al. 2009).

Third, accordingly, the South Korean government does not appear to have achieved vitalizing public employees by infusing competition among its employees. The survey result reveals that, despite the extensive reform efforts of the government, South Korean public employees are experiencing a smaller degree of competition in the workplace compared to private sector employees.

All these points to the argument that the extent to which performance management can infuse competition among employees is significantly limited in the public sector. Is this indicating the absurdity of performance-based HRM in the public sector? The answer is not straightforward. At least, it is premature to make any firm conclusion. For instance, it may depend on the purpose of performance-based HRM. If the government aims to encourage high performers with the adoption of performance-based HRM, the practice may have failed to do so. However, If the main purpose of the reform was to stimulate those who have been inert due to the absence of sanction, it can be reasonably said that the reform may have had some level of achievement: it may have increased the motivation of low-performing individuals when compared to the past when there was no such reform effort. One of the implications of the Korean case may be that managers intending to reform their HRM systems should have a realistic expectation and understand a limitation.

## Appendix. Survey Items

| Construct | Survey items |
|---|---|
| Competitive personality | I am a competitive individual |
| | I like competition |
| | I often try to outperform others |
| | I get satisfaction from competing with others |
| | I enjoy competing against an opponent |
| Relative evaluation | Employees are graded on a curve in this company |
| | To get a good performance grade in my company, it is more important to outperform colleagues than to produce satisfactory results |
| | Even if all employees perform well, someone will inevitably receive a low performance rating |
| | If many employees perform better than me, I will not receive an excellent performance evaluation/grade even if I performed considerably well |
| The proportion of performance pay | There is a considerable difference in pay between high and low performers |
| | Performance-based pay constitutes a large portion of my salary/paycheck |
| | The proportion of performance pay in my organization is higher than in other equivalent organizations |
| Appraisal accuracy | My performance appraisal is a fair reflection of my performance |
| | My performance is evaluated using accurate and objective indicators |
| | The nature of my job makes it difficult to evaluate my performance objectively |
| | My performance rating depends largely on the subjective judgment of raters |
| | It is likely that my performance will be assessed quite differently if multiple raters rate it individually |

(continued)

| Construct | Survey items |
|---|---|
| Felt competitiveness | I have a fear of falling behind my colleagues |
| | I often feel pressured to outperform my colleagues |
| | I sometimes feel emotionally exhausted because of the high level of rivalry among employees |
| | I am very concerned about not being promoted as fast/quickly as my colleagues |
| | I am afraid of getting a lower performance payment than my colleagues |
| | I feel that my coworkers are more like competitors rather than colleagues and collaborators |
| | I think I have to overcome my colleagues to get ahead in the organization |
| | I believe that my colleagues' good performance will count against me |
| | If I share my "know-how" with my colleagues, I'm afraid that they may perform better than me |

Performance appraisal; Performance assessment; Performance evaluation; Performance management; Performance review

## Definition

Performance assessment is a method by which the work performance of an employee, a work unit, or

an organization is evaluated based on various performance indicators.

## Introduction

The incentives for rewarding better performing top-level executives are a key element of any country's strategy for sustainable economic and social development. To be effective, a well-developed system of performance assessment should underpin these incentives (Kim 2009). Performance assessment of high-ranking state and government officials at the regional level is a significant issue for the Russian Federation due to the country's vast land area and the great diversity among its regions (Kotchegura 2008). The governor is the head and chief government executive of each of the subjects of the Russian Federation (region, autonomous region, republic, and city). According to the country's Constitution, the Russian Federation consists of 85 subjects with the offices of "head of region" in each subject.

## The Mechanism of Performance Assessment of Regional Governors

Following the dissolution of the Soviet Union in the early 1990s and the formation of the modern Russian Federation, the system of strict federal control over the regions ceased to exist. However, a unified, balanced, and effective system of relations between Moscow and the regions did not replace it. The distribution of authority and duties between the federal and regional executive power agencies was not always clearly defined, which negatively affected the overall performance of the government and citizens' trust in federal and regional authorities. The country lacked a normative base that could provide equal rights to all subjects of the federation in their relationship with the central government. Moreover, the weak central government was not able to create and enforce the same "rules of the game" for the whole state. Consequently, some regions and their heads (governors, presidents, and mayors) enjoyed a privileged status in their relations with Moscow compared to other subjects of the federation.

In an attempt to restore the management capacity of the federal authority, the new president (elected in March 2000) established a system of federal districts in May 2000. Currently, there are 8 federal districts in Russia, each incorporating 6–18 subjects of the federation. A presidential envoy who is responsible for, inter alia, oversight of the executive leadership of the respective regions heads each district. Another measure to strengthen the "vertical hierarchy of authority" (enacted in 2004) replaced the system of gubernatorial elections by the population of the respective subjects of the federation with the system of appointment of governors by the president (Frye et al. 2014).

The system of a regular nationwide performance assessment of regional governors was introduced in the Russian Federation in 2007, with other significant public sector innovations within the framework of a large-scale reform package known as the "administrative reform." To be effective, this system comprised a mechanism of performance assessment based on 43 measurable socioeconomic indicators that generate a comprehensive picture of the situation in the selected areas of observation.

The newly introduced mechanism of performance measurement was intended to evaluate the extent of the success or failure of the governors' activities using economic and social metrics reflecting the rate and quality of development of the regions they managed. Among these indicators were growth in gross regional product, percentage of the population living below the poverty line, per capita new housing construction, education expenditures per pupil, crime rates, reduction of bureaucratic hurdles to doing business, and proportion of the population satisfied with the quality of services provided by regional and local administrations, among others.

The collected data were based mainly on statistical information provided by the Federal State Statistics Service of the Russian Federation and were used to draw up the performance ratings of the regional governors. The key objective was to

make career prospects and the job security of governors depend on the economic and social development metrics of a respective region, as well as on the extent of public approval of the activities of regional elites.

The mechanism of performance assessment envisaged that regions and their respective governors would compete for the highest ratings. Thus, this would ensure reappointment (reelection) of the heads of the subjects of the federation and additional "bonuses" to the regions. For example, such bonuses would come in the form of budgetary grants to those regions that received the highest rankings (Rochlitz et al. 2015).

The list of the abovementioned criteria was revised and expanded regularly so that by 2010, it included 319 performance indicators. It soon became evident that the system was too complicated, comprised too many indicators, and lacked clear-cut priorities. In addition, the selected approach ignored distinct, and sometimes profound, differences among the regions regarding their economic potential and dependence on external factors in their development.

The then President Dmitry Medvedev restored gubernatorial elections in 2012. However, the nomination of candidates continued to depend largely on the presidential administration, and a new signature-collection requirement, known as the "municipal filter," made it quite difficult for opposition candidates to register for elections without official backing (Golosov 2014). In-line with existing legislation, President Putin could dismiss regional heads and appoint "acting" governors, who then had to stand for election on a united election day in September of the respective year.

Consequently, in 2012, the existing assessment mechanism was substituted by another system that was generally more transparent and easier in application and considered the dynamics of the development of each of the subjects of the federation. This change allowed even the subjects of the federation with quite "modest" baseline characteristics regarding available natural resources, demographic situations, and development of industry and transport infrastructures to have real opportunities to reach top levels of respective ratings.

**Performance Assessment of Regional Governors in Russia, Table 1** List of indicators of the performance assessment of Russian governors, adopted on August 21, 2012, and amended on January 16, 2015

| | |
|---|---|
| 1 | Average life expectancy in the region |
| 2 | Amount of investment in fixed capital |
| 3 | Average annual unemployment |
| 4 | Volume of goods and services produced by small-size enterprises and individual entrepreneurs |
| 5 | Volume of tax and nontax revenues in the consolidated regional budget |
| 6 | Number of inhabitants |
| 7 | Real cash income of the population |
| 8 | Proportion of newly constructed housing against gross housing stock |
| 9 | Percentage of secondary school graduates who have not passed the unified state exam |
| 10 | Assessment by citizens of the performance of the regional authorities |
| 11 | Average mortality rate |
| 12 | Proportion of homeless children in state care institutions of all types |

Source: Tekhexpert Information Database (2015)

As Table 1 shows, the new list of performance criteria approved by the Presidential decree № 1199 "On Assessing the Performance of Executive Authorities in the Russian Federation Constituent Entities" on August 21, 2012, comprised only 12 indicators that reflected regional socio-economic and demographic parameters of development, as well as residents' opinion of the regional authorities' performance.

Initially, the task of drawing up ratings of the governors based on the above indicators was assigned to the Ministry of Regional Development of the Russian Federation. However, in 2012, this task was outsourced to the Civil Society Development Foundation (CSDF), a non-government organization. The latter used different sources to collect the necessary data, including population surveys, official statistics, and expert assessments. Polls were conducted to determine levels of public satisfaction with education, healthcare, government service provision, and the performance of regional administrations.

On November 14, 2017, President Putin approved new criteria for the performance assessment of governors by signing Presidential Decree

(Ukaz) № 548. As Table 2 shows, the list incorporated 24 key indicators. More importantly, the decree assigned public opinion the highest priority in evaluating the performance of regional authorities.

**Performance Assessment of Regional Governors in Russia, Table 2** List of indicators of the performance assessment of Russian governors, approved in November 2017

| | |
|---|---|
| 1 | Average life expectancy |
| 2 | Dynamics of average monthly wages |
| 3 | Ratio of average family income and costs of a fixed set of basic consumer goods and services |
| 4 | Percentage of population living below the poverty line |
| 5 | Coefficient of affordability of decent housing (number of years required for an average family of three persons to purchase a standard flat (54 $m^2$) |
| 6 | Percentage of newly arrived migrants (per 10,000 population) |
| 7 | Dynamics of birth rate |
| 8 | Crime rate |
| 9 | Quality and accessibility of communal services |
| 10 | Per capita gross regional product |
| 11 | Per capita volume of investment in fixed capital |
| 12 | Investment climate index |
| 13 | Ratio of average number of workers in small and medium enterprises to overall number of citizens in the region |
| 14 | Density of highways and roads meeting standard quality requirements |
| 15 | Per capita taxation revenue in the region |
| 16 | Ratio of the volume of state debt of the subject of the federation (region) to overall annual budgetary income of the region |
| 17 | Volume of outstanding payables under loans |
| 18 | Level of unemployment |
| 19 | Estimate by citizens of their and their children's opportunities for self-realization |
| 20 | Extent of customer satisfaction with the quality of services in education, healthcare, and social protection |
| 21 | Percentage of citizens who have encountered cases of corruption |
| 22 | Assessment by citizens of the performance of regional authorities |
| 23 | Assessment by citizens of the effectiveness of the activities of the national government |
| 24 | Results of independent assessment of the quality of services provided by public sector organizations |

Source: REGNUM News Agency (2017)

The system of regional governors' performance assessment, introduced and implemented during the years 2007–2017, comprised some positive elements: (1) many of the applied criteria were designed to "trace" the socially meaningful impact of the activities of regional governors, particularly, the enforcement of equity and social justice, as well as ensuring a high "quality of life," and, hence, reflected the interests of the majority of citizens in the respective regions; (2) the applied indicators covered various aspects of the governors' activities; (3) the collected data and ratings were open to the public, and the mechanism of collection was sufficiently transparent; (4) a number of indicators reflected public and expert opinion concerning the performance of regional administrations; (5) information pertaining to the dynamics of the parameters of development and public opinion was included in the applied methodology in addition to the static registration of these parameters; and (6) various NGOs participated in the process of compiling ratings assessing the performance of Russian regional administrations.

However, the newly developed system of governor performance assessment approved in 2012, and then expanded and modified in 2017, also had deficiencies. First, it comprised criteria that either largely overlapped (e.g., life expectancy, mortality rate, and population growth) or reflected outcomes that depended to a larger degree on external factors that were, mostly, beyond the control of the governors, for example, the level of unemployment in their regions. Second, the applied methodology envisaged that data would be collected to reflect 1-year cycles of the development of a region, and this complicated the assessments made within smaller time intervals. Third, as a rule, the adopted lists of criteria of performance assessment did not clarify what weight should be assigned to each indicator. Fourth, most measures and interventions undertaken by the governors and regional governments affected the targeted parameters and respective indicators only in the long run. As a rule, the indicators did not trace intermediate short-term results; yet, rewards and punishments were linked to annual improvements. Fifth, to a considerable extent, some of

the selected criteria were tied to the outcomes of the activities of federal government agencies and institutions, with regional governments playing only a secondary role in the achievement of these results.

Numerous studies point to the existing divergence between the formal and informal criteria used in the assessment of the performance of regional top-level executives in Russia. The existing practice of performance assessment of the heads of the subjects of the federation has not yet been established as an integral part of the HR management system. The information generated from the assessment procedure is often disconnected from performance improvement strategies and, more importantly, from key HR management decisions. In this context, the role of the public and the expert community in delivering their opinion, which could affect HR management decisions regarding the heads of the subjects of the federation, remains marginal.

## Conclusion

The methodology of Russian governors' performance assessment adopted and improved since 2007 is relevant and generally appropriate for the assessment of the activities of top-level regional executives. Simultaneously, the declared shift in the methodology of performance assessment of regional governors toward a decisive weight, which should be assigned to public and expert opinion concerning the socioeconomic situation in the respective region and the performance of its governor, has not yet been effectively realized in practice. Regular assessment of Russian governors' performance conducted by the federal government agencies and various NGOs yields data that are not considered in HR management decisions.

Within the framework of the adopted methodology, the new indicators of Russian governor performance approved in 2017 are, generally, relevant and justified, especially regarding their practical application in assessing key aspects of the professional activities of top-level regional executives. However, in the absence of a strong correlation between public opinion and trust (reflected in the major ratings) and governors' chances of remaining in office or being promoted, the significance of these indicators in motivating governors to ensure steady economic growth, resolve acute socioeconomic problems, and raise quality of life standards is weakened seriously.

# Performance Auditing

Åge Johnsen
Department of Public Management, Oslo and Akershus University College of Applied Sciences, Oslo, Norway

## Synonyms

Best practice audit; Comprehensive audit; Effectiveness audit; Value for money audit

## Definition

Performance audit is an evaluation that is based on decisions made or goals established by the legislature; concerns the economy, efficiency, and effectiveness of public programs or organizations; and may be carried out throughout the whole public sector.

Performance audits examine the economy, efficiency, and effectiveness of governments' programs, organizations, or activities for the purpose of improving transparency and accountability and making changes. Performance audit concerns both the local and central government, but central governmental audit institutions have often been dominant in the professional development of the performance audit, for example, by issuing standards. Performance audit spans activities in traditional financial auditing, inspection, and program evaluation. It can therefore be difficult to distinguish performance audit from traditional audit and program evaluation.

## Introduction

Performance audit is an independent examination of the economy, efficiency, and effectiveness of local and central governments' programs, organizations, or activities for the purpose of enhancing transparency, facilitating accountability, and improving the outcomes. Economy, efficiency, and effectiveness (the 3Es) have several definitions (Metcalfe and Richards 1990), but some common conceptualizations will suffice here. *Economy* means making savings in actual resource inputs relative to planned resource inputs; *efficiency* means that it would not be possible to produce more outputs with the same inputs, or alternatively it would not be possible to reduce the inputs without also having to reduce the outputs; and *effectiveness* means, simply put, the matching between desired objectives and actual outputs. Some would also introduce *equity* as a fourth E, explicitly making clear that the distribution and financing of the outputs are also important for social welfare. An important issue in practice is that effectiveness requires both economy and efficiency.

The definition of effectiveness that assumes given objectives for all sectors and services is often an unrealistic assumption in practice, however. Instead of assuming given objectives and that organizations will pursue goals rationally, effectiveness is also conceptualized more broadly as innovativeness, adaptability, organizational learning, and a capacity to manage change.

Performance audit concerns both the local and central government, but central governmental audit institutions have often been dominant in the professional development of the performance audit, for example, by issuing standards, in particular the International Organization of Supreme Audit Institutions (INTOSAI). INTOSAI's standards define performance audit as concerning the audit of economy, efficiency, and effectiveness embracing "(a) audit of the economy of administrative activities in accordance with sound administrative principles and practices, and management policies"; "(b) audit of the efficiency of utilization of human, nonfinancial and other resources, including examination of information systems, performance measures and monitoring arrangements, and procedures followed by audited entities for remedying identified deficiencies"; and "(c) audit of the effectiveness of performance in relation to achievement of the objectiveness of the audited entity, and audit of the actual impact of activities compared with the intended impact" (INTOSAI 2004, p. 11). INTOSAI also gives a shorter definition stating that: "Performance auditing is based on decisions made or goals established by the legislature, and it may be carried out throughout the whole public sector" (INTOSAI 2004, p. 11).

There are many types of performance audits, such as efficiency audit, program effectiveness audit, performance management capacity audit, performance information audit, risk assessment, best practice review, and general management review. Audit institutions may take on four typical auditor roles: the judge, the public accountant, the management consultant, and the evaluator. These auditor roles may affect the auditors' identities as well as the organization of the performance

auditing. The audits are often designed as projects. The issues or organizations that are selected for audit are chosen based on prior experience, political salience, economic importance, and risk assessments.

The impact of audit is a contested issue. The "audit society" proposition, based on observing the developments of an audit explosion in some countries, holds that organizations often use audits largely as rituals of verification that produce comfort (Power 1997). There is ongoing research on different dimensions of the impact of performance audit, including main effects on transparency, accountability, and improvement, as well as side effects and unintended consequences.

This article first discusses the difference between performance audit, traditional audit, and other evaluation. The article goes on to elaborate on different types of performance audits, the organization of performance auditing, performance audit products and the communication of these products, the impacts of performance audits, and challenges for performance audit. The last section concludes.

## Separating Performance Audit from Traditional Audit and Program Evaluation

Performance audit is an evaluation activity of a government program or organization that spans activities in traditional financial auditing, inspection, and program evaluation. It can therefore often be difficult to distinguish performance audit from traditional audit and program evaluation. There are different images of government and good functioning, primary goals and dominant modes of review, as well as different roles of the reviewers between traditional audit, performance auditing, and program evaluation, which can be used in separating performance audits from traditional audits and program evaluations. Barzelay (1997) discusses three images: bureaucracies, value chains, and government interventions.

The image of the organization in *traditional audit* is typically a bureaucracy machine. The audit reviews the transactions of the organization with the environment and its task performance in order to see whether they are effectively regulated by systems. The primary goals of the review in the traditional audit are compliance to regulations and accountability to owners. The auditor's role in traditional audit is verifying information, finding mismatches between the organizations' practices and regulations, inferring consequences of the mismatches, and reporting the findings.

The image of the organization in *performance auditing* is the value chain. The value chain is a term often used by managers, where political scientist may use policy program, social scientists use social system, economists use production model, and evaluators use effect chain. The image of good functioning in performance auditing is that the organization and practices in converting inputs, through activities, into outputs and eventually outcomes, are optimal. The primary goals of the performance audit review are hence the performance of the value chain and its accountability. The dominant mode of the review is inspection, and the auditor's role is evaluating different aspects of the value chain (program, system, production), including different organizations involved, and reporting the findings.

The image of the government in *program evaluation* is government-steered interventions in collective problems. The program evaluation therefore reviews whether the intervention, typically a public policy using different policy tools, achieves its goals, which are improving collective well-being and social welfare at large. The dominant mode of review in program evaluation is research. The auditor's role in program evaluation is therefore the evaluation of the effectiveness of the interventions or measuring the impact of different interventions on the collective problems addressed as well as their side effects and unintended consequences.

## Types of Performance Audits

Performance audit consists of many different types, largely compliance, activity, and performance-oriented types. A more detailed typology has

seven different types: efficiency audit, program effectiveness audit, performance management capacity audit, performance information audit, risk assessment, best practice review, and general management review, all using different units of analysis, modes of review, scope of evaluation, and focus of effort (Barzelay 1997).

The *efficiency audit* analyzes organizational functions, processes, or program elements by inspecting different aspects of operations between a government or a public sector organization and "third parties." It aims at identifying opportunities for lowering costs and reducing budgets in delivering program outputs. The *program effectiveness audit* inspects policies, programs, or major program elements that will affect performance of managerial functions. It aims at assessing the impact of public policies by evaluating the programs' effectiveness. *The performance management capacity audit* inspects different governmental organizations that affect performance of managerial functions in the programs. The aim is assessing the organizations' capacity to achieve the three generic goals of economy, efficiency, and effectiveness (3Es). The *performance information audit* audits a governmental organization's nonfinancial information generated by the performance measurement and reporting system. Its aim is validating and attesting (verifying) the accuracy (reliability and validity) of the information provided by the organization's performance management. The *risk assessment* inspects all aspects of a program's design and operation. The aim is identifying major risks of program breakdown and their sources. The *best practice review* researches whole sectors, generic processes, or common functions in order to illuminate certain aspects of organizations and programs, such as their activities, processes, or outputs. It aims at formulating sector-specific standards of best practice and revealing relative performance of the participants in the review. Finally, the *general management review* inspects selected aspects of an organization's structures, systems, and programs aiming for assessing the capacity of the organization to delivering upon its mission and policy mandates.

Hence, the different types of performance audits evaluate governmental programs and organizations' processes and outputs with regard to economy, efficiency, and effectiveness; verifies information relating to the economy, efficiency, and effectiveness of these programs and organizations; as well as inspects the programs and organizations capacities to achieve goals, deliver on missions, and fulfill mandates with economy, efficiency, and effectiveness.

## The Organization of Performance Audit

Besides the diversity of performance audit types, audit institutions may also take on several roles. There are four typical auditor roles (Pollitt et al. 1999): the judge/magistrate, the public accountant, the management consultant, and the researcher/scientist (evaluator). These roles will typically affect the auditors' identities as well as the preferred organization of the performance auditing.

The organizational design of the performance audit may be conceived as having two dimensions: one dimension is related to how the production of the audit (the supply side) is organized, and the other dimension is related to how the users of the audits are organized (the demand side). A common typology uses four constitutionally different forms of Supreme Audit Institutions (SAIs): a court with a judicial function, a collegiate body without a judicial function, an audit office headed by an auditor-general within the executive government, and an audit office headed by an auditor-general outside the executive government, reporting to the parliament or a parliamentary subcommittee (Pollitt et al. 1999). The SAIs' production forms of the performance audits may for simplicity be categorized into two groups: the courts of audit or collegiate body group and the national audit office form. The court of audit form is often used in Continental Europe in countries with a *Rechtsstaat* or Napoleonic law tradition, for example, in Belgium, France, Germany, the Netherlands, Portugal, and Spain. The national audit office form is often used in

countries that were more active new public management reformers from the 1980s onward, such as Australia, the Baltic countries, New Zealand, the Nordic countries, the UK, and the USA. Some audit offices have been reorganized from being within the executive to being outside and reporting to the parliament in order to be more fully and formally independent from the executive.

The second dimension in the organizational design of the performance audits is related to how some of the main users of the audits, e.g., the parliaments, organize their handling of the audits. Also here two forms are discerned: the public accounts committee model (PAC model) and the non-PAC model. The PAC model means that the SAIs submit their audits to one specific, standing parliamentary committee, often termed the public accounts committee, as in the British parliament. The Westminster model in the UK has subsequently spread to many other countries, for example, to Norway. The PAC model results in powerful PACs and is effective for naming and shaming. Albeit seen as superior in pursuing accountability and holding ministers to account, the PAC model's usefulness for enhancing organizational learning and contributing to improvement is uncertain. In the non-PAC model, the SAIs submit their audits to the parliament as such. With no apparent powerful "sponsor" within the parliament, the SAI may lose impact and seek alternative backers in order to disseminate their messages. In Sweden, using a non-PAC model, the relative newly formed SAI sought to use public media such as newspapers to disseminate their findings, a process that may have compromised the SAI's legitimacy and perceived independence, at least temporarily (Bringselius 2014).

Considering that performance auditing span many types, the auditors may emphasize and perform different roles, the audit may be organized in different ways, and the auditors may have different professional backgrounds and identities. Traditional auditors used to be accountants, but the staff conducting performance auditing is often trained in social sciences, namely, political science, sociology, and anthropology, or in management and economics. Depending on training and departmental affiliation, the staff may take on different identities associated with the auditor roles, such as judges, accountants, management consultants, or evaluators. In addition, other stakeholders such as parliaments, ministries of finance, and private auditors may also have interests in the performance auditing in the public sector. There is therefore ongoing struggles or competition for jurisdictions, roles, and identities within the audit institutions and the government, as well as between auditors in the private and public sectors (Guthrie and Parker 1999; Jacobs 1998; Jeppesen 2012).

In order to institutionalize performance auditing in the established audit institutions' practices, which often have a strong tradition of financial audit, many audit institutions have chosen to specialize by having some departments for financial audits and some departments for performance audits. There usually also are administrative departments and there may also be specific departments for methods and development. The audit institutions therefore have several strategic and organizational design choices when organizing their performance auditing. For example, a comparative study of four Nordic SAIs showed that among four strategic options – a performance auditing strategy, a financial auditing strategy, a portfolio strategy, and a hybrid strategy – three SAIs had adopted a portfolio strategy and one SAI had adopted a hybrid strategy (Jeppesen et al. 2017). Whether these configurations are stable or typical remains to be seen, and warrants more research, but there is considerable interest from consultants and accountants to overtake at least some of the performance auditing, not necessarily as traditional audits or as performance audits but as consulting.

## Performance Audit's Products and Communication

The performance audits are often decided by the auditors-general in the SAIs and by municipal control committees in the local government in

order to upheld independence. Some audit institutions may allow other parties to suggest issues or organizations for audit, and some parliaments also reserve the right to be consulted on the choice of the audits. Typically, the audits are designed as projects, and the issues or organizations that are selected for auditing are chosen based on prior experience, political salience, economic importance, and risk assessments. If a preliminary analysis indicates an interesting issue, the performance audit goes forward using carefully designed methods. There may be several meetings and different methods of data collection, and the auditees are invited to comment on the draft reports in a "clearing process" before the final audit reports are submitted to the parliament (Keen 1999; Pollitt et al. 1999).

Politicians and policy-makers often experience information overload. In order to reach out to interested parties, as well as keeping the audit institutions' independence, many auditors utilize media communication strategies. Such media communications strategies may seek to serve the SAI's overall strategy, demonstrate the results of the SAI's activities, facilitate the freedom to address different stakeholders, enhance impact of the audits, and enhance transparency and equal access to high-quality information. Audit institutions also complement their traditional product, the audit report, with different communication actions such as publishing annual reports, providing website archives, utilizing press offices, publishing press releases and – when there are especially important audits – holding press conferences, getting or participating in peer review reports (review of an audit institution by sister organizations), providing answers to frequently asked questions (FAQs), and utilizing social media such as Facebook, Twitter, YouTube, and Flickr, for disseminating information (González-Díaz et al. 2013).

## Impacts of Performance Audits

The impacts of audit have been a contested issue since the mid-1990s. Echoing the development in new institutional sociological theory from the mid-1960s, the arguments are that many organizations adopt different and sometimes conflicting processes and structures that to some extent are rituals and symbols in order to conform to different and sometimes conflicting values and norms in the environment, more than heeding to effectiveness can explain. Such adaptations may result in decoupling between the technical operations of audit and its impacts and the image of the audit and its impacts. Studies of the US General Accounting Office (now the US Government Accountability Office) found complex relationships, but these relationships were more loose couplings than decoupling (Basu et al. 1999).

The audit society proposition, based on observing the developments in auditing in the UK, holds that organizations often use audits, but that the audits largely are rituals of verification that produce comfort (Power 1997). Part of this proposition is an effort to explain the large increase in the use of audits in different sectors of the society during the 1980s and 1990s, the so-called audit explosion. Some of this development can be explained by public management reforms that typically shifted emphasis from rules and hierarchy to outcomes and competition. These reforms often involved policies and programs for devolution of powers within the public sector and decentralization of authority and empowerment of managers within organizations. The increased emphasis on devolution, decentralization, and empowerment also unleashed a need for more control of outputs and outcomes in order to keep democratic control of public resources. Hence, policy tools for measuring and managing performance gained prominence in the public sector, including performance management, performance audit, and evaluation. Moreover, some argued that much of this development led to an increased use of accountants and consultants in audit in the public sector, but with largely symbolic outcomes. That the "audit explosion" has had tremendous impact is, however, little disputed. The audit society has forced many organizations and practices "to be made auditable" meaning that the entity needs to have clear formal boundaries, and the practices and processes often have to be codified and standardized, for example,

to be amenable for scrutiny by ticking checklists in inspections, as well as changing the identities of the auditors from traditional accountants to performance auditors and modernizers (Skærbæk 2009). Much of this audit has produced comfort but has also produced discomfort when there has been discovered mismatch between practices and norms, performance below par, and misuse of public money.

Measuring and assessing the impacts of public policies and programs and their accompanying use of policy tools are notoriously difficult. This can partly explain why, approximately 20 years after the "audit explosion" in the mid-1990s, there are still few empirical studies of the impact of performance audit in the government (Van Loocke and Put 2011). Some of the few empirical studies that exist have, however, showed some positive but varying impacts of performance audit on public administration in different countries (see, e.g., Johnsen et al. 2001; Morin 2001, 2010, 2016; Raudla et al. 2015; Reichborn-Kjennerud 2013, 2014; Reichborn-Kjennerud and Johnsen 2011, 2015; Tillema and ter Bogt 2010). A comparison of performance audit practices in the Regional Audit Institutions (RAIs) and SAIs in Europe showed that there were institutional and maybe cultural factors determining some impacts. RAIs and SAIs that practiced performance audits in an Anglo-American model (the "UK-Nordic group") or a Germanic model (the "Germanic group") had positive impacts from the recommendations included in their performance audit reports. The Anglo-American model emphasizes following-up the audit processes and the implementation of the recommendations. The Germanic model has impacts based on parliaments' promoting reforms. The RAIs and SAIs in the French group and in the "other" group had low performance audit activities, the audit reports were rarely presented in parliament, and there were little following-up of the audit recommendations. There was therefore little impact of the performance audits in these two groups (Torres et al. 2016).

Assessing the impacts of performance audits, defining which dimensions of impact one wants to assess, and measuring these dimensions with accurate data are conceptually and empirically challenging. The RAIs and SAIs themselves, however, regularly survey their auditees about the following-up of the performance audits sometime after the audits have been finished. These data are seldom made public, but would be an interesting data source for future research. The approach often used in the research literature is interviewing or surveying the auditees, but interviewing or surveying the auditors themselves about the impacts has also been done (Lapsley and Pong 2000).

## Challenges for Performance Audits

There are some persistent challenges for many auditors. One challenge is the balancing act between independence from other stakeholders and responsiveness to their needs and inputs into the audit process (Lonsdale 2008). Some stakeholders may want to shape the focus or criteria for the audit, have valuable information for the audit, act as subcontractors, are involved in consultations during the audit process, or are important for disseminating the audit information (Jacobs 1998; Reichborn-Kjennerud and Johnsen 2011; Tillema and ter Bogt 2010). These issues may be perceived as having impacts for the auditors' independence and the audit quality.

A second challenge is the need for being seen as independent in order to be able to be legitimate in publishing "bad news" or "naming and shaming" in a political and partisan context, while simultaneously having a mandate to contribute to improvements that effectually requires an ongoing and close relationship with the auditees (Barzelay 1997). Some research indicates that the impact on improvement varies between countries. How the auditors chose their auditor role, how they are organized, and how they design the audits may affect their perceived independence and impact of the performance audit on improvements.

A third challenge is to design and practice the audits in such a way that also corruption and financial misconduct are detected. Detecting

corruption has been low on the auditors' agenda, maybe because it is costly to detect corruption and requires investigative methods that traditionally have been seen as police work rather than audit. Corruption nevertheless affects economy, efficiency, and effectiveness, as well as infringes upon transparency and accountability. Therefore, detecting, if not investigating, corruption should fall within the remit of audit, including performance audit.

## Conclusions

In the traditional audit, independent accountants verify organizations' financial information in relation to standards in order for other parties, including owners, potential investors, governments, and the public at large, to be able to trust the information given by management. Performance audit is much more concerned with nonfinancial information and has often more ambiguous standards than traditional audit. Moreover, the purpose of the performance audit is often providing transparency in order for the parliament to be able to hold someone, typically the responsible minister, to account, as well as for facilitating organizational learning and improvement throughout the government. Despite hard to assess, all these purposes may have substantial impact on politics and public sector management, both through their direct effects and through their preventive effects. Therefore, maybe one of the most interesting as well as challenging issues in accounting and auditing is what would happen if there was no, or different, accounting and auditing regulations and practices.

# Performance Audits and Performance Appraisals

Eric E. Otenyo
Northern Arizona University, Flagstaff, AZ, USA

## Synonyms

Employee appraisals; Performance evaluations; Personnel review systems

## Introduction: A Historical and Comparative Perspective

Perhaps our colleagues, superiors, or subordinates all constantly rate us subconsciously. Yet, despite this inevitable tendency, a formal performance appraisal is not very well understood and often poorly managed in some well-respected organizations. Administration of performance appraisals can involve emotions and is one of the difficult aspects of managerial and supervisory responsibilities.

Records show that formal appraisal systems existed as early as the third century A.D. At that time, the Chinese bureaucracy engaged in a form of performance appraisal practice in which an imperial rater evaluated the emperor's official family members and servants on a nine-grade system based on his likes and dislikes. In Europe, formal appraisals began around 1800 in the cotton mills of Scotland. Then, workers were rated according to color tags, white for excellent, yellow for good, blue for indifferent, and black for bad.

Performance appraisals in the public sector of the United States began in 1813 when Army General Lewis Cass submitted to the War Department an evaluation of each of his men, described in terms like "good-natured" or "knave despised by all". The emphasis was on traits such as intelligence, initiative, energy, appearance, and responsibility. Appraisals in the civilian sector of the federal government were initially introduced in 1842, a time when reformist movements were hardly known. This was also before the introduction of the federal Civil Service system in 1883, when the Pendleton Act was signed into law. The Post Pendleton era witnessed the adherence to the Civil service paradigm, grounded in a merit system. From then on, city governments also introduced merit systems undergirded by performance appraisals. For example, New York City revised its Charter in 1975 to incorporate a new appraisal system. In the end, these procedures became the norm at all levels of government, and they became an important practice in human resource management. Performance audits and appraisals are rooted in the belief that evaluation of employees is the best way to establish and reward merit, and most employers associate performance appraisals with the promotion of efficiency.

Although different systems are employed to suit a variety of needs of work organizations, there are some common features in these appraisal systems. They are promoted as a management tool for determining how an individual is performing. It is the process by which organizations measure and evaluate individual employees' behavior and accomplishments for a certain time period.

Much of the modern basis for performance appraisals in the civil service is grounded in law, especially the spirit of the Civil Service Reform Act of 1978. The law stipulates that:

> Each agency shall develop one or more performance appraisal systems which (1) provide for periodic appraisals of job performance of employees. (2) Encourage employee participation in establishing performance objectives and (3) Use the results of performance appraisal as a basis for training, rewarding, reassigning, promoting, demoting, retraining, retraining and separating employees. (Ammons and Rodrigues 1986, 460)

Through this legislation, the US government moved to reaffirm the performance and merit-based administrative paradigm. Chapter 43 of this law requires federal agencies to develop performance appraisal systems that would encourage employee participation. After 1978, the adoption of performance appraisal systems and practices proliferated in the civil service.

What are the two critical audiences of performance appraisal practices and processes? The first audience consists of practitioners, often-human resource professionals who are charged with designing, implementing, and evaluating employees. These are mainly supervisors and managers. A second audience consists of academics and hired consultants whose preoccupation is to generate knowledge and prompt a reform movement in the enterprise. The weakness of the latter audience is to focus on what characterizes an effective performance appraisal system. Far too many consultants and training gurus have shared their expertise on what works or does not work. There are hundreds of templates on designing company and organizational performance appraisal systems. And there are checklists of best practices including those that answer questions on legal frameworks for successful performance appraisal and audit management.

Because of the technical, as well as the flawed, nature of performance appraisal production and applications, a network or ecosystem has emerged involving developers, implementers, researchers, and other entities. Larger jurisdictions have experts who can develop performance appraisal tools in-house. Smaller governments can call on consultants to create a reliable and valid evaluation system. Professional organizations, like the International Public Management Association – Human Resources (IPMA-HR), provide a professional climate where old and new approaches can be tested and shared. Supervisors in the line agencies, who have to conduct the performance appraisals, are valuable resources as well. Finally, there are academics with a special interest in the subject matter.

Among the core issues of performance appraisal systems are measurement processes, contextual factors involving participants,

comparisons of practices, and implementation challenges. Not all issues of performance appraisals and audits receive equal treatment in the literature. To understand the core issues and applications of performance appraisals in public administration, our attention is focused on responding to the key questions of *why* and *how* it is done, and whether or not appraisals deliver on prescribed promises. Stated differently, those are three themes, which may be considered central to understanding performance appraisals in public administration.

These three themes are not mutually exclusive. Scholars have also devoted considerable efforts to explain, in a general sense, the underlying assumptions of performance appraisals in organizations. Since there exists no consensus on any of the three broad questions, the task is to examine the major intellectual arguments in those three areas and show relevance to public administration practice. Such an approach does not in any way relegate the significance of the performance appraisals management in nonprofit and private sector organizations. If anything, the nuts and bolts of performance appraisals systems remain strikingly similar in most organizations. However, the research is often limited because employers can refuse access to their employees.

## Why Is It Done?

Performance audits and appraisals are being called upon to do more than they can deliver. However, the practice is an almost universally accepted fact of organizational life. There are several reasons why managers select to carry them out. Performance appraisals can be used for purposes of counseling, staff development, promotions, and sanction functions. There is fair amount of consensus among supervisors and employees on what the purposes of performance appraisals should be. For example, managers may use appraisals to make training and placement decisions. Several studies suggest that performance appraisals find favor with both employees and employers, mostly for feedback (communication) purposes. That is, appraisals help management and staff to communicate with each other and start processes of solving organizational problems.

Academics who study the rationale for performance appraisals report that the most frequently listed purpose for performance appraisals is to provide justification for decisions concerning promotions, demotions, and layoffs, as well as manpower planning and utilization. In a similar vein, emphasis is on evaluations for purposes of rewards, counseling, and development. Another prominent reason for performance appraisals is to generate data for the human resources departments for formal tasks such as compensation and work force structure, job redesign modularization, changing workforce standards, transfers, and performance targeting for groups and organizational productivity.

In sum, the main goals and objectives of performance appraisals are threefold, to decide on rewards, to determine areas for future development, and to communicate on organization matters. These goals have corresponding objectives. For example, decisions on rewards correspond with decisions about promotions and terminations. Development goals are closely associated with making decisions about training needs, counseling, and career planning. And in the arena of communication, the corresponding objectives include provision of feedback to supervisors and to allow the employee to discuss performance according to set targets, contracts, or norms. It follows that performance appraisals provide supervisors with information to address concerns such as when a subordinate's performance is below the expected level. Then, supervisors have to set up performance appraisal interviews to communicate performance while not losing sight of the need to motivate employees.

## How Is It Done?

Studies on how performance appraisals are done vary from discussions on frequency and timing for a "good" appraisal outcome to *actual how* to do it manuals. Consultants and career coaches publish a variety of Internet-based manuals on best

practices and advice, including YouTube channels and PerformanceReview.com, Career Builder.com.

From an organizational perspective, performance appraisals embrace many techniques, which are frequently designed on the basis of the purposes and intents of the organization's management. While there are numerous ways of describing how appraisals are done, no list can be exhaustive. In practice, combinations of methods are most popular. To illustrate, a few examples of methods of performance evaluation are described below in the following order: critical incidents, checklist methods, narratives, rating scales, behaviorally anchored rating scales (BARS), management by objectives (MBO), and 360 degree appraisals.

### The Critical Incident

Among the important methods of doing performance appraisals is the critical incident. It discusses specific actions and accomplishments. It is appropriate for the appraisal of professionals who are assessed on specific projects and outcomes.

### Checklist Methods

These are about checking off behaviors that apply to those being evaluated. The appraiser merely checks off "yes" or "no" to listed specific questions. In order to minimize bias, the raters are different.

### The Narrative Approach

Is the first approach that can realistically be considered an appraisal, because it is evaluative as well as descriptive. In this instance, the appraiser not only writes a narrative description of the individuals' performance using specific incidents where necessary but also containing adjectives like "excellent," "unsatisfactory," "engaging," "superior work," "outstanding," and so on.

### Rating Scales

Rating scales are the most widely used appraisal method in public administrative settings. Judgments about performance are recorded on a graphic scale, usually consisting of five to seven points, from low to high. Raters may vary in their judgments but should always strive to be fair and avoid capricious and arbitrary evaluations.

### Behaviorally Anchored Rating Scales (BARS)

Schwab et al.'s (1975, 549–562) work remains a significant effort to review the literature on this particular performance appraisal technique. BARS use the rating scale, but instead of adjectives at each scale point, behavioral anchors related to the criterion being measured are well used. By using observable behaviors instead of adjectives, the meaning of each point on the scale is clarified. The raters do not need to imagine what outstanding performance is – they see as actual example in the behavior anchor. BARS is also a boon to the performance discussion. Because behaviors are much easier to discuss than adjectives, the performance discussion can deal with specific activities that need attention. Regardless of its popularity, BARS has some weaknesses. For example, despite the intuitive appeal, findings from research have not been very encouraging in areas such as leniency, dimension independence, and reliability.

### The Scaled Comparison Method

The scaled comparison is another methodology for appraisal. Also known as objective judgment quotient (OJQ); it involves the comparison of two individuals on a certain criterion. For instance, if the rater thought X's performance was much better than Y's, the space on the rating form nearest X's name would be checked. If Y's performance was seen as better than X's, the space nearest Y's name would be checked. If it was a draw result, then the middle space would be checked.

### Management By Objectives (MBO)

Associated mostly with Peter Drucker's (1954) work in *The Practice of Management*, MBO systems set goals for both personal development and for work activities. The supervisor evaluates the employee in terms of accomplishing those goals. Quite often periodic review sessions are prescribed rather than just an annual or semiannual appraisal interview. Additionally, the employee and the manager engage in an interactive process, with both contributing to goal setting and

subsequent evaluation. MBO is most widely used in Industry, particularly at the higher levels. By 1985, it was the state of the art technique but has since declined in popularity. Those who embraced MBO techniques saw it as an objective and participatory device for gaining employee support in the distribution of organizational rewards. MBO methods are rarely used in public organizations.

### 360 Degree Appraisal

This option refers to analysis of individuals' performance from multiple perspectives and all angles. The process takes into consideration feedback accounts from the employees' self-evaluation and the viewpoints of supervisor, subordinates, clients, and peers. The idea of 360 degrees emerged in the early 1970s when promotion of team-based work places was in vogue. The major criticism of this approach is that it takes much time to conduct the evaluations. Although we have described some of the appraisal methods in practice, there is no agreement about the one best way. Each method has its strengths and weaknesses.

Human resource management specialists lead the process for organizations during the 10th through 12th month of an annual period. Typically, performance appraisals involve planning and evaluation procedures. In general, human resource specialists often view performance appraisals as a six-step sequence. The sequence, outlined below begins and ends with the personnel function aimed at assisting in administrative decision-making processes. The six-step approach from a manager's point of view is:

1. Personnel or management distributes performance appraisal online or off-line forms to unit heads manager
2. Manager completes form on employee
3. Completed form is reviewed by second level manager
4. Information on the form is shared by manager
5. Completed form is returned to personnel
6. Form is used for employment decisions

Studies on feedback process explain that the performance appraisal is an important part of the appraisal process. The focus tends to be on criteria of rating and degree of participation by employees. Additional variables include the characteristics of employees and supervisors, nature of jobs, conditions within the organization as a whole, and the frequency of the review process. Generally, supervisors want more frequent evaluations than subordinates. Among the variables influencing review are the needs of the agency, levels of experience, clarity, newness of the employee, time available for review, and organizational policies. Newness refers to things such as new computer programs, which both parties have to learn really well. Increasingly, appraisal systems are conducted online and require investments in software packages that showcase employee productivity in formats accessible to supervisors and managers. A supervisor who really does not understand the nature of work performed by subordinates is unlikely to contribute effectively in an evaluation interview. It is also well known that employers need to develop and apply evaluation instruments that are objective. As Nalbandian (1981, 392–396) observed, subjective evaluations are common and reflect poorly on appraisal systems. In particular, trait-based judgments about employees easily lend themselves to court challenges. Again, the literature is replete with legal advices on implications of non-compliance to common principles of justice and equity throughout the evaluation process.

To ensure justice and fairness, employees are often offered opportunities to comment on appraisals and evaluations, mostly in meetings with their superiors. Concerning scheduling of appraisal interviews, experts advice managers to divide meetings into two sessions. The first should be for evaluation and the next allocated for improvement issues. Both of these interviews rely on intense employee participation and some advance planning. Such an approach alleviates most of the stress associated with interviews. However, considerable debate exists over whether performance evaluation and developmental coaching should be conducted in the same interview. Critics contend that interviews do not bring out the differences between judging and counseling. For the most part, employee evaluation

should not be incorporated in the training needs assessments because the two activities are different.

J. Peter Graves advised managers should put back appraisal in performance appraisal (1982, 918–923). He examined the methods of appraisals that compared the performance of one person to another to ensure reliability in the process. He argued that a comparative method was more reliable because sources of unreliability are controlled. The raters made remarks about one person's performance consistent with evaluations of others in similar ranks and positions. A reliable evaluation can be discerned if ratings look the same whether performed by a trained or untrained manager. Moreover, ratings are expected to be the same whether these are used in feedback sessions or kept as confidential employee reports for management uses. Ratings should also be the same whether the appraisal was performed in morning hours or on Friday afternoon. It must be emphasized that reliability is an important ingredient in conducting good appraisals and performance audits.

Perhaps, for practitioners, more important than reliability is validity as criteria for assessing worker performance rating (Marcoulides 1989). Validity refers to the extent to which the appraisal instrument measures what it is supposed to measure. Specifically, content validity is assumed to be present when an instrument includes the most important job performance behaviors and results thereof.

## Has It Delivered on Its Promise?

The important academic and practical question is whether techniques for performance appraisals have delivered on their promises. There is a vast body of literature that suggests performance appraisals are one of the reasons why human resource management is not popular. From an international perspective, cultural factors have made conducting effective performance appraisals even more challenging (Bailey and Fletcher 2008; Caliguiri 2006; Claus and Briscoe 2009). At the international level, goals for performance appraisals and values are shaped by national cultures, and capacities of organizations to achieve them vary considerably from one locale to another. With increased globalization, practices in different settings may be similar, therefore, minimizing the general criticisms leveled against appraisal systems. Some even argue performance appraisals should be disbanded because the process has much to do with subjectivity. Performance appraisal is a judgmental process of evaluating the performance of another. If and when the appraiser chooses to share the evaluation with the person evaluated, then we have a performance discussion or a feedback session.

An alternative framework of analysis raised concerns about the fact that people's feelings are involved in the performance appraisal process and make judgments that may be subjective or skewed in one way or the other. Specifically, *trait*-based systems lend themselves to bias judgments. Evidence suggests that bias can come in many forms. It can be because of age, religion, ethnicity, national origin, race, personal appearance, accents, sexual orientation, motherhood, and disability status. Experts know that variables such as race and age are not necessarily good predictors of a worker's performance, yet some raters reflect those biases when conducting performance evaluations of people of color and senior colleagues.

Research also shows smoking employees have been rated lowly regardless of the fact that smoking is not necessarily associated with employee's productivity (Gilbert et al. 1998, 285). The latter found out that smoking stigma may negatively affect perceptions of one's overall job performance, especially in terms of one's professional comportment, working relations with others, and dependability. This interesting finding was based on research comparing performance ratings of smokers and nonsmokers in organizations. Otenyo (2012) added tattooed workers to the mix of areas of potential concern.

Besides rater bias and stereotyping, appraisals encounter the problem of response bias. The tendency has often been to move the ratees toward the center of the continuum scale. Thus, it is assumed, for the most part, that performance rates can be

fixed on a normal curve and some sort of central tendency exists. This action refers to the tendency of the rater to give average ratings rather than ratings of outstanding and unacceptable. Besides, there is the "halo effect," (halo error), which assumes supervisors have some preconceived notions of the employees working under them. Still, there are concerns over recency errors, which have to do with the notion that the more recent rating has a dominating effect on the subsequent performance. Performance appraisals are also criticized for unintended consequence or the "Matthew effect". This is the idea that employees who are rated favorably continue to receive the same high rating even when it is not justified.

Appraisers are also limited by the tendency to compare their subordinates to themselves or other colleagues (similarity error). In other words, some raters see themselves as the yardsticks to measure the performance of those in their charge. There are other additional concerns such as rater leniency (inflating ratings) and the lack of objective data, which raise lingering questions about performance appraisals.

While the performance appraisal procedure has its critics, tying pay raises to performance evaluations is even more contentious. At one extreme is the claim that productivity measurements can be relied upon in rewarding good performers. Opponents point to research that does not find a relationship between merit pay and motivation. Some researchers suggest that federal merit pay policies have failed as a motivational program largely because of difficulties in the performance appraisal process. As Kellough and Lu (1993, 45–64) suggest:

> from the perspective of expectancy theory (V.H. Vroom) an accurate and equitable system for evaluating performance is essential to increase the perceived probability that good performance will lead to rewards. In the public sector, however, goals and performance criteria are often diverse, conflicting and difficult to measure.

Overall, there is the belief that before merit pay, employee performance appraisals focused primarily on identification of outstanding or unsatisfactory employees. Most employees received a rating "exceeded requirements, but not an exceptional degree," and since pay and performance were not closely linked, little emphasis was placed on the appraisal process. All in all, studies done by the Merit Systems Protection Board (MSPB) report that there was substantial dissatisfaction with the system. The same can be said with reference to appraisal systems in local and state governments.

Still, the main flaw of performance appraisals is that the process ignores decades of collective learning about human behavior in public organizations and relies upon pseudo scientific methods of measuring performance. In addition, the widespread use of intangible information complicates the rating systems. Categories like "satisfactory" and "outstanding" are ideas that can be challenged in science of knowledge terms. The appraisal systems imply that employees must be placed in some form of hierarchies even when the workplace promotes collaborative approaches to instituting workplace productivity. Critics argue that appraisals undermine strategies such as Total Quality management (TQM). As a result, performance appraisals may in fact promote dysfunctional competition among employees. W. Edwards Deming (2000) was an early opponent of performance appraisals and merit pay, arguing that they destroyed group cohesion and teamwork.

There are reported cases of worksites that use employee appraisals for organizational development and focus less on ranking and making comparisons between employees. But that logic is flawed on technical grounds. Whenever the organization makes a human resource management decision – a promotion, transfer, layoff, merit increase, or demotion – a comparative decision is somehow made. And since decision-making requires information, data for appraisal must come from some organizational process. Therefore, organizations that claim to use appraisals "for development" have to rethink their arguments about employee reviews.

## Suggested Reforms and Alternatives

Although performance appraisals are not perfect managerial instruments, appraisals retain some

seductive properties. The goal is not to create a perfect system but to minimize the various flaws in existing methods. The view that performance appraisals do not work is very prevalent and hence the search among human resource practitioners and scholars to find a better ways to evaluate employees. A professor at the University of California, Samuel Culbert (2010) wrote a book declaring that it was time to get rid of performance reviews. His argument was that appraisals were one-sided analysis by managers. Among the suggested reforms is the inclusion of greater peer review systems and improved communications between subordinates and their supervisors.

Other alternatives involve changing the process so that employees may be appraised on the basis of short-term performance goals rather than traits that are set by employers and the organization. There is also concern that appraisals generate much data that is not put to use. A good example is in the area of discrimination. Critics argue that decisions involving discrimination among individuals do not necessarily include reference to periodic evaluations embedded in the appraisal processes. This is the reason why performance appraisals are strengthened by court actions basing judgments on the Civil Rights Act of 1964 and the 1970 Equal Employment Opportunity Commission (EEOC) guidelines for the regulation of employment. Judicial interest in performance appraisals casts doubt about the proper way to evaluate and rate performance. It forces organizations to provide training in appraisal skills to minimize rating errors.

Today, organizations encourage training supervisors to be sensitive about how to relay information about poor performance to employees. Training in communicating poor performance to the employee, however, must incorporate elements of how to criticize constructively. This is an area where huge problems may arise. Experts suggest that improvements to the feedback process can help in making appraisals more amenable for organizational health. Yet, even if raters are trained, evidence suggests that attitudes and beliefs of both supervisors and subordinates toward performance appraisals have not changed much. Those involved in the process are not completely satisfied with the outcomes. Generally speaking, there is agreement among commentators that participatory goal-oriented performance appraisal systems are more effective and efficient than others. Employee perceptions about supervisory rating behaviors means that training must include methods of cultivating employee participation in setting performance standards, work goals, and the interview processes, which are part of human resource management. Without procedural fairness, performance appraisals do not mean much. It is the perception of fairness that provides employee confidence in the performance appraisal systems. Employee acceptance, in turn, is a key variable in enhancing satisfaction with the appraisal process and cultivating favorable outcomes relative to employee motivation and productivity.

Further, several organizations are turning to electronic performance monitoring strategies, sometimes called dashboards, to enhance accountability. Employees are observed using computer methods that may provide logs of time actually allocated for official business. The rapid expansion of electronic performance monitoring (EPM) systems is perhaps the hallmark of twenty-first century performance appraisal practices. These and other systems integrate productivity measurements with existing human resource information systems (HRIS) and similar platforms. Today, over 90% of all employees are monitored electronically often at the cost of employee privacy concerns. The net result is to align appraisal processes to organizational missions. Some public organizations, guided by professional societies, attempted to come to agreements on methods and criteria for rating employees in similar occupations. All these trends are meant to help avoid some of the problems associated with performance appraisals. However, the question of pinpointing an ideal or best appraisal method has no answer because each organization is different.

## Conclusion

Employee appraisals are a key aspect of human resource administration. There are several ways of conducting performance appraisals but each has

its strengths and weaknesses. The task for management is to conduct compelling appraisals that are accurate. This is because appraisals provide information that can determine management outcomes and decisions in many personnel functions. In sum, formal performance appraisals should never be utilized alone and uncritically, without due and complete consideration of the context in which the appraisal is being performed and used. Appraisals are a part of the human resource management decision-making process and should be done competently, within the law and with integrity and fairness.

# Performance Budgeting

Ringa Raudla
Ragnar Nurkse School of Innovation and Governance, Tallinn University of Technology, Tallinn, Estonia

## Synonyms

Performance-based budgeting; Performance-informed budgeting; Results-based budgeting; Results-oriented budgeting

## Definition

Performance budgeting refers to a budgeting system that takes into account performance information in budgetary decisions.

## Introduction

Performance budgeting (also called performance-based budgeting, results-oriented budgeting, results-based budgeting) is a rather elastic term that encompasses different ways of linking performance information and budgeting in the public sector (Curristine 2005; Schick 2003, 2007, 2014). Performance information (PI), in turn, refers to "systematic information describing the outputs and outcomes of public programmes and organizations . . . generated by systems and processes intended to produce such information"

(Pollitt 2006, p. 39). Outputs are immediate results of government programs, whereas outcomes refer to broader impacts.

In the *broadest* sense, the label performance budgeting (PB) is used to describe any arrangement where performance information is added to the budget documents, alongside financial information. More specifically, PB takes three different forms: (1) presentational PB; (2) performance-*informed* budgeting, and (3) *direct* performance budgeting (e.g., Curristine 2007; Hawkesworth and Klepsvik 2013). In the case of *presentational performance* budgeting, performance information is published together with budget documents but is not expected to explicitly be taken into account in funding decisions. Instead, the goal of disseminating PI is to promote accountability and increase transparency in the public sector. In performance-*informed* budgeting, performance information is systematically taken into account in funding decisions, but the link is not automatic: performance indicators alone do not determine the size of the allocations and their weight depends on the circumstances. *Direct* performance budgeting refers to a system where the amount of resources allocated to an organization directly depend on the results it has achieved. The most extreme case of it is *formula funding* where the allocations are calculated on the basis of a formula that takes into account the achieved outcomes or outputs.

The adoption of performance budgeting systems is an important reform trend in the organisation for economic cooperation and development (OECD) countries but also elsewhere (Berry 2007; Curristine 2007; Hawkesworth and Klepsvik 2013; Sterck and Scheers 2006). The pioneer in performance budgeting was New Zealand, which started experimenting with it already in the 1980s. Australia, Canada, Denmark, Finland, the Netherlands, Sweden, the United Kingdom, and the United States then began to adopt the reform to varying degrees during the 1990s (Curristine 2005). Many other countries have followed suit since then. Today, roughly two-thirds of OECD countries have issued guidelines for performance budgeting (Schick 2014). However, we still cannot talk about one uniform model of PB (Schick 2014). Each country has adopted its own version, and the elements of the performance budgeting system vary considerably between governments. Furthermore, even the most "advanced" reformers cannot claim that their PB system is "finally ready." Instead, they are still in the process of changing their systems (Curristine 2005; Schick 2014).

Its promise to increase the efficiency of resource use makes PB particularly attractive during times of financial strain when reformers are looking for ways to "do more with less" and to cut expenditures in a "rational" way (Hawkesworth and Klepsvik 2013; Pollitt 2010). At the same time, the implementation of PB has often faced a number of difficulties, leading to disappointments and even reform reversals. The goal of this chapter is to give an overview of the advantages of PB, the challenges involved in implementing it, and the potential negative consequences it can lead to.

## The Advantages of Performance Budgeting

Performance budgeting was brought onto the public sector reform agenda by the New Public Management movement (Berry 2007; Pollitt and Bouckaert 2004). The core goals of New Public Management have been to increase the economic efficiency and effectiveness of public sector organizations. According to its advocates, performance budgeting has a number of advantages (Curristine 2005; Pollitt 2001; Robinson 2007).

First, it is often argued that PB promotes transparency in the public sector and helps to reveal what is actually achieved with taxpayers' money (Andrews 2004; Berry 2007; Hawkesworth and Klepsvik 2013). If PB is used, public officials have to communicate their performance targets at the beginning of the budget cycle. This, of course, necessitates the reporting of actual performance and the extent to which performance goals were met once the fiscal year has concluded. Doing so is expected to promote increased awareness of what different government programs actually cost and what benefits they accrue.

Second, PB can help to put pressure on public sector organizations to achieve better results. If

the public officials know that the size of their budget depends on the results they deliver, they are motivated to be more results oriented in their activities (Ammons 2002; Robinson 2007).

Third, PB is purported to alleviate problems arising from *incrementalism* in budgeting and reduce inertia in the funding of programs and policies (Robinson 2007). The incremental approach to budgeting – whereby all organizations covered in the budget are given incremental increases in their budget from year to year – is often criticized for not taking into account whether the programs that are receiving funding are actually effective and deserve continued appropriations.

Fourth, if the PB system entails a change in the budget format from an input-based classification (e.g., personnel, supplies, subsidies, investments, etc.) to an outcome- or output-based one, it can increase flexibility in the use of budgetary resources (Andrews 2004; Hawkesworth and Klepsvik 2013; Robinson 2007). Input-based budgeting (especially if the line items are very detailed) can lead to a waste of resources when public officials spend down the foreseen line items even if priorities or funding needs for different activities have changed. If the appropriations are made for outcomes or outputs, the managers in the organization can make spending decisions with a view to what delivers the best results.

Finally, PB is claimed to increase allocative efficiency in the public sector – meaning that resources are directed to activities that attain the largest benefits (Pollitt 2001; Robinson 2007). Performance information allows public officials to make better informed decisions about funding levels for different activities and adjust resource allocations according to changes in government's priorities and societal needs.

## Challenges of Performance Budgeting

There are at least three sets of challenges that performance budgeting faces: (1) It is difficult to measure performance in the public sector; (2) it is difficult to use performance information for budgetary decisions; (3) budgeting is an inherently political process.

First, an important set of challenges faced by performance budgeting is related to the fact that it is often difficult to *measure* performance in the public sector in a meaningful way. In collecting performance information, public sector organizations can focus either on outputs, outcomes, or both. Collecting information about *outcomes* can provide valuable insights about the effects of governmental activities on society. However, a change in an outcome indicator may be influenced by a wide array of external factors that are beyond the control of a governmental organization (De Lancer Julnes 2006). For example, the crime rate is influenced by many things aside from the activities and performance of police departments (e.g., a sudden worsening of the economic environment). Thus, it may be difficult to ascertain what exactly the effects of different government programs have been. Pointing to causal linkages is particularly challenging in the case of government programs that take a long time to have an effect (e.g., in education, health care, economic development) (Hatry 2002).

Given the challenges involved in developing and using *outcome* measures as informational input for budgeting, public organizations may settle for *output* measures, which are easier (and also cheaper) to collect (Blöndal 2003). Excessive focus on output measures, however, may distract public managers from the actual mission of their organizations (Bohte and Meier 2000). If public officials know that their performance is evaluated according to narrowly defined output indicators, they may be motivated to dedicate most of their efforts to maximizing these indicators at the expense of other activities that have important public value but cannot be easily measured. Second, it can be very challenging to use performance information for budgetary decisions as it is difficult to establish what implications a change in outcome or output measures should have for funding levels (Caiden 1998; Schick 2007). If an organization has failed to achieve a performance goal, does that mean that its budget should be reduced or increased? There may be good arguments for both. On the one hand, the performance

measure may have deteriorated because of underfunding; thus, additional funding could help to achieve the goal in the future. On the other hand, one could argue that funding should be taken away from ineffective organizations and allocated to more effective ones. Indeed, performance indicators alone may not be sufficient for giving adequate guidance in such a situation. As Perrin (1998, p. 372) has put it, "Attempting to reduce a complex program or social intervention, such as initiatives in child welfare, economic development, or health promotion, to a small number of quantitative indicators can disguise and mislead rather than inform what is really happening." Furthermore, several governmental goals tend to be "eternal" (e.g., alleviating poverty, reducing crime, promoting economic development), and even if agencies fail to achieve their stated goals, reducing their appropriations would be an unrealistic sanction given the need for governments to address these problems (Caiden 1998). In addition, using performance information for decisions on budgetary appropriations is complicated because of the attribution problem. Given the complexity of many societal problems, it would be difficult to establish clear causal linkages between resources and outcomes (Schick 2007; Pollitt 2001). For example, if funding for school lunches is increased, it may be hard to evaluate how much the increased funding influenced the health indicators of schoolchildren, as there are many other factors that can play a role here. That, in turn, could make it arduous for the agency requesting additional funding to demonstrate ex ante how exactly additional funding would improve the performance indicators. Also, ex post, if the agency's target indicators were not achieved, it could be unfair to reduce their funding.

Third, as budgeting is inherently a *political process*, the decision-makers are likely to be motivated by many other factors – alongside or even at the expense of performance information – when allocating resources: the desire to be reelected, ideological considerations, electoral promises, symbolic arguments, societal values, and the need to ensure transparency and control (Joyce 2008; Schick 2007; Wildavsky 1978, 1992). Thus, even if the performance information provides a strong signal to elected officials that they should reduce or increase funding for an agency, they may be reluctant to do so because of the aforementioned considerations. Furthermore, in many countries a significant portion of the budget is made up of expenditures mandated by law (e.g., social security payments, family benefits, etc.). In the case of such expenditures, it would not be possible to reduce or increase funding according to performance information without changing existing law (Pitsvada and LoStracco 2002). Finally, the budget preparation is usually a time-constrained process in which the participants have to consider a lot of information (Hatry 2002; Schick 2007, 2014). Collecting, analyzing, and interpreting performance information are time consuming and costly (Andrews 2004; Caiden 1998). Thus, under intense time pressure and in the face of limited analytical capacities, officials may not be able to integrate performance information into their budgetary decision-making.

In light of these difficulties, it is not surprising that many empirical studies have observed that performance information is often *not* used in making budgetary decisions – even if systems for collecting PI are in place (e.g., Curristine 2005, 2007; Joyce 2008; Schick 2007, 2014). The nonuse of performance information for budgetary decisions is particularly pronounced in the case of politicians in the legislature, whereas it is used to some degree in the negotiations between finance ministries and line ministries. The most extensive use of PI tends to occur in the internal decision-making of agencies (Berry 2007; Curristine 2007; Hawkesworth and Klepsvik 2013; Schick 2014). The existing empirical literature also indicates that performance information is more likely to be used at the *local* than *central* government level (e.g., Melkers and Willoughby 2005).

While fiscal stress is often viewed as a driver behind the adoption of performance budgeting reforms, the empirical evidence shows that the use of performance information tends to fall during cutbacks (Raudla and Savi 2015; Schick 2014). In principle, performance budgeting could allow decision-makers to undertake more "rational" cutback decisions, e.g., by preserving

well-performing programs and trimming less effective ones (Hawkesworth and Klepsvik 2013). In reality, however, cutback decisions are driven by other considerations than performance, e.g., what is legally possible and what is politically feasible and less likely to meet strong opposition or social unrest (Schick 2014).

Another important finding of the existing studies is that different types of decision-makers in the public sector have varying informational needs when it comes to PI in the budget process (Curristine 2007; Hawkesworth and Klepsvik 2013). For example, politicians find formal performance reports focusing on snapshot indicators less useful than deeper, richer information that addresses the complexities and uncertainties of the public sector (Ter Bogt 2004). Generally speaking, the closer to the actual public service provision one moves, the more useful performance information is likely to become in resource allocation decisions (Pollitt 2001). For example, it may be rather difficult for a cabinet to decide whether education should get more funding than health care on the basis of PI. Similarly, a minister of education would find it challenging to use performance information for decisions on how to allocate resources between higher, secondary, and primary education. However, it would be feasible to use performance information in budgetary decision-making within particular schools or universities (Pollitt 2001). Different policy sectors are also likely to have varying informational needs. Using performance information might be more feasible in agencies that are involved in providing tangible services (e.g., road construction, issuing drivers' licenses and passports) than in agencies that deal with intangible services (e.g., coordination) or regulation (e.g., financial regulation or consumer protection) (Pollitt 2001; Ter Bogt 2004).

## The Problems of Adopting a Performance-Based Budget Classification

The challenges described in the previous section apply to all forms of performance budgeting. There are, however, a number of more specific problems (or even dangers) of switching from a traditional input-based budget classification to a performance-based one.

First, if, as a result of the format change, the budget consists of very general and abstract outcome targets and budgetary appropriations for achieving them, it may be difficult to assess whether the outcomes have been actually achieved and whether the use of resources has been appropriate. For example, after an outcome-based budget format was adopted in Australia, the ministries came up with highly aggregate outcome goals (e.g., the entire defense department had only three outcome measures). Dissatisfied with such a budget, the finance minister voiced the following concerns: "Some outcomes are so broad and general as to be virtually meaningless for budget accounting purposes leading taxpayers to only guess what billions of their dollars are being spent on... The Outcomes and Outputs Framework was intended to shift the focus of financial reporting from inputs... to outputs and outcomes, i.e., actual results. While this is worthy in theory, it has not worked. Basic information on inputs was lost in the changeover, and reporting of outcomes is seriously inadequate" (Mackay 2011, p. 23).

The reduction of the number of line items in the budget law may lead to a reduced role of the legislature in the budget process and hence to its decreased capacity to control whether the use of taxpayers' money has been purposeful. This, in turn, may undermine the transparency and democratic legitimacy of the budget process as a whole. The existing empirical studies have demonstrated that the adoption of performance-based budget documents has indeed undermined the parliament's role in the budget process, rendered the budget law less transparent for the members, and created difficulties in undertaking ex post controls (e.g., Sterck 2007).

Third, the use of a performance-based budget format gives rise to a situation where the breakdown of the budgetary expenditures varies significantly from year to year (as performance goals may change), making it difficult to compare expenditures over time (Webber 2004).

Finally, the use of a performance-based format may lead to reduced accountability of managers in the public sector. One of the core ideas of performance budgeting is that the managers would be made accountable for results instead of inputs. Given the challenges of establishing causal relationships between the activities of an organization and the societal outcomes (described above), it may, however, be difficult to hold officials accountable for results they cannot wholly control.

## The Potential Dangers of Linking Budget Appropriations to Performance Indicators

The critics of presentational performance budgeting have argued that if the public officials know that performance information does not actually influence budgetary appropriations, they have fewer incentives to focus on improving performance. In order to address this problem they suggest to link funding more closely to performance indicators. Establishing more direct linkages between performance and budgetary appropriations, however, can lead to negative consequences.

First, since achieving performance goals in the public sector usually does not depend entirely on the efforts of the agencies, the reduction of funding after the organization has failed to achieve a performance target can create a sense of unfairness and lead to reduced motivation (Mayne 2007; Pollitt 2001).

Second, close linkages between performance targets and financial incentives can encourage "gaming" by the agencies and their officials and, as a result, may lead to worse results than would have been achieved without the performance budgeting system (Bevan and Hood 2006; Hood 2006). Indeed, when the size of budgetary appropriations is clearly linked to performance indicators, agency officials may be motivated to focus only on reaching these indicators and neglect other aspects of their activities (Bohte and Meier 2000). Worse still, in order to maximize their performance indicators, the officials may undertake activities that are socially undesirable (de Lancer Julnes 2006; Mayne 2007). An infamous example of such behavior is the case of hospitals in the United Kingdom. After their funding was made dependent on very specific performance indicators like shorter waiting times, the hospitals started putting up tents in their yards where the emergency care patients had to wait, in order to achieve their target of reduced waiting time *in* the hospital (Bevan and Hood 2006).

Third, linking funding closely to results may lead to a deterioration in the quality of performance information collected by the agencies (Hood 2006; Perrin 1998; Smith 1999). If the officials know that performance indicators can be used for reducing their budgets, they might have incentives to present embellished or distorted information or to start defining performance indicators in a way that is advantageous to them (but does not necessarily reflect improved performance) (Perrin 1998).

Finally, close linkages between performance indicators and budgetary appropriations can lead to a situation where performance indicators are primarily used for accountability. This, in turn, may undermine the role of performance information in organizational learning. Indeed, several studies have argued that a performance measurement system that emphasizes *accountability* might in fact work against achieving better results and improved performance (e.g., Halachmi 2002; Hatry 2002). When performance information is primarily used for accountability, the main questions asked are: was the goal achieved, who is responsible for it, and what are the sanctions for not reaching the set goal? When performance information is predominantly used for improving results, the focus of the system is on discovery, learning from experience, innovation, and change.

Thus, in establishing a performance budgeting system, it is important to realize that there might be a trade-off between increasing accountability and improving performance. If the primarily goal of measuring performance is increased accountability, the officials would have incentives *not* to deviate from the set goals and plans, even if such deviations might be in the public interest.

Accountability-oriented performance budgeting systems may prevent public officials from reacting responsively and adjusting strategically to changing circumstances in the environment (Halachmi 2002).

## Conclusion

At first sight, it might be difficult to argue against performance budgeting since it is rhetorically convincing and "sounds really good" (Moynihan 2005). Who wouldn't want to improve performance in the public sector? Who wouldn't want the government to make more efficient use of taxpayers' money? Performance budgeting does indeed have several advantages. It can promote transparency, demonstrate what has been achieved with public resources, encourage officials to become more results oriented in their work, and enhance allocative efficiency. However, implementing performance budgeting often faces a number of challenges and even dangers. The potential problems caused by performance budgeting tend to be relatively small in cases where performance information is just added to the budget documents. They can, however, become more severe when the more extreme forms of the reform idea are implemented, especially when funding decisions become directly dependent on whether the organization has achieved a performance target or not. When budgetary allocations are directly linked to the achieved results, public organizations may start gaming the system, which could lead to perverse results. Given the nature of the public sector and complexity of the problems it has to address, it would be more advisable to use performance budgeting as an *analytical instrument* rather than a *decision rule* (Schick 2007). If used as an analytical instrument, performance budgeting can enrich the informational basis for making funding decisions. If used as a decision rule (like it is in the case of performance-based budget formats), performance budgeting can become too constraining and lead to unwanted results. Reformers of the budget process should also keep in mind that budgeting is inherently political. Thus, attempts to completely subject it to a technocratic vision of rationality are likely to be unsuccessful.

## Synonyms

Performance management; Performance measurement

## Definition

The concept of "Performance crisis" illustrates the paradox of the increased need present in the public serving organizations like public sector service providers and/or private nonprofits funded by the government to document their efforts for performance management and the enhanced public perception that performance indicators are not included in the decision-making processes.

## Introduction

This chapter focuses primarily on the concept of performance crisis with the focus on public serving organizations like public sector service providers and/or private nonprofits funded by the government. These organizations need to comply with specific, arguably stricter, requirements to measure their performance and be held accountable for their performance, because they do work with public money.

Improving the performance of public serving organizations represented the basis of the constant movement toward reforms in the public sector (van Dooren et al. 2010). Public management reform represents a constant feature of the change efforts undertaken by different government levels in almost all countries in the world in the last 40 years (Pollitt and Bouckaert 2011). Different reform waves attempted, on their turn, to adopt (and sometimes adapt) solutions from elsewhere or to develop their own way of addressing the (social) problems they were facing

(Schimmelfennig and Sedelmeier 2005). The literature advances different explanations for the variations in the expected results of the reforms. Olsen (2015) refers to the lack of proper theoretical grounding for the design of reforms. Van Thiel and Leeuw (2002), and Moynihan et al. (2012) address the perverse effects of measurements of results, whereas Meyer-Sahling and Yesilkagit (2011) advance several hypotheses concerning the effects of the administrative legacy to explain the difficulties of advancing reforms in developed versus developing countries. Deficiencies in terms of administrative capacity have been primarily discussed in relationship to the implementation problems that arose in Central and Eastern European countries (Hintea et al. 2004).

Performance management is dedicated to improve the efficiency and effectiveness of public and semipublic organizations providing services to the public and it is an essential component of strategic planning. In the case of local governments and nonprofit organizations, strategic planning represents a fitting tool to guide the organizations within the processes of reform (Hintea et al. 2015:31).

Accounting for the results in front of citizen as well as in front of the appropriate institutions is a specific condition for the functioning of public and nonprofit organizations in general and for local governments in particular. Increased citizen involvement and interest for the performance of public and nonprofit organizations leads to increased scrutiny and responsivity on behalf of the public organizations. Both public and semi-public organizations can be part of the problem when their internal organization structure is not suited to address challenges coming from the environment, but are nevertheless expected to provide at least a part of the solution. Public, semi-public, and nonprofit organizations are constantly subjected to the challenge of executing reforms (either as implementation of national policies, or subject to constant internal restructuring). These organizations are specifically exposed to turbulences coming from their environment, being subject to different challenges coming from the political sphere, from media, and from citizens (Rainey 2014).

Local context is also very important for the challenges faced by local level organizations in comparison to the ones faced at national level when carrying out reform efforts. Local context, (defined on the basis of socioeconomic characteristics, political configurations, local organization capacity) does play an important role for the success of the performance management and performance measurement effort, and in the level of institutional capacity allocated to the management of performance. The timing of reforms is important for the strategic planning effort as performance improvement tool. Pollitt and Bouckaert (2011:33) draw the attention that at the macro-level, the "spirit of the time" is an important element to take into account. The idea of "spirit of the time" encompasses elements such as ideas, concepts, and positions on what is legitimate in terms of public management reforms and of performance management.

The recent 40 years have registered three major paradigms of public sector reform, namely, (a) New Public Management (NPM); (b) Neo-Weberian State (NWS), and (c) New Public Governance (NPG). These three paradigms addressed different parts of the public sector value triangle: efficiency-effectiveness- legitimacy, and were predominant at different moments of time. New Public Management focused on efficiency and dominated during the 1989s and 1990s. Initially addressing issues concerning the improving of the performance of the public organizations and importing management techniques and methods from the private sector management, the NPM looked further into analyzing paradoxes and unexpected results associated with the public sector reforms (Hood and Peters 2004). Neo-Weberian State (Pollitt and Bouckaert 2011) proposed an alternative to the perceived mechanistic import of managerial techniques from the private sector. Developed at the beginning of the 2000s, this paradigm put forward a strengthening of the Weberian foundation of the professional public administration and attempted to redress the balance of values toward effectiveness and legitimacy. Finally, the New Public Governance paradigm proposed a reinterpretation of the role and function of the governmental organizations, and proposed an inclusion of a broader range of

societal partners who jointly address societal problems (Agranoff 2007; Osborne 2010; Pollitt and Bouckaert 2011), furthering in this way the importance of legitimacy through broadening societal support. This paradigm developed after the mid-2000s.

The high level of task complexity specific for public organizations, as well as their character of addressing topics and policy problems which the private sector does not have the incentive to address contribute, as well, to the difficulties in measuring and managing the performance of public, semipublic, and nonprofit organizations. It becomes increasingly difficult for these organizations to achieve levels of performance considered acceptable by the large public, given the constant reduction in resources and capacity allocated to performance management, and to the streamlining of the efforts within the organization. Generally speaking, the level of "slack" previously existent in public and semipublic organizations has been reduced under the slogan of "improving performance" and of "using the existent resources in the most efficient way possible," and, at the same time, making efficiency gains increasingly difficult to achieve. However, it should be noted that performance management and measurement is not specific to the reform waves of the last 40 years. There are arguments to support the thesis that performance management and measurement represent a constant dimension of the reforms in public administration in the last 100 years (van Dooren et al. 2010:42).

Whereas each of the reform waves expressed the aim to improve the performance in the delivery of the public service, they employed different underlying mechanisms to explain the performance attainment. The distinction proposed by Van Dooren et al. (2010:32) is very useful to understand the consequences of the concurrent application of the three mechanisms. The distinction differentiated between (a) performance, defined as accomplishment of public values including efficiency, effectiveness, openness, integrity, and participation; (b) performance measurement, defined as obtaining information about the performance of the organization; and (c) performance management, defined as using actively the information about performance during the decision-making process.

The concurrent application of these three mechanisms has led to overlaps in terms of mechanisms, indicators, and expected effects. This overlap strengthened the conceptual confusion. Subsequently, different critical points were formulated regarding performance of public organizations and a perception that the performance of public organization is in crisis. Disentangling these mechanisms and effects, developed and produced under different performance regimes, can lead to a strengthening of the analytical paradigm under which the organization performance is designed and implemented. Directions to conduct this analysis can be formulated at the institutional, policy, and organizational level.

## Institutional Level of Performance Analysis

At the *institutional level,* the discussion can be differentiated in terms of the institutional arrangements centered on the performance of international institutions, and the performance of international governance. The analyses of the latter were carried out primarily in the area of international crisis management, with different crisis situations as the setting for analysis. In international relations and international law the case of financial crisis has converged extensive analysis, with primary critique focused on the lack of coordination and visible results, with possible exception of the International Monetary Fund (IMF) (Zaring 2010). International coordination in case of violent conflict situations has also been extensive. Several examples based on the European context include the analyses of the lack of coordination of EU countries in the case of Yugoslavian conflict, the coordination in case of the Crimean conflict, as well as the lack of coordination of European Union (EU) countries when coordinating the response to the migration crisis of 2015 or of the treatments of the refugees in Greece and Italy; examples can also be identified in other parts of the world. The performance of international institutions in coordinating

efforts on health care crisis situations is further subject to analysis.

The relationship between international response by World Health Organization (WHO) and different national responses in cases such as SARS, H1N1, Ebola, and the COVID-19 crisis situation primarily underlines the consequences of the international lack of coordination in terms of institutional international arrangements and the relatively limited role that the WHO can play in formulating recommendations. International health crisis situations underline even further the complexity of the concept of performance crisis because the dimensions of assessing the performance are blurred and overlap in the different political and scientific discourses. These dimensions include (a) the international communication of scientific information and the different assumptions in the different scientific domains, for instance, in medical and in social sciences; (b) the explicit justification of the assumptions built in the different scientific models used to estimate the evolution of the disease; and (c) the different mechanisms and procedures through which the scientific knowledge is translated in policy.

Particularly this last dimension becomes very relevant in a pandemic crisis where relatively little scientific research is available on the medical aspects of the situation and the mechanisms and processes through which the available international knowledge is translated into policy advice at the country level in fairly different ways. This translation (a) usually depends on the specific policy advisory arrangements existent at the country level, (b) takes into account the specific policy and health care organization within the country, and (c) is influenced by the policy makers tolerance for risk and uncertainty, as well as the country's cultural and institutional tolerance for risk and uncertainty.

## Policy Level of Performance Analysis

At the *policy* level, the performance discussion can be differentiated in terms of the policy formulation and policy execution. In terms of the policy formulation, the primary phases of the policy cycle (agenda setting, problem definition, and alternative definition) set out the stage for the policy performance. From a rational policy perspective, a "job well done" in terms of policy formulation creates the conditions for the "job well done" in terms of policy execution, provided that the decision stage is also executed properly. The rational perspective presumes, however, that there is a generally accepted definition of the policy problem treated at a particular moment, with clearly defined goals to be achieved as well as generally accepted criteria set out for the assessment. The core value at the basis of this approach of policy is usually efficiency operationalized in the maximization of utility obtained from available resources. This makes, at first sight, the assessment of performance rather straightforward. However, a policy can be analyzed also from the political perspective, which relies on fairly different assumptions. In this perspective, the policy problem is broadly formulated; the policy goals are per definition vague, contradictory, and confusing; and the criteria to assess the policy performance are contested by multiple actors. The need to ensure the support of all major political actors leads to such a broad definition of the policy problem, goals, and assessment criteria, which subsequently make performance assessment difficult to execute. The coalitions of political actors are also usually constantly moving, adding to the turbulence of the policy environment and to the difficulty to control the performance regime.

These different policy paradigms help explain why in crisis situations, assessing policy performance becomes even more difficult than in usual times. The rapid evolution of a situation usually does lead to different assessments of the problem definition, of the goals, and of the criteria to assess policy performance. The information available to the policy makers also changes fast, and the way the information and indicators are constructed and reported can also lead to different assessments. In the COVID-19 example, the cross-country differences in terms of health care policy arrangements – such as whether health care is organized around hospitals or around general practitioners,

availability of reserve emergency stock materials, availability of personnel, categories, and availability of healthcare insurance – do lead to different policy responses and, subsequently, to different results.

## Organization Level of Performance Analysis

At the *organization* level, the performance discussion can be differentiated in terms of management and execution (front line). The examination of performance management systems usually centers on (a) the systematic organization of the activities and (b) the communication of the expected levels of the operation to the employees. Subsequently, the activities translate in standard operating procedures (SOPs) and specific tasks that can be performed with different levels of administrative discretion. The task execution is followed by the appropriate registration of the activities performed and monitoring if the expected levels of operation are achieved. The result of this set of activities is defined in terms of outputs and of outcomes, which, on longer terms, help define the impact the organization creates. However, the organization performs its activities in a specific context defined by a legal and policy framework. The organizations (public, semipublic, and nonprofit alike) interact with their environment, and the activities performed by their management do influence the results of these interactions. The goals they aim to address vary as well, and, for the (semi) public organizations in specific, these goals are connected to creating public value such as effectiveness, equity, equality, legality, and efficiency. The forms and degrees of market instruments that have been implemented in terms of organizing and monitoring performance throughout the reforms in the recent 40 years have made a significant impact in the way the performance monitoring has been implemented at organization level.

Different instruments of performance monitoring have been put in place at organization level – such as dashboards, scorecards, tracing systems – which provide the managers with insights at the level of goal achievement. At the execution level, different ways of (self) monitoring, use of technology for self-organization and for improvement of organization processes, and also softer ways of personnel self-improvement, are set to use in order to measure the level at which the tasks are executed. Subsequently, a few caveats refer to the way in which the indicators are being defined and compiled in the performance monitoring. Several known limits in formulating indicators and monitoring (de Bruijn 2007) include (a) focus on easily measurable indicators, which may provide a skewed view on the breadth of activities required to achieve the organization's goals; (b) the need to rotate and periodically revise the indicators, and (c) reward only the achieving of some indicators. The last two caveats address specifically the need to prevent the creation of blind spots because a particular set of activity is overlooked or only a particular set of indicators are being used, usually formulated by the expression "what gets measured gets done".

The performance at the organization level becomes even more important in a crisis situation, particularly with regard to (a) the relationship between centralization and coordination (Moorkamp et al. 2020) and (b) the way data about the activities executed is being collected, compiled, verified, and communicated. The centralization and coordination of tasks within and across organizations involved in crisis management requires a higher level of flexibility and adaptation than in "business as usual" times. When the personnel at the execution level needs to dedicate extensive time to the collection and compilation of data, this may come at the cost of performing the core task, and the latter has a higher priority. Subsequently, when there is limited verification of the registration protocol, the chance for errors and delays in registration increases, which, cumulated, may depict a flawed image of the situation and lead to mistakes in the decision-making process. Of particular importance is the understanding of the different ways in which the specific indicators, such as in the COVID19 example, are registered and collected at the country level, and are used for the public communication within the crisis. If

insufficient attention is allocated to understand the construction of indicators and their limits, these indicators limit the international comparisons, as well as the assessment of the problem description across countries. Some examples are: reporting absolute versus cumulative numbers versus percentages, or not paying attention to the units of the graphs, or to the time delays of registration between countries. International organizations such as WHO can play a role in transforming these indicators, but that usually requires capacity which otherwise in crisis situations may not be available.

## Conclusion

This chapter focused on the concept of performance crisis with the focus on public serving organizations like public sector service providers and/or private nonprofits funded by the government. The public sector reforms of the last 40 years were designed and carried out with the explicit goal of improving the performance of organizations in the public, semipublic, and nonprofit sector, particularly due to the increased citizen demands both for service quality as well as for accountability and transparency. The relationships between the public values created by the public, semipublic, and nonprofit organizations arguably changed throughout the time, with a prominent position allocated to the value of efficiency. The unintended consequences of focusing on efficiency increased over time and the need to recalibrate the balance became increasingly manifest.

The discussion on the performance crisis used the example of the COVID19 pandemic to illustrate the complexity of the concept and to argue for the need to analyze this concept on three levels: institutional level, policy level, and organization level. These dimensions have been operationalized in terms of international institutional arrangements, country-level policy structures, and execution at organization level. These levels are interrelated and the argument above proposes an integrated approach in order to conduct a coherent performance assessment. The performance crisis can be defined as a lack of coherence at the analytical level among these three levels.

This discussion needs to take into account also the characteristics of the political regimes on the problem definition, the choice of the policy instrument – or of the policy mix – and the level of control when assessing performance in crisis management. A preliminary difference in terms of democratic versus authoritarian or ideological dimensions of the political decision makers provides a first set of insights to establish the criteria used for assessing the performance of a particular approach. Finally, the socially accepted level of social control and the use of exceptional measures, such as declaring the state of crisis situation, add to the complexity of assessing performance. To what extent is there indeed a performance crisis? The example of the COVID19 crisis suggests that there is an increasingly acute understanding at all levels of the basic elements required for performance assessment and that the integration of the levels of analysis and of cross-level understanding of the conditions for performance measurement is needed more than ever.

## Synonyms

Accountability; New public management; Organizational performance; Performance indicators; Performance management; Performance reporting systems

## Definition

Performance evaluation and reporting should be studied under the complex and multidimensional concept of performance. *Performance evaluation* is an important element in the management control of an organization through the incorporation of key performance indicators in performance measurement systems. After the new public management (NPM) era, greater attention has been put on the performance evaluation process as a way to lead to organizational improvements. There may be an interrelationship between the control focus of an organization and the aspects which are emphasized in the evaluation of performance (an internal perspective). *Performance reporting* is linked to the concept of accountability and to the need to improve the reputation of an entity (an external perspective). This linkage between performance reporting and accountability is based on the notion that reporting about performance contributes to monitor and evaluate the actions of public sector managers and politicians, helps to plan and to prepare the budget, to learn and improve, and to compare actual performance and expected results. Both concepts are interconnected and strongly associated with the need to measure, to report, and to manage public sector organizations' performance.

## Introduction

The new public management (NPM) was a global reform movement aiming the introduction of business-like tools in the public governance (Hood 1995), assuming that public sector organizations can be managed and evaluated in the same way as private organizations, namely through demands for accountability, transparency, and efficiency, and responsiveness. Central to these reforms is the need to monitor and evaluate performance, on the basis of results-oriented performance information (Boyne and Law 2005), and to make managers more accountable for their actions and decisions about the use of public resources (Budding 2004; Moynihan and Pandey 2010). A multidimensional system incorporating

quantitative and qualitative indicators that measure, evaluate, and report the level of activity, inputs, outputs, and outcomes of the public governance is an important device in the implementation of these reforms (Jansen 2008; Hammerschmid et al. 2013). Based on Behn's (2003) list of eight different managerial uses of performance information, Hammerschmid et al. (2013: 1) characterize these uses into two groups: (1) internal purposes, "when performance information is used for monitoring, evaluate, control and improve operations," and (2) "external purposes, associated with showcase performance, give account, compare and benchmark." Although internal and external uses are related, this chapter one assumes that performance evaluation has a purely internal function and performance reporting is more externally oriented.

Several scholars have been motivated by the philosophy of the NPM to study and research about public sector performance evaluation and reporting in the last 20 years. The works of Bogt (2001, 2003), Behn (2003), Budding (2004), Pollitt (2006), Jansen (2008), and van Helden et al. (2012) are just a few examples. Performance evaluation and reporting is seen as an important part of the accountability process and became central in the implementation of NPM reforms. For example, the introduction of performance-based contracts, target-setting and performance reporting are dimensions of NPM (Hood 1995; Jansen 2008). However, the use of performance information in the public sector, either for internal or external purposes, is quite limited (Bogt 2001, 2003; Budding 2004; Politt 2006; Jansen 2008; Hammerschmid et al. 2013) because "politicians do not often behave in the rationalist manner implied in the NPM model" (Lapsley and Pallott 2000: 227).

Government accounting literature identifies at least two different lines to understand the role of accounting in NPM reforms: a rationalist perspective, where accounting is seeing at the center of the reform (economics theory), and a symbolic perspective (legitimacy theory), where accounting practices only imply symbolic changes with no effects on internal operations (Lapsley and Pallott 2000). Given this twofold perspective, performance information is not only used as a measurement tool but also as a communication tool (Hammerschmid et al. 2013). Overall, performance evaluation and reporting in government organizations are considered complicated tasks given the multiplicity of actions and objectives to which they are subject, adding to the existing political pressures.

This entry intends to approach the themes related to public sector entities' performance particularly concerning its evaluation and its report, highlighting the main challenges and difficulties in this process of change after NPM.

## Performance Evaluation in the Public Sector: An Internal Perspective

Performance evaluation is usually not only or primarily based on concrete and factual aspects of the way how managers operate and "objective" information about this, but also on more general impressions and subjective opinions (Bogt 2001, 2003). Bogt (2003) explains that performance evaluation in government organizations, as evaluating the success of NPM reforms, is complicated. Several factors play a part here, such as different opinions on what to measure and how to do it, frequent changes on performance measures, imperfections in performance measurement, multiplicity of goals (perhaps sometimes concealed), a politician's feeling that there will often be different and altering perspectives on what constitutes "success," and problems in establishing causation (Bogt 2003; Budding 2004).

An important study about performance evaluation was developed by Bogt (2001), trying to determine whether politicians attach value to quantitative output information and whether they use this sort of information to control their organization and to evaluate managers' performances (internal use). Based on the experience of Dutch municipalities, Bogt (2003) found that politicians expect managers to have feelings for the political wishes and needs, a cooperative attitude and an ability to encourage departments to work quickly and in a flexible way and to show initiative. This

shows a hardly use by politicians, of quantitative output information available in budgets, management reports, and annual accounts.

Hopwood (cited by Bogt 2001) distinguishes three different styles of performance evaluation, which are based on research in the profit sector: the budget-constrained, the profit-conscious, and the nonaccounting style (implicit style for the public sector). Adapting these styles to the public sector, Bogt (2001, 2003) presents four styles of performance evaluation methods: (1) the implicit style, (2) the operations-conscious style, (3) the output-constrained style, and (4) the outcome-conscious style (see details in Fig. 1). A manager's performance evaluation style is an important aspect of his management style and the features of a specific style depend upon both the extent and the way performance and budget information are used (Bogt 2001).

As Bogt (2001 and 2003) concluded, for the purpose of performance evaluation, professional managers are more focused on activities and information processes rather than on their outputs or outcomes measures. More recently, in three Portuguese large municipalities, Gomes et al. (2015) confirm these findings about the greater orientation by politicians to the implicit style and the operations-conscious style on the managers' performance evaluation.

On a different perspective, Budding (2004) discusses the relationship between accountability and performance, deepening and extending the understanding of the behavioral and organizational effects of holding managers accountable in governmental organizations. The author starts his study by stating that "the identification and definition of the products of governmental organizations is a relatively subjective exercise, and therefore, output-indicators are also relatively subjective and easy to manipulate" (Budding 2004: 287). The author emphasizes this subjectivity highlighting that "the decision making in these organizations is a consequence of the multiple, conflicting political pressures, which result in relatively vague compromises that are also very unstable" (Budding 2004: 287). Due to these circumstances, identifying the relevant performance indicators and their targets is complicated for governmental organizations. Thus, holding managers accountable when targets are not clear could lead to negative effects.

Politt (2006: 38) argues that "evaluation is [. . .] important to any democratic society. It benefits those who make decisions about policy, and it benefits the citizens who have to live with those decisions, once made." Examining the use of performance information by ministers, parliamentarians and citizens, the "end users" of performance information, the author concludes that little research has been done on whether and how elected representatives use the performance information, which is contained in evaluation reports,

**The implicit style:** quantitative and financial output play a minor part; there is no formal evaluation; the evaluation is based on changeable, subjective and qualitative elements rather than objectives; performance may be discussed when politicians are unsatisfied; little attention paid to accounting information on the actual performance; criteria of evaluation may vary across the time.
**The operations-conscious style:** manager acts as a good facilitator and intends to ensure that his organization is functioning well and is performing activities which will enable to a boss/chairman functioning well too, both in the short and in the long term; quantitative outputs play some part in this method of evaluation but are not the main focus; lot of attention paid to activities and processes of the Manager and of the organization.
**In the output-constrained style:** outputs are the products (goods and services); manager evaluated on quantitative budgets, especially on whether he/she has met the targets defined in short term; quantitative outputs are not only financial but also refer to quantities or numbers; budget can also refer quality aspects, express as a percentage; use of multidimensional quantitative outputs data: amounts of money, cost per unit, quantities and quality.
**In the outcome-conscious style**: outcomes are effects produced by outputs; outcomes are linked to politicians goals; managers evaluated on their contribution to the outcomes; accounting data outputs, such as budgets data, cost per unit and quality aspects, have an important role in the evaluation; attention focused on to what extent a positive contribution helps to effect maximization and to the long-term performance of the organization; attention paid by politicians to qualitative information: on external development and subjective factors in addition to quantitative output information.

**Performance Evaluation and Reporting, Fig. 1** Bogt's performance evaluation styles (Source: Bogt (2003))

performance audits, quality assessments, and inspections. It also alerts that if politicians and citizens seldom use performance information, then information cannot perform its supposed function in fostering transparency and trust in public programs and services. Thus, performance evaluation, performance measurement, and performance audit remain conversations between experts, technocrats, and managers, and not a significant feature of democratic governance (Pollitt 2006).

To summarize, the use of more sophisticated performance information to evaluate and monitor performance is not (yet) well developed among public sector organizations, as it was expected since the NPM reforms, mainly based on internal and managerial factors (Lapsley and Pallot 2000). Different aspects of the internal management structure, managerial styles, and the particularities of the political-administrative system justify differences on different contexts.

## Performance Reporting in the Public Sector: An External Perspective

Performance reporting in the public sector is associated with improvements of accountability in public sector organizations as well as their reputation and legitimacy. These accountability and reputation concepts of public sector organizations may be linked to the need for transparency, effectiveness, and efficiency brought about by NPM reforms, such as the harmonization of public sector accounting through IPSAS (International Public Sector Accounting Standards). Creso et al. (2013) explore the policy's pressures and responses of the research councils for the improvement of accountability, performance assessment, and evaluation. They argue that the "performance reporting are central to increased monitoring and evaluating, as they help to report, plan and budget; manage and evaluate; learn and improve; and compare performance and results" (Creso et al. 2013: 113). Their work concluded that performance metrics and increased emphasis on outcomes provide information necessary for organizational governance and address external pressures for transparency and accountability. Demands for accountability, transparency, efficiency, and responsiveness have encouraged the widespread and systematic monitoring and evaluating of public sector activities.

Lacey et al. (2012) study the interorganizational dependence and public sector performance reporting in the Australian federal police. They identify the importance of the independence between agencies for the performance reporting; independence refers to information represented in the performance reporting being derived from that the agency itself possesses and publishes. In addition to the issue of reporting and independence, there is also an issue of framing, legitimacy, and reputation (Lacey et al. 2012; Hammerschmid et al. 2013). Lacey et al. (2012) have concluded that within the public-sector context, practices of performance reporting have expanded during the last decade. Still, they need to pay more attention to the problems and issues of performance measurement across interorganizational networks, particularly where the performance of one agency within the network is heavily dependent on the performance of other agencies in the same network. These interdependencies are crucial to understand and compare performance.

Brusca and Montesinos (2016) have done an international comparison from an institutional and normative perspective comparing the frameworks of performance reporting in local governments. They argue that "a performance measurement system is a tool for producing information to quantify the efficiency and effectiveness of actions, and it can be used both to obtain information for decision making purposes (internal use) and to disseminate information to stakeholders on local government performance for accountability purposes" (external use) (Brusca and Montesinos 2016: 507). They additionally explain that many jurisdictions have begun to implement performance reporting systems as a step while adopting NPM reforms. Consequently, the development of performance reporting systems has been influenced by different contexts and by the successful introduction of NPM. Table 1 presents a summary of the main developments of performance reporting systems among different countries.

**Performance Evaluation and Reporting, Table 1** Comparison of the performance reporting systems in different countries

| Country | Development of performance reporting systems |
|---|---|
| ***Belgium, Australia, Canada, and the United States*** | Regions, states, and provinces have made the main efforts for obligatory reporting<br>Performance reporting is directed to stakeholders with an accountability vision, including the citizens' perspective<br>Professional associations play an important role in the United States, but not in Australia and Canada. In the Flanders region of Belgium, indicators have been included by the regional government<br>The context and level of NPM reforms is only superficial, and performance reporting systems cannot be said to have an important impact |
| ***Nordic (European) countries, United Kingdom, and Netherlands*** | Highly developed centralized performance reporting systems with the central government as the main actor, to control local governments and especially stimulate them in performance measurement and efficiency improvements<br>The Nordic countries have a relatively strong need to legitimate the public use of resources, thus the stakeholder model takes precedence over the shareholder model, and organizational stakeholders have more of a say than shareholders or top managers in the adoption, implementation, and use of performance measurement |
| ***France, Italy, Portugal, and Spain*** | Central governments have enacted laws emphasizing the importance of and need for performance reporting, but have not made much effort in practice, so reporting systems are still at an initial stage<br>Italy, Portugal, and Spain are all facing major economic and financial problems, and thus have an urgent need to measure efficiency and effectiveness<br>Benchmarking is not usual in these countries. Moreover, centralist administration is favored, and the central governments exercise control over local governments<br>Countries have enacted laws in response to a demand for transparency in the use of public resources, accountability, and improved quality of services, but performance information is scant, despite regulations requiring the inclusion of performance indicators in the financial report to improve accountability and transparency<br>The administrative cultures do not favor the publication and use of performance indicators, the tools for performance measurement are undeveloped and public management reforms are not holistic, so that only isolated measures have been introduced, and the law is the instrument for reform |

Source: Adapted from Brusca and Montesinos (2016: 521–522)

Veledar et al. (2014) underline that the practice of reporting performance information is very diverse across different jurisdictions, because in some jurisdictions public sector entities are required by law to report performance information annually, while in others the reporting of service performance information is voluntary and depends on the entities' will to enhance accountability and inform decision makers. In a context where changes are introduced and compulsory by law, public sector accounting changes would be essentially symbolic, motivated by the need to obtain legitimacy from external stakeholders. The institutional theory based on the coercive and normative isomorphism can help to understand differences on the level of implementation of performance reporting systems.

Measurement and reporting of public sector performance is an integral part of the accountability process in public sector entities, due to its capacity to facilitate achievement of the objectives of an organization and the communication

of relevant information to stakeholders. Performance information has therefore been recognized as playing a key role in public sector governance.

At this point, one can realize that performance reporting in public sector is essentially about the external demands for accountability. Reporting the performance is, however, a difficult task. Nevertheless, as Brusca and Montesinos (2016) explain, the financial information provided in the accounting and budgetary statements of many public entities is insufficient to achieve public sector accounting objectives and needs to be supplemented with performance information. Performance is measured and reported by means of performance indicators that account for the economy, efficiency, and effectiveness of public resources.

In the study of the performance reporting, it is important to refer the work developed by the IPSASB (*International Public Sector Accounting Standards Board*) on the measurement and reporting of public sector public performance. In particular, it is important to refer the publication of a recommended practice guideline (RPG 3), in March 2015, for reporting service performance information. The RPG is not authoritative like IPSAS and does not address the preparation of a financial statement; it aims to provide guidance and good practice on reporting service performance information in general purpose financial reports (GPFRs). In this way, compliance with this RPG is not required for an entity to assert that its financial statements comply with IPSAS.

For the IPSASB, an entity can present other types of information if this information is useful in meeting the objectives of financial reporting and meets the qualitative characteristics of financial reporting (relevance, faithful representation, understandability, timeliness, comparability, and verifiability). In RPG 3, there are multiple factors that the IPSASB considers relevant for the performance reporting, such as reporting boundary, period of reporting, selection of service performance information, location of service performance information, and organization of service performance information. Furthermore, RPG 3 addresses principles for reporting the service performance information that are important to understand the purposes of performance reporting (see Fig. 2).

Within the context of RPG 3, the IPSASB acknowledged that there are different approaches to reporting service performance information, including those more focused on outputs and those focusing on outcomes. In any case, the information reported explains how the entity is doing in terms of achieving the objectives.

P

1 - An entity should present service performance information that is useful to users for accountability and decision making purposes;
2 - When used in combination with the information in an entity's financial statements, service performance information should enable users to assess the entity's finances in the context of its achievement of service performance objectives and vice versa;
3 - The service performance information presented should take account of the entity's specific circumstances, such as: the services that the entity provides; the nature of the entity; and the regulatory environment in which the entity operates;
4 - The presentation of service performance information should achieve the qualitative characteristics of financial reporting, while applying the pervasive constraints on information in GPFRs;
5 - Aggregation or disaggregation of service performance information should be at a level that conveys a meaningful understanding of the entity's service performance achievements. Information reported should be sufficiently detailed for users to hold the entity accountable for its service performance, particularly its performance with respect to its service performance objectives;
6 - Comparability to other entities can be difficult to achieve in the context of service performance information, since diverse services are provided. Inter-entity comparability may need to be traded off against relevance,so that service performance objectives and their related performance indicators are chosen to be relevant to the service performance situation of the entity.

**Performance Evaluation and Reporting, Fig. 2** Principles for reporting service performance information. (Source: IPSASB, RPG 3 (2013: §32–37))

Concerning the disclosure of performance information, RPG 3 (2013: §38–39) establishes that, for each relevant service should be reported information about: (a) service performance objectives, (b) performance indicators that show the entity's achievements with respect to its service performance objectives, and (c) information on the cost of services. For performance indicators and service costs, the entities should yet display: (a) planned and actual information for the reporting period, and (b) actual information for the previous reporting period. It is also interesting to note that performance information reports should also include cross-references to the financial statements where appropriate, contributing to a more GPFRs.

To organize service performance information, RPG 3 suggests the elaboration of the "statement of service performance" which involves organizing information in to a tabular or statement form (RPG 3 2013: §78). This statement will support understandability and comparability of performance indicators, which are the basis for the success of performance evaluation and reporting.

Summing up, the normative and coercive isomorphism seems to be very influential on the implementation of performance reporting systems, being determined by the approval of compulsory law and the need to obtain legitimacy from external stakeholders.

## Performance Evaluation and Reporting in the Portuguese Context

Portugal is a centralized unitary state with central and local or municipal governments; it is considered a Napoleonic country with a Weberian legal and administrative influence. The country was under pressure to modernize its public administrative apparatus and reverse the tendency to centralize and nationalize public goods and service provision and delivery. In the last two decades, the successive Portuguese governments have implemented several administrative reforms, following NPM trends and therefore aiming "to introduce a new managerial rationality in public services, replacing the traditional approach to public management by the introduction of new managerial techniques" (Araújo and Branco 2009: 557) adopted from the private sector management.

The Portuguese government has been carrying out accrual-based accounting reforms since the approval of the public sector accounting basis law (Law no. 8/1990). However, the landmark of this reform was the publication of the Official Plan for Public Sector Accounting for the central government level (agencies and autonomous bodies), from 1997, followed by the publication of the Official Plan for Local Government Accounting in 1999. Afterwards, several Official Plans have been approved for the education sector, health, and social security. Since the 1990s decade reforms, the Portuguese government accounting framework "uses double entry combining cash-based budgetary accounting with accrual-based financial and cost accountings, providing information for both accountability and decision-making" (Jorge et al. 2008: 239). The introduction of the accrual basis accounting regime, the accounting standardization, the integration of budgetary, accrual and management accounting, and the need to facilitate data collection for the national accounts (government financial statistics) represented the main objectives of these public sector accounting systems.

Complementary to the budgeting and financial mechanisms, other planning and control initiatives became compulsory during the 1990s decade, such as the activity plan and the activity report (Decree-Law no. 183/96, September 27). These two management tools introduced the obligation for public sector entities to plan their activities to be carried out in the following year as well as the needed resources (activity plan) and to report the actions and activities accomplished in the last year (activity report). More recently, under the NPM agenda, the debate on methods to evaluate and control (individual and organizational) performance has therefore become more relevant in public administration, in politics, as well as in civil society (Rodrigues 2009). As a result of this debate, an Integrated Framework of Performance Evaluation in Public Administration (SIADAP) was introduced in the Portuguese public sector in

2004 by Ministers Council Resolution no. 53 and implemented in 2007 by Law no. 66-B/2007. This is a management by objectives model articulated with the management cycle, aiming to strengthen a culture of assessment and accountability in the public sector and to monitor the services performance in complying with the organizational mission. Table 2 presents the chronological evolution of the performance evaluation initiatives in the Portuguese public sector. As said by Rodrigues (2009: 9) about the new performance evaluation system "it introduced the paradigm of management by objectives in public administration" in this country.

Although the actual version of the SIADAP sets two evaluation levels – the individual and the organizational level, the former has been regulated and put into practice in first place (by the First version of the SIADAP). The most recent version of the SIADAP introduced a top-down approach because it enforced the involvement of the whole hierarchical structure of organizations. In this managerial context, top managers would be engaged in the goal setting process (both strategic and operational) and responsible for achievements. A deeper involvement of top managers in performance management processes took place in 2005 with the approval of the mission statement that represents a real management contract between the political leader and the top manager of each public sector organization. This initiative marked the beginning of top managers' formal evaluation process. Top managers' performance is determined by the performance obtained by the organization as a whole. The aim is leading organizations to engage in "real strategic thinking processes" (Rodrigues 2009). In this context, the Balanced Scorecard model and other performance measurement systems have been applied in some public sector organizations (Gomes et al. 2008; Gomes and Mendes 2013) to help managers in the goal setting process, as well as to identify performance indicators and the associated targets.

The articulation of SIADAP with the management cycle implies that it must include certain building blocks (article 8° of the Law 66-B/2007), as presented in Fig. 3.

This cycle relies on a management control framework. The monitoring and review of the objectives could enable to get feedback on what has already been accomplished and to introduce improvements throughout the whole system. In addition, performance reports could inform about performance, both in qualitative and quantitative terms, and to define and allocate rewards or sanctions, depending upon the situation. This report explains the achieved levels of effectiveness, efficiency, and quality.

Under the Law 66-B/2007 (article 28°), the Portuguese government created the Portuguese services evaluation council (CCA) with the following objectives: (1) assure the coordination and promote the cooperation between the various services with competences regarding planning, strategy, and evaluation, and promote the exchanges of experiences and disclosure of the good practices in the fields of evaluation. The year of 2008 was the pilot year in the first evaluation of public services based on SIADAP. Table 3 shows the matrix of the excellence degree attributed to public services by the Portuguese services evaluation council, based on 11 criteria, the first six criteria measuring the results of the service (outputs and cost-effectiveness). These criteria are the basis for

**Performance Evaluation and Reporting, Table 2** Evolution of performance evaluation initiatives in the Portuguese public sector

| Period | System | Scope | Criteria |
|---|---|---|---|
| 2004–2007 | SIADAP (First version) | Intermediate managers<br>Employees | Objectives<br>Competencies<br>Personal attitude |
| 2008 | SIADAP (Second version) | Organizations<br>Top managers<br>Intermediate managers<br>Employees | Objectives<br>Competencies |

Source: Adapted from Rodrigues (2009: 3)

SIADAP is a management by objectives model that should incorporates the following elements integrated in the management cycle as a whole:

i. Setting of service goals to the following year, taking into account their mission, attributions, multi-annual strategic goals superiorly determined, engagements assumed in the mission statement by the top manager, results of performance assessment, and budget availability;
ii. Approval of the budget, maintenance or change in the establishment plan of respective staff, under the terms of the applicable legislation;
iii. Elaboration and approval of the action plan of the service for the following year, including the objectives, activities and performance indicators of both the service and of each organizational unit;
iv. Monitoring and possible revision of service objectives and of each organizational unit, according to non-predictable contingencies at the political or administrative level;
v. Elaboration of the activity report, with qualitative and quantitative demonstration of the results attained, also including the social report and self-assessment report provided according to the present law.

**Performance Evaluation and Reporting, Fig. 3** The management cycle and SIADAP – an integrated perspective. (Source: SIADAP – Law 66-B/2007, article 8°)

managers and directors responsible by the planning, strategy, and evaluation areas of each ministry, to evaluate individually the performance of each service under its responsibility; the points obtained according to these criteria may or may not correspond to the self-evaluation obtained by SIADAP. To be distinguished with excellent performance mention, services and agencies should overcome most of the criteria defined in this matrix. These criteria represent a strong incentive to adopt new practices of control and management accounting on public services and public bodies voluntarily (motivated by management needs).

More recently, after a period of fiscal crisis and the strong external dependence from lenders requirements (Troika and IMF), Portugal embarks in an international harmonization process toward IPSASs adoption, after the adoption of IFRSs in the business sector (implemented since 2010). After a work of more than of 3 years to adapt the existent official plans of accounting to IPSASs, the government approved the System of Accounting Standards for Public Administrations – SNC-AP – by the Decree-law n° 192/2015, embracing a conceptual framework, 27 accounting standards (25 IPSAS-based addressing financial accounting and reporting, one for budgetary accounting and reporting and one concerning management accounting) and a multidimensional chart of accounts. This new IPSAS-based model will be implemented since January 2018 to all sectors of the Public Administration, including local government. The great impact on the performance evaluation and reporting can be synthetized on the following elements: (1) an accrual-based accounting system; (2) the production of a general purpose financial report including financial and nonfinancial information, forecasting information, and consolidated information from the State as a whole; and (3) the obligation to implement a management accounting system allowing to evaluate results and the accomplishment of objectives in terms of services delivered to citizens.

In addition, the Budget Framework Law (LEO) approved by the law n° 151/2015 introduces the adoption of programs budgets by all the central administration and the social security since 2019, accompanied by the development of a performance information system. It adds the need to disclosure online a general information about programs by subsectors, the objectives of the budgets policy, the budgets data, and the accounts of the state as a whole. In summary, being Portugal a European-continental country with a great influence of a civil law system, all the administrative and management reforms become compulsory by law. This is also true for the preparation and presentation of performance information, namely

**Performance Evaluation and Reporting, Table 3** Matrix of criteria of the services' degree of excellence

| | Criteria of Evaluation | Short description |
|---|---|---|
| Results of services | 1. Productivity | Comparison of the performance achieved with the human resources used (deviation between planned and accomplished) |
| | 2. Cost-effectiveness analysis | Comparison of the performance achieved with the financial resources used (deviation between planned and accomplished) |
| | 3. Results obtained by the service compared to previous years | Evolution of the results compared to previous years, based on the performance evaluation framework (comparison in time) |
| | 4. Results obtained in comparison with national or international standards, considering efficiency improvements | Excellence of the results obtained when compared with other standards, whether national or international, requiring benchmarking (comparison in space) |
| | 5. Overall improvement of evaluation parameters (effectiveness, efficiency, and quality) | Analysis of the exceedance of the evaluation parameters, compared to previous years, based on the performance, considering the weight assigned to each one |
| | 6. Analysis of deviations | Determination of the deviations between the degree of achievement and what was planned |
| | 7. Impact on society | Evaluation of the contribution of the service to the pursuit of public policies and degree of noncompliance (if applicable) |
| | 8. Users' satisfaction | Evaluation of the type of measurement instrument used, the complaint handling policy, as well as the degree of users' satisfaction |
| | 9. Employees' satisfaction | Evaluation of the type of measurement instrument used, as well as the degree of employees' satisfaction |
| | 10. Processes and system of performance indicators | Analysis of the reliability and integrity of the internal control system and performance indicators system |
| | 11. Planning and strategy | Availability on the electronic page of the service, or delivery to the competent oversight authorities, of the updated strategic plan, the activity plan, and SIADAP information |

performance reporting. In this context, the opportunity for change internal operations practices will depend on the culture and the features of each organization, the involvement of organizational leaders, political pressures, and the capacity to put reforms in practice (enforcement). Both the managerial or instrumental perspective (NPM) and the institutional theory (in the isomorphism perspective) could help to understand public sector accounting changes in the Portuguese context. Table 4 presents the evolution of the legal background approved by the Portuguese government in order to make compulsory performance evaluation and reporting in the Portuguese public administration.

## Conclusions

Every effective organization need to measure and monitor its performance to know how well it is performing and to identify opportunities for improvement. In this way, performance evaluation and reporting arises as a way to "reinvent" the government and to improve efficiency, effectiveness, and quality in public sector organizations and in public services at large (Hood 1995). This entry presented a short review about the processes of performance evaluation and reporting following a twofold perspective: internal and external use of performance information. Both concepts are interconnected and strongly

**Performance Evaluation and Reporting, Table 4** Legal background for performance evaluation and reporting

| Legal Diploma | Description |
|---|---|
| Law no. 8/1990, February 20 | Approves the Law of Public Sector Accounting Bases |
| Decree-Law no. 155/92, July 28 | Introduces RAFE (State Financial Administration Regime) |
| Decree-Law no. 183/96, September 27 | Reinforces the obligation to use the Annual Plan and Annual Activity Report |
| Decree-Law no. 190/96, October 9 | Introduces the obligation to draw up the Social Report for all departments and agencies of the central, regional and local government |
| Decree-Law no. 232/97, September 3 | Approves the POCP (Official Plan for Public Sector Accounting) |
| Decree-Law no. 54-A / 99, February 22 | Approves the POCAL (Official Plan for Local Government Accounting) |
| Ordinance no. 898/2000, September 28 | Approves the POCMS (Official Plan for the Accounting of the Ministry of Health entities) |
| Decree-Law no. 12/2002, January 25 | Approve the POCISSS (Official Plan for the Accounting of Institutions of the Solidarity and Social Security System) |
| Law no. 2/2004, January 15 (amended by Law no. 51/2005, August 30) | Approves the status of management staff in the departments and agencies of the central, regional, and local government. It requires the preparation of the Mission Charter and encourages management by results |
| Resolution no. 53/2004 and Law no. 66-B/ 2007, December 28 | Approves the SIADAP (Integrated Framework of Performance Evaluation in Public Administration) |
| Decree-Law no. 192/2015, September 11 | Approves the System of Accounting Standards for Public Sector (SNC-AP) |
| Law no. 151/2015, September 11 | Approves the Budget Framework Law (LEO) |

associated with the need to measure, to report, and to manage public sector organizations' performance.

Several scholars highlight difficulties and constrains in the use of performance information by different users, both for external (reporting) and internal (evaluation) purposes. The features of the politico-administrative system, the legal system, the heterogeneity of activities, the ambiguity of objectives, the managerial styles, the politics and managers' characteristics, are important factors determining the process of change within public sector entities. On the other hand, prior studies show that accounting changes and the introduction of NPM initiatives became compulsory by law in several jurisdictions, in particular in European continental countries (Hammerschmid et al. 2013; Brusca and Montesinos 2016). This is also the case of Portugal, where each public sector managerial initiative and reform is introduced after an act approved by the Government and/or by the Parliament. As illustrated in this entry, the most important reforms that have been adopted in the Portuguese governmental financial system during the 1990s were the approval of the Public Sector Accounting Bases Law, the Administrative and Financial Regime of the State, and the Official Plan for Public Sector Accounting (and other sectorial official plans approved thereafter), having as main innovation the introduction of an accrual accounting regime and the basis to produce a more comprehensive government financial reporting. Since 2015, with the approval of the new Budget Framework Law and the SNC-AP (an IPSAS-based accounting system), new requirements have been introduced with impact on the performance evaluation and report of public entities. The changes have the goal to increase transparency for citizens and to improve the information available for to take management decisions and for external report. The new budgeting and accounting changes will produce effect only after 2018.

Although these accounting changes with impact on the evaluation and report system, a great skepticism was raised about their effects on the organizational performance because of the excessive bureaucracy and regulation that features Portuguese public administration (Araújo and Branco 2009; Gomes et al. 2008, 2015).

The institutional theory, in the isomorphism perspective (normative, coercive, and mimetic), can help to understand why performance information is not used at a satisfactory level by different users. Following the institutionalists perspective, scholars assume that when reforms and managerial practices are introduced with the goal to satisfy government mandates, they will be used to obtain legitimacy and external support and not for control and decision-making purposes. When the influence of isomorphism is significant, a great deal of decoupling is expected. In this context of great external and institutional pressures, the risk of spread between formal organizational structures and actual organizational practices increases leading to a little or no effect on internal corporate operations. Despite this institutional context existing across many countries, it is most certain that NPM reforms have been changing the way public sector organizations manage and improve performance as well as their internal culture concerning public service delivery and the use of public resources.
